London Guano.—I visited the guano hill last week, and on my way met the Bermondsey waggon walking slowly towards town. It was the first time I had seen it walking; it appears that it does not trot until it comes near a village. As it passed me it smelt strongly of real guano, and it occurred to me that the bags must be dusted inside and out with the genuine article, in order to give the loam the "right flavour," reminding me of the practice of putting British brandy into French brandy casks. As soon as I had arrived at the steepest part of this "loam-guano hill" a post-master not far off passed a high compliment on the knowledge of an old Scotch bailiff. "Mr. J.," said he, "where can I purchase the best guano?" "Why, don't you know?—on the hill, to be sure." "There is no guano there." "Why," says Mr. J., "I see it passing every day;" and at that moment "the waggon" came by on its way to Mark-lane. A few houses and a small public-house occupy the left side of the hill; a newly made road, nearly opposite, winds round the north end, and is lost to view about 70 yards from the road, and in a few yards more the lane turns sharp round to the left into the bosom of the hill. It was of no use making any inquiry amongst the peasantry here; every one is making money out of the hill (the publican more than anybody), and therefore they keep quiet. I peeped into the premises, which consist of a nice cottage, with two brick-built and well-roofed sheds, about 30 feet long each. The bank of loam is about 15 feet deep, and although they have sent off many hundred tons they have not gone more than from 40 to 50 feet into the hill, and the same in breadth. It appears to be very solid and very dry, so that the further drying it on the hot plates occupies but little time; any one could get this loam a year ago for 3*s.* 6*d.* a single cart-load, and 7*s.* for a double cart-load, but now they do not want to see a stranger there at all. I was told that Mr. So-and-So was very poor 12 months ago, but now he is rich, and keeps his horse and chaise, many weeks obtaining 50*l.* for what costs him little in its manufacture. It is reported that he is very liberal to certain gentlemen, whose duty it is "to look about;" half-a-crown now and then makes them inform inquirers that this extraordinary stuff all goes abroad. Some is sent to a railway station about a mile off; some to Chelsea or Pimlico, some to Bermondsey, &c. I am afraid I shall be thought remiss for not seeing the works that were going on; but I remembered the story of the Highland guager and illicit still, "Did anybody see you come in?" "No." "Then (drawing his dirk) I am d— if anybody will see you gang ut." If gardeners will continue to purchase guano of any one, except agents duly authorised by the importers, they must expect to pay through the nose for that which they have already too much of. *Dulwich, May* 20.

Seedsmen's Lists v. *Florists' Catalogues.*—We have been hardly dealt by lately in your columns; no mercy has been shown us, and as if it would appear that there is some truth in what has been so liberally—I was about to say illiberally—heaped at our shop doors, no one has come forward to defend (if any defence can be set up) in a manly way our honourable trade. Mere skirmishing about a single-blossomed, and a double-blossomed, Pea, is, as they used to say when I was a boy, like fighting the French in an easy chair. Surely there are valiant men enough in our trade, with ample experience and sufficient research, to "break a lance" with "R. T." I say for one, give him no quarter. This subject being uppermost in my mind night and day, has almost made me forget what I had sat down to write about. A friend of mine has called to consult me respecting the purchase of a few plants for his greenhouse. He is an ardent grower and a spirited buyer, and has on one or two occasions succeeded in winning a prize of 10*s.*, which to him was a capital return for his annual expenditure of 20*l.* in plants. Why he came to consult me, a seedsman, is easily enough explained, because I always keep a few things such as he wanted in my shop window, and I grow a few likewise in my greenhouse in the suburbs, therefore he thought I might enable him to come to some decision as to what he ought to purchase, for in former years he considers that he has been grievously taken in. Through his 10*s.* prize my friend's name got into the gardening newspapers, and scarcely a post for the last month has failed to bring him a list, I was going to say, but better a catalogue, or rather book. All England poured in such contributions, and so did the Continent, and even America, so there was no lack of material from which to make a selection. From such an ample field we thought our task an easy one; but preserve us from such another! I thought of our seed lists, and derived comfort therefrom—Fuchsias, Verbenas, Pelargoniums, Chrysanthemums, &c., with their hundreds of fine names, and thousands of recommendations, completely bewildered us. My friend insisted on something distinct. Now, can any one propound a greater puzzle? I had, therefore, to relate what was told me by Mr. Neighbour, a most respectable man, of sound judgment, who was invited by an eminent cultivator of the Pelargonium to visit his collection last year, when in full perfection. After traversing two houses of magnificently cultivated plants, he turned round to a florist, and observed that they were certainly a gorgeous mass of bloom; but said he, "Why do you grow them nearly all of one sort?" The amazement and mortification of the florist may be imagined, considering that he scarcely had a duplicate in his whole collection, and he consoled himself by thinking that it was of "no use casting pearls before swine." I want now to observe that my friend, who had bought things over and over again, without any visible improvement, was desirous to do so no more, because every year he was, less or more, according to the amount of his purchases, "done brown," as he termed it. Let us now for a moment consider the case of my friend, whose labour and money were totally thrown away, and compare him with a gentleman's gardener whom one of my country customers has supplied with three kinds of Peas out of the Charlton bag and two kinds out of the Imperial sack. These being reputed always to be of comparative earliness, the gardener sowed them, and may have done so for 20 years, and obtained a succession of first-rate Peas, to the perfect satisfaction of his employer. In this, then, there is no disappointment, nor is he in a worse position than the writer of your Calendar, who of course is a first-rate judge, and only grows two kinds. Now when you have so readily lent your columns to smash us poor seedsmen, and that most unmercifully too, you will surely, in the same spirit of candour or honesty, if you like the term better, lend my friend and me a little assistance in our small way. He belongs to a class, who are, by-the-bye, the chief purchasers of these veritable, new, distinct, first-rate novelties! *A Seedsman.* [We insert this letter out of respect to the writer, but we can have nothing to do with disputes about florists' flowers; they stand in a very different relation to the public from seeds, and we rather think that the buyers of florists' flowers know pretty well how to take care of themselves. Seeds are objects of necessity, florists' flowers of fancy, and therein resides an important difference.]

Mr. Roberts's Root Ventilation.—In a recent communication from Mr. Roberts, of Eastcheap, on growing Peas a month earlier than usual, he stated that this is effected by "root ventilation." Perhaps he will help the uninitiated to the *modus operandi*, for I confess I am not *au fait*? One likes to keep pace with one's neighbours in the march of improvement if possible. *J. G.*

Plumbago Larpentæ.—I am so much pleased with this plant, that I am glad to find that it is perfectly hardy with me. Last summer I placed it out in a common border, and it flowered very well. Wishing to ascertain its hardiness, I allowed it to remain there without the least protection, and it is now making quite as vigorous shoots from the root as any of the herbaceous plants by which it is surrounded. *W. Wilkins, Nursery Grounds, Newport, Isle of Wight, May* 6.

Societies.

HORTICULTURAL, *May* 28.—J. R. GOWEN, Esq., Treasurer, in the chair; A. G. H. Battersby, Esq., was elected a Fellow. The following "Notice of alteration in the Bye-Laws" was read, and posted in the meeting-room:—"The Council hereby give notice that they propose to substitute for Chapter IV., Article 1, of the present Bye-Laws, namely, 'the admission fee to be paid by each Fellow shall be six guineas,' the following words, viz., 'the admission fee to be paid by each Fellow shall be two guineas.'"—Among subjects of exhibition was a new and extremely interesting Odontoglossum, from Mr. Loddiges, of Hackney, for which a Large Silver Medal was awarded. The same establishment also furnished Vanda teres, Aerides crispum and its pale-flowered variety, Saccolabium guttatum, miniatum, and ampullaceum (the last a valuable species, on account of the length of time it continues in bloom); Cattleya Mossiæ, and its variety, called aurantia; the bright-yellow flowered Oncidium bifolium, the orange Dendrobium Griffithianum, the rare Burlingtonia fragrans, the white-lipped Odontoglossum stellatum, and two Epidendrums.—Two red-flowered Azaleas were produced by J. Allnut, Esq., of Clapham.—Large and fine Vanilla pods, quite ripe, were exhibited by J. D. Llewellyn, Esq., of Penllergare, near Swansea, to whom a Certificate of Merit was awarded; and Mr. Chapman, gr. to J. B. Glegg, Esq., received a Banksian Medal for a dish of well-ripened scarlet Nectarines.—From the Garden of the Society came the two beautiful new Ceanothes — dentatus and papillosus; Mimulus ruberrimus, a grand kind; three species of Bossiæa, Lælia cinnabarina, Saccolabium guttatum, Cattleya intermedia, Glossocomia ovata, three varieties of Cape

Heath, an Everlasting, Zieria lævigata, Platylobium formosum, Chorozema varium, a New Zealand Parsonsia, Anadenia pulchella, Cryptolepis longifolia, two Achimenes, Dillwynia speciosa, and Nemophila maculata (a charming annual for pot culture).

Linnean, *May* 24: *Anniversary.*—The President in the chair. R. Dodd, Esq., jun., was elected a Fellow. Among the presents on the table were lithographed portraits by Maguire of the late Bishop of Norwich, the Dean of Westminster, R. Brown, Esq., President of the Linnean Society; Professor Ansted, Professor Bell, J. Curtis, Esq., C. Darwin, Esq., Professor E. Forbes, Professor Lindley, and Sir C. Lyell, presented by G. Ransome, Esq. Mr. F. R. Eagle exhibited a remarkable decumbent variety of Bromus mollis, from the neighbourhood of Lowestoffe, where it occurs in company with Viola flavicornis. Mr. Bowerbank presented, in the name of the subscribers, an oil painting of the late Bishop of Norwich, President of the Linnean Society. Mr. L. Reeve exhibited a drawing of a new species of Rhododendron, recently discovered by Dr. J. D. Hooker, in the Sikkim Himalaya. An abstract of the Society's accounts for the last year was read, and was favourable to the Society. The Secretary read biographical notices of the following Fellows, who had died during the past year: The Bishop of Norwich, W. T. Aiton, Esq., Sir D. J. H. Dickson, E. Doubleday, Esq., J. Kidd, M.D., C. Lyell, Esq., D. Mackinnon, M.D., L. H. Petit, Esq., A. T. Thomson, M.D., Professor Blainville, and Professor Kunth. At the ballot for council the following new members were elected: Professor E. Forbes, Dr. Lankester, E. Newman, Esq., W. Spence, Esq., and Sir G. T. Staunton, Bart. The following officers were re-elected: R. Brown, Esq., President; W. Yarrell, Esq., Treasurer; J. J. Bennett, Esq., Secretary; R. Taylor, Esq., Under-Secretary.——After the Secretary had read the balance of accounts, showing the expenditure to exceed the receipts, Mr. Curtis rose to ask when the next "Transactions" would be published, as none had appeared for three years, which was very prejudicial to the contribution of papers (as few persons would come forward with papers, which must either be rejected or kept back for so long a time), and country members have no other return for their subscriptions, which will amount to nine guineas for the next Part. He deeply regretted the unfavourable state of the finances, the Society being upwards of 40*l.* in debt, which must have been increased if any "Transactions" had been published. A reduction of expense might be made by publishing the "Transactions" in 8vo instead of 4to, after the completion of the 20th volume of the present series; but the best relief would be to obtain if possible a house from the Government, and he sincerely hoped that with her Most Gracious Majesty and his Royal Highness Prince Albert for patrons, it might not be long ere a suitable building would be found for the Society free of expense, as it was the oldest branch from the royal parent at Somerset-house. At all events he hoped the Society would not saddle itself with a house for a term of years. The President asked if Mr. Curtis intended to found any motion on the observations which he had made. Mr. Curtis replied that he would do so if he thought it would have a beneficial result. Mr. Graham entirely concurred in the remarks made by Mr. Curtis as to the disappointment to country members, not to receive any "Transactions" for three years. He also considered it inexpedient, in the present state of the Society's finances, that they should incur the expense of publishing such a voluminous report as that of the plants of the Gallapagos Islands, which occupied so large a portion of the last part of the "Transactions," to the probable exclusion of several short papers of domestic interest. He had not the slightest intention to disparage the value of that report; on the contrary, he highly appreciated it, and the object of her Majesty's Government in sending vessels on voyages of discovery; but for the reason before stated, he thought the report ought to have been published at the public expense. He also considered that it would greatly promote the interest taken in the "Transactions," if shorter papers on the several branches of natural history were encouraged, and brought out at regular periods. Mr. Adam White did not concur with the last speaker, considering the account of the plants of the Gallapagos to be most valuable, but considered it advisable that the Linnean collection of insects should be given to some society which would take more care of them. (How the parting with these venerable relics was to improve the condition of the Society, however, did not appear.) Mr. Solly objected to the alteration in the form of the "Transactions," considering it would not be more economical; upon which Mr. Curtis observed that Mr. S. knew nothing about it, as he was not a printer. After a few more observations, the President observed that the attention of the Council should be particularly called to the complaints which had been made. It was expected that Mr. Curtis's remark as to taking expensive premises on a long lease would have elicited some information as to the future plans of the Society, as the present lease has nearly expired, but nothing further was said on the subject. It cannot, however, fail to be a matter of anxiety to all who feel a real interest in the welfare of the Society, that they should not incur permanent liabilities on this head. *From an occasional Correspondent.* [The report is that the Linnean Society is to be saddled with a lease of the old house in Soho-square, and that the present leaseholder is to become a sub-tenant. We cannot believe that any intention of perpetrating such a job is seriously contemplated; the report has, we presume, been founded upon some misapprehension.]

Meeting at Worton Cottage, *May* 15.—Two seedling Polyanthuses from Mr. Costar, of Benson, "President" and "Regalia" are promising flowers, the latter is the better of the two, well-formed in most respects, flat on the surface, eye good and circular, lacing even and true, and good in colour. The tube is rather large and slightly angular. Both varieties appeared to have suffered a little in packing, and the trusses to have been taken off feeble plants. A number of single pips of this flower came from "J. A. C., of Newcastle," packed with some seedling Pansies in a paper box, which was so completely crushed that it was impossible to form anything like a correct judgment of them. Enough, however, remained of the former to show that they were when packed, in all probability, as fine if not finer than any varieties submitted to us this season. A twopenny zinc or tin box would have ensured their reaching in the best condition. The same must be said of a box of Auricula blooms from "L. of Falkirk," and a single pip of Sir John Moore, sent in a letter from the same party; they were past all judgment. A fine northern raised grey edged variety, grown by Mr. Edwards, was selected, and the plant was handed over to Mr. Andrews for figuring. Dr. Horner, of Hull, sent two seedling Auriculas; one, a grey-edged variety, is a very promising flower; it was past its prime, and had evidently suffered from the weather. The tube is rather too large, but of a fine deep waxy yellow, and well filled with anthers, the paste very fine and smooth, and a perfect circle; the ground colour a violet purple, leaving a proper margin of grey; the outer circumference of the flower round, and the pips (three) quite flat. This flower possesses decided novelty, being a grey with violet ground, and with white foliage. The second, a green-edged flower, did not please us, and we imagine is inferior to "L.'s" Sir John Moore beforementioned, when the latter is seen in proper condition. *Cinerarias.*—"H. B., Hastings," sent two trusses of a seedling, put into a good round tin box, but without anything to retain them in a quiet position; they were consequently spoiled. "M., of Taunton," sent, for the second time, a truss of a seedling, finer in colour than Salter's Clementine, not so good in shape, and with the decidedly bad habit of reflexing very greatly. *Calceolaria.*—A Calceolaria came from "M. W., Whitby," not sufficiently circular, and too large in the throat; ground-colour buff, prettily striped and spotted with dark rich brown. We hope this is a mere precursor of some fine things from a spirited raiser. *Pansies.*—Mr. Edwards produced a bold-eyed white ground seedling Pansy; the rays of the eye radiating into the margin disqualify what would otherwise prove a very useful flower from taking any place in a competing stand of first-rate varieties. Beside it Mr. Turner placed the finest bloom we have yet seen of his seedling, Mr. Beck, and some other leading varieties. *Seedling Pelargoniums.*—Three trusses came from "S., Windsor." No. 1 is a most charming rich crimson maroon top-petalled flower, small, but of excellent quality. The censors would request a sight of this again with real address. Nos. 2 and 3 possessed many points of merit, but are altogether inferior flowers to their companion. We must say the same of a seedling from "H., Putney-heath;" as the places are not very distant from each other, "H." may like to compare it with some varieties of the same colour at Worton Cottage, and so judge for himself, which is very desirable.—Petunias from "M., Taunton," possess little merit; the white is large but coarse, the lilac is very delicate in colour, but not superior to many we have seen. This is the verdict that must unavoidably be passed on scores of seedlings, for distinct character and colours are very hard to obtain. A seedling Erica, Ne plus Ultra, from Mr. Epps, Maidstone, was given to Mr. Andrews to take a coloured memorandum of, in case it should prove novel, which has to be decided by comparison with the tricolor varieties already in cultivation. N.B. The censors would earnestly impress upon raisers to give more attention to the careful and secure packing of their flowers. It has been a source of great regret at this meeting to see how much postage has been paid absolutely for nothing, because their repeated directions on this subject have been neglected.

Review.

The Heiress in her Minority; or the Progress of Character. 2 vols, 8vo. Murray.

These two volumes contain the result of much reading and diligent note-making. They in fact exhibit the contents of a very miscellaneous and voluminous common-place book, thrown into the form of a domestic story. The heroine is a young lady of impulse—inexperienced, thoughtless, Irish, and well meaning, for the improvement of whose character her friends and advisers are supposed to have instilled into her mind a profusion of gossip of all sorts, religious, heroic, geographical, botanical, classical, economical, entomological, historical, horticultural, &c.; arranged much in the order, or rather disorder that is expressed in this enumeration. To all impulsive, inexperienced, thoughtless, well meaning young ladies the work may be particularly recommended. And so it may to those who possess few of those qualities; for its pages abound in useful and amusing information, among which is a good deal of reasonably exact natural history.

We must not *criticise* a work of this kind; its mistakes are not alarming, its faults are far from glaring, and both are much outweighed by its utility. A few short examples will serve to indicate its style.

Economy of Time.—"How was it possible to divide his time among so many objects?" said Evelyn; "a single visit in the country, a morning's ride, accounts, letters, looking at his workmen, might each have furnished occupation for the day, and would each engross so much time!" "Certainly they did; but you know, Evelyn, as a trunk holds more when each article is smoothly folded and skilfully placed, so may the hours of the day be wonderfully stretched by those who are methodical in arranging their time. My grandfather always rose very early, usually at five, and he went to bed at ten. By this means he had the uninterrupted enjoyment of the prime of the morning; and before he met his family at breakfast he had read for some hours, had written his letters, and given directions to his steward for the day."

The Sawyer Beetle.—"It is the famous Cerambyx (Prionus cervicornis), of which I am sure you have read. Some incredulous people have doubted the truth of those travellers who have described it; but I assure you I had the pleasure of being myself an eye-witness of its actually sawing off a branch of a tree. Having first seized the branch with its powerful serrated mandibles or jaws, it then flew or whirled itself round and round like the vanes of a windmill, and in no very long time the job was fairly completed. I watched the whole process; and when nearly cut through, the weight of the branch, which was almost as thick as my wrist, brought it and the insect to the ground together. You see it is large and powerful; above 5 inches in length, and rather showy in appearance, as the wing-covers are striped with yellow."

Candelabra Tree.—"You have not mentioned any of the Cactus tribe," said Mrs. Manvers: "are they not very abundant in South America?" "So abundant," replied Charles, "that it would be endless to attempt to describe them; yet some are very remarkable. I have made no collection of them myself, but I might have mentioned to you one of such uncommon size, that I measured and noted its dimensions at the time. It was a Cereus, and really deserved the name of a tree, but its structure was of a different nature. The stem was above 6 feet in circumference, and the trunk rose 10 feet before it divided into numerous erect branches, some of them 40 feet high."

What we most regret to see is the number of instances of erroneous spelling, in proper names, such as cervi*carnia* for cervicornis, Alstra*mera* for Alströ*meria*, Bogotà de Fé for Santa Fé de Bogotà, hasti*le* for hasti*lis*, Mad*herea* for Mad*huca*, &c. &c.

Garden Memoranda.

Mr. Groom's Tulips.—The present season has been unfavourable to a fine display of Tulips. This fact, the last South London Floricultural show amply proved. Notwithstanding, however, the prevalence of dry north-easterly winds, which we have experienced, Mr. Groom has had a good exhibition of this favourite flower. His best bed, 120 feet long, and containing not less than 2000 flowers, has been nearly as fine as we have ever seen it in any former year. The following favourite sorts were in good condition when we saw them. Bizarres:—Polyphemus, Duke of Devonshire, Catafalque, Emperor of Austria, Nourri Effendi, Marshal Soult, Strong's King, Platoff, Everard, Pompe, Garrick, Optimus, Prince of the Netherlands, Countess of Wilton, Louise, Lord John Russell, Earl of Lincoln, and Duke of Norfolk. Byblœmens:—Victoria Regina, Laurence's Friend, Rubens, Louis XVI., Imperatrix Florum, Michael Angelo, Earl of Haddington, Violet Alexander, Duke of Buccleuch, Claude, Monte, Bijou des Amateurs, Desdemona, Bloemart, Homer, Lady Sale, and Camarine. Roses:—Duchess of Sutherland, King of Saxony, Cameuse de Crai, Cerise Blanche, La Tendresse, Claudiana, Emily, Aglaia, Lady Peel, Catalani, Triomphe Royal, Cerise Belle Forme, and Ponceau très Blanc. In addition to the above the collection contained some novelties. Dr. Horner and Prince of Wales, new bizarres, are promising flowers, and so are one or two others, which we hope to see again.

Miscellaneous.

The District of Biddulph Moor.—We have been requested to insert the following extract from an "occasional paper of the Pastoral Aid Society, which gives a graphic but melancholy picture of the state of the district of Biddulph Moor, in behalf of which (see Advertisement) Mr. Bateman's Orchids are to be sold: "The district is situate at the north-western extremity of the county of Stafford, and embraces portions of three parishes. In its physical aspect this district is wild and romantic, and contains large tracts of land, that, in consequence of their great elevation and exposure, have not been brought into cultivation. Here, almost beyond the pale of ordinary life, exists a large and rapidly-increasing colony of human beings sunk in the lowest depths of moral degradation, but presenting many features of deep and peculiar interest. Originally (as it is believed) of Moorish descent, they were introduced from Spain, about the 16th century, by one of the feudal lords of this parish, and being speedily cast upon their own resources, they established themselves upon the neighbouring heights, where they have ever since remained, as it were entrenched against the humanising power of civilisation on the one hand, and the elevating influences of religion on the other. While their features have much of the Moorish or gipsy cast, their mode of life and habits are quite in conformity with this supposed origin. They live crowded together in the most miserable hovels; and would rather undergo almost any privation than submit to the drudgery of regular labour. Having moreover, by long unmolested occupation, established a right of freehold in their houses and tenements, they not only exercise a most important influence in county elections, but maintain a spirit of proud exclusiveness in regard to the

population of the surrounding valleys; and to such an extent is this carried, that it has been found impossible to prevail upon them even to send their children to any school frequented by their lowland neighbours. In the summer the men spread themselves over the country, carrying pots or other wares for sale, while in the winter they chiefly subsist upon Potatoes or other produce of their plots of land. As might naturally be expected among such a nomad population, crime abounds, and in its most awful forms. Not only are the lawlessness, the dishonesty, and drunkenness of the district proverbial, but (on Sundays especially) scenes of the most open and revolting licentiousness may be witnessed in broad daylight; while theft, burglary, murder, and even fratricide, and other crimes too shocking to be mentioned, have within the last few years attracted the attention of the philanthropist to this unhappy spot. It has, however, been found impossible to reach the evil by means of any existing machinery, lying, as the district does, at the extremity of three large and populous parishes, the ministers of which are already greatly overworked and underpaid."—*Sept.*, 1849.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

It is at all times, and with every one, an important object to preserve plants in flower as long as possible. To this end, as soon as their blossoms are perfectly expanded, they should be removed to a cooler atmosphere than that in which they have been grown, and carefully shaded from gleamy sunshine. To counteract the drying effects of strong currents of air, which are unavoidable in hot weather, the air of the house should be kept moist by frequently sprinkling the floor and walls, or both plants and flowers will flag, in spite of the shading; much, however, may be done by hanging a thin bunting before the openings, and occasionally syringing it; this breaks and cools the current of air as it passes through it. In dull or damp weather, however, a directly opposite mode of proceeding must be pursued; moisture is then injurious, and must be carefully avoided; and the plants should stand sufficiently far apart to secure a full and free circulation of air amongst them. Let no blossoms remain after they fade, nor ever allow the energies of a plant to be exhausted in producing seed unless it is positively required. Plants of which it is desired to make large specimens in the shortest possible time, should not be allowed to produce flowers until they have attained the desired size. All specimen plants should have plenty of room, and should be occasionally turned round, in order to prevent their growing one-sided. Leaves of Gloxinias should now be inserted into pots of sand; these, if well managed, will form strong young bulbs this season, and will flower during February and March in 6-inch pots. Many greenhouse plants, and others from intermediate houses, of a sub shrubby or herbaceous character, as Salvias, Cinerarias, Begonias, Primulas, Calceolarias, Veronicas, &c., may now be planted out on warm borders in rich soil. These will form handsome plants by the beginning of September, when they will be in nice order for taking up and repotting.

FORCING DEPARTMENT.

Pineries.—Plants just showing or swelling their fruit will be considerably benefited by receiving liquid manure every alternate watering till the fruit begins to ripen. If the plants, which are just on the point of showing, are in pots, it will be an advantage to shift them immediately into larger ones; to top-dress them with some rich turfy loam, or to turn them out entirely into the soil, which is by far the most preferable method. Where the pot system is pursued, many of the plants, especially of the young stock, will require repotting, and at this time they should receive a large shift, as their most active growing season is now approaching. After potting a closer and moister atmosphere must be kept up for a few days, till they begin to root into the new soil. No plant stands in greater need of shading during bright sunshine than the Pine-apple; but as it is not only unnecessary, but injurious in dull weather, the canvas should be so adjusted, by means of rollers, that it can be applied or removed at pleasure. Vineries.—If the fruit is all gathered in the earliest house, the Vines should again be treated with a moderately warm atmosphere, and syringed daily, to destroy insects, and to keep the foliage in a healthy state as long as possible, that the Vines may have every means of recruiting their energies for next season. At the same time give liquid manure to the roots if they require watering, that they may have every chance of regaining their strength, after having been forced at an unseasonable period.

FLOWER GARDEN AND SHRUBBERIES.

All is now hope and activity with the enthusiastic gardener, in anticipation of the speedy realisation of the dreams of floral splendour, which he has been indulging in for the last six months, and for the accomplishment of which he has, during that period, striven most energetically. While this state of things is gradually developing itself, let due care be taken to have every part of the grounds in the most careful order. As the young plants progress, some will require pegging down, and others tying up. For the former purpose, small birch hooks are most substantial for plants of a stiff habit; but many plants, if once fixed in their position, retain it, either by emitting roots, or by the natural inflexibility acquired by their stems. For the fastening down of such plants, we reserve all the roughest and coarsest of our bass matting, and cut it into pieces about 6 or 8 inches long; these we form into loops, which clip the shoots, and the ends are fastened into the ground with a blunt dibble In performing this operation, the heads of the plants should be turned towards the north, as the young laterals will be drawn by the light towards the other points of the compass, and by this means the beds will appear well filled from all sides. The young plants in the beds will be considerably benefited by stirring the soil between them, especially when it has been caked over by rain. This operation will, at the same time, destroy weeds, and the ground will keep clean twice as long as it will with merely hoeing and raking.

HARDY FRUIT GARDEN.

The Strawberry beds should now be mulched or covered with some clean material, for the double purpose of keeping the fruit free from dirt in wet weather, and of preventing excessive evaporation in a dry or parching summer. The old-fashioned practice was to lay clean straight straw between the rows, and from this the fruit derived its name; but the unsightliness of this plan has long since condemned it. The material most generally used, and which answers the purpose very well, is the short Grass cut from the lawns; but, in preference to it, we would recommend a row of plain, dark-coloured roofing tiles, to be laid on each side of the plants. These may be procured at a trifling cost from the manufactories, as those which are generally denominated *wasters* are good enough for this purpose. Their colour gives to them the valuable property of absorbing heat, which facilitates the swelling and ripening of the fruit; and, if they are laid with the slightly-hollowed side downwards, they will keep the fruit clean and dry. Before anything is put on to the ground, it should be loosened with a fork between the rows; and, if dry, it should be well watered with liquid manure, which, with the mulching or tiles, will generally be all that is required during the season. At the same time, a good dressing of dry soot, under the leaves and amongst the stems of the plants, will assist their growth, and destroy vermin.

KITCHEN GARDEN.

Do not consider it too much trouble to employ head and hands to prevent or destroy birds and insects, which are now very actively at work robbing you of seeds and plants, and unless timely checked will give you a barren wilderness instead of a fruitful garden. Old spare roots of Carrots or Parsnips may be turned to a very good account by planting them in beds infested with wire-worms; these will attract the enemy from other plants, and if daily examined will in time rid your ground of this nuisance. The next time such ground is bare, do not forget to favour it with a good dose of salt, as they exist in that state which is so familiar to us for several years without undergoing any change, and thus afford an opportunity for the salt to act upon them. It is some satisfaction to know that they are only larvæ, and therefore do not breed; and the perfect beetle chooses for the deposition of her eggs ground which is not frequently stirred. The Leek is becoming so favourite a vegetable that it will well repay a little additional care in its cultivation, as its value depends upon the production of a long, thick, well-blanched stem. They may be grown in one season to 14 or 16 inches long, and upwards of 2 inches thick; and from their closeness together they form one of the most productive of kitchen garden crops. The ground should be trenched 18 inches deep, the bottom of the trench stirred up with a fork, 4 inches of good rotten manure laid on to it, and over the manure the whole of the soil from the next trench. If the ground has not been prepared previously, it is a very convenient course of proceeding, to carry on the planting and trenching together, so as to prevent in a great measure the compression of the soil after or during planting. This is the more necessary in the method about to be described; as raking or forking about the plants will be impossible for some time. The plants should be put in about 6 inches apart, and 9 inches from row to row. Premising that the soil is sufficiently moist to prevent its falling in, the holes for the plants should be made 14 inches deep with a dibber 2 inches in diameter, and into each of these a plant should be dropped and watered. The plants are thus placed in the most favourable position for growing, which they will continue to do till Christmas. As weeds are advancing rapidly, and must by some means be destroyed, and as forking or stirring the soil among the growing crops is highly beneficial to them, let this method be practised. Cutting should now be discontinued entirely from a portion of the Asparagus beds, especially from those intended for forcing early next winter. A few rows of Cauliflowers, Cabbages, and autumn Broccoli should now be planted at intervals of from 10 days to a fortnight, by which they will come into bearing in similar succession. The strongest plants should be selected from the nursery beds, and should be lifted and transferred with as much earth as will hang to their roots.

State of the Weather near London, for the week ending May 30, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

Ants: *Old Friend.* See p. 293 of the present year's volume.‡

Azaleas: *K V R.* After they have done flowering keep them in the greenhouse, and repot them if they require it. When they have made young wood they may be placed out of doors for a few weeks in autumn, if the weather is favourable.‡

Geranium House: *Z.* It is immaterial whether it faces south or south-east.‡

Green-fly on Roses: *J M.* Envelope the bush in a para-petticoat (parasol and petticoat), and fill the interior with tobacco-smoke from one of Brown's large sized fumigators. Tobacco paper, a bad material, may be obtained in any of our large towns.‡

Guano Water: *O O.* No fixed rule of application can be given; a dose that would suit one sort of plant might kill another kind. It is much safer to use it weak and often, than to give strong doses at long intervals.‡

Insects: *Bort.* Your grubs found in a Pelargonium pot are the larvæ of those pretty little shining green flies with flat wings (Sargus cupreus) so often seen sitting on the leaves of plants. We believe both them and their larvæ to be quite harmless. *W.* — *W L.* The smaller brown beetles feeding upon the bark and wood buds of the Apple are a weevil called Nemoicus oblongus. The green ones found on the leaves are Polydrusus mali, which do no damage. The former should be collected by beating the branches over a sheet laid on the ground. *W.*—*S W.* The beetles which have done so much mischief to your grafted Roses are the weevils Otiorhynchus sulcatus. We know no better mode of checking their ravages than by laying a cloth under the trees and shaking them well at midnight, when the insects drop down on the least alarm, and must be destroyed. *W.*—*Sub* The insect sent is the domestic Lepisma saccharina found in cupboards and pantries; it undergoes no transformations, and does no harm. *W.*—*L R T.* The insects sent are a species of hair worm (Gordius), the natural history of which is enveloped in much doubt. In what position were they found? *W.*—*W H.* Your insect is a common water beetle (Acilius sulcatus), which, whilst on the wing, mistook the glass of your Melon-frame for water. *W.*—*E S.* There are pins expressly made for entomologists, which may be had at Messrs. Knight and Son's, Foster-lane, London. *W.*—*R M.* Your queries on the insects which have attacked your Pear leaves would require a small volume to answer them completely. The black spots on the leaves sent have not, in our opinion, been caused by the attacks of insects. The discoloration is quite of a different character from the autumnal blotched appearance, which is caused by the larvæ of a small moth (Argyromiges scitella) inclosed within the leaf, for the destruction of which no better remedies can be adopted than those which you have employed. The larvæ you sent were of course crushed to pieces, having been sent without the slightest protection. Among them we recognised the caterpillar of the tortrix, which spins the leaves together, and a looper caterpillar, most probably that of the winter moth. *W.*—*S F.* The insect sent is not the wireworm; it is the larva of a staphylinus, and feeds upon other soft-bodied insects. *W.*

Jonquils: *A J B.* Grow them in a warm south border. Let the leaves die down naturally. Take them up in the autumn, and pot them for forcing. When forced return them to the open ground, and give them a year's rest.

Lawns: *Sub.* Where they are perfectly level a mowing machine may be employed with advantage; but in most cases we would prefer a scythe in the hands of a clever workman.‡

Melons: *G A.* We are unable to say what is the matter with your Melons. The very clear statement accompanying the leaves seems to show that none of the common causes of disease are in operation. It will be necessary to examine the soil; has any raw or fresh animal matter been used in it?

Names of Plants: *W Spriggins.* Kennedya rubicunda.—*R E.* Epidendrum tripterum.—*E S.* Perhaps Linum arboreum.—*C M.* Genista cinerea; the Arabis is indeterminable in such a state, and with neither seeds nor any account of its history. —*A D H.* Tiarella cordifolia.—*A E N.* Genista cinerea.—*Jas. Clift.* Cyrtopodium Andersonii.—*Oak tree.* 1 and 2, the common Norway Spruce, of which there are many slight varieties; 3, two kinds together, the bit, having the leaves in a single row each side of the branch, is the Silver Fir; the other piece and No. 4 is the Balm of Gilead Fir.¶—*J.* It seems to be Ribes atropurpureum.—*A Constant Sub.* It is Bistort. You can eradicate it only by careful tillage, aided by thorough drainage. Keep pulling it up, and like all other perennial weeds it *must* gradually die.—*O P.* Sophora Jasminum azoricum has white flowers; J. heterophyllum has yellow flowers; J. chrysanthum is an alias of J. revolutum.—*J K.* Oncidium tetrapetalum and Dendrobium Heyneanum. —*Offa.* The violet variety of Œthalium septicum.—In two cases correspondents have favoured us with such numerous inquiries, that while waiting for leisure to answer them the subjects of the inquiries have perished. — *C L.* Gongora truncata and some Melastomad.

Peach Leaves: *A B C.* They are blistered—an unsightly deformity, concerning which much has been said in our volume for 1849.‡

Misc.: *J C S.* We are unable to say what is the matter with your Cuphea leaves. The air in the pit in which they have been grown is possibly too dry for them.‡—*L B S.* Dahlias are generally increased every year from cuttings taken off the "old roots;" but the latter often flower as well the second year as the first. Gas-water from the gas works, if you can get it, poured over your heap of leaves and Grass, will have a tendency to hasten their decay.‡—*E S.* You may "stop" the shoots of the Heaths and other plants you mention, when they have done flowering.‡

SEEDLING FLOWERS.

Calceolarias: *J L M.* Prettily marked varieties, but too small.*—*A P.* Yellow, spotted with brown; and creamy white, spotted with brown. Both nice sorts, but hardly large and round enough.*

Double Polyanthus: *J H Y.* An interesting variety, and, if constant, worth preserving.*

Mimulus: *M H.* A pretty sort, having considerable resemblance to M. ruberrimus.*

Pansies: *J F.* Received in bad condition, but apparently inferior to many now in cultivation.*

Pelargonium: *J M.* Dropped to pieces when received.*

Petunia: *S S T.* Bluish purple, and worth growing, on account of its colour.*

Roses: *C and Co.* The bud of "Jenny Lind" did not open with us, and therefore we can offer no opinion of its merits. It is very fragrant.*—*Anon.* Your seedling was too much faded when it arrived for us to give a *safe* opinion of its worth. Its colour is fresh rosy pink, resembling that of the Duchess of Sutherland. Form cupped and good, foliage large and handsome. A full and apparently promising flower.*

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

BENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1s. 3d. to 1s. 6d. per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7d. to 9d. per foot. HEATING BY HOT WATER.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works Greenwich.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

Country Dealers and Agents supplied.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10 0 0
Clover Manure, do.	11 0 0
Turnip Manure, do.	7 0 0
Superphosphate of Lime	7 0 0
Sulphuric Acid and Coprolites	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 15s. per ton; and for 5 tons or more, 9l. 10s. per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, containing Ammonia, Phosphate of Lime, Potash, Soda, Magnesia, Silicate of Potash, &c. Price, delivered alongside a vessel, or any Wharf in London, 8l. per ton. It is sold in a finely-ground dried powder, by the Patentee, at No. 3, New London-street, Mark-lane, London.

Superphosphate of Lime, Gypsum, Sulphate of Ammonia, Sulphate, and Nitrate of Soda.

MARQUEES, SUN-BLINDS, RICK CLOTHS, &c.—Manufactory, Old Kent-road, facing the Bricklayer's Arms Railway Terminus, and 17, Smithfield-bars, London.

"The guests are arriving; my villa has got
Quite a park-like appearance—a beautiful spot;
The band on the lawn, in the spacious marquee,
This tent for our dinner, and that for our tea."

Marquees and temporary rooms superbly fitted up for fetes, &c., on most moderate terms, by THOMAS EDGINGTON and Co.—Tents of every description, Rick-cloths, with poles, &c. Tanned Netting, for the protection of fruit-trees from frost, blight, and birds, and for the security of fresh-sown seed either in gardens or fields, at unprecedentedly low prices, viz., 1d. per square yard, or 200 yards for 14s; or 500 yards for 30s, or 1000 yards for 50s. Sold to gardeners and shopkeepers by the cwt. —New Archangel Mats and Scrim Canvas for wall fruit; Tarpaulings for houses under repair, on hire. Orders and inquiries per post immediately attended to.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

The terms of the School can be had on application either personally or by letter.

HYDRAULIC ENGINES, WATER RAMS, &c. on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.

Direct to JOHN LEGG, Cheltenham.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

Works, Sumner-street, Southwark-bridge-road.

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8s., 15s., and 21s., casks inclusive.

PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence: not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2s.; rich brown, 2s. 9d.; greens and light colours 4s. per gallon.

G. BELL and Co., 2, Wellington-street, Goswell-street, London.

TURNIP SEEDS.

DUNCAN HAIRS having personally superintended the selection and growth of the Turnip Seed he offers, can with confidence recommend them as genuine. Likewise, AGRICULTURAL SEEDS of every description, of first-rate quality and low in price. Catalogues with prices free.

Garden Tools, Nets, and every article connected with the trade wholesale and retail.

Seedsman and Florist, 109, St. Martin's-lane, Charing-cross.

TRINIDAD PITCH FOR MANURE.—ASPHALTE MANURE.—"At a weekly council of the Royal Agricultural Society a statement was read from Earl Grey, showing the satisfactory results obtained by Vice-Admiral the Earl of Dundonald, in command of her Majesty's naval forces on the West Indian station, from manure prepared from the Asphaltum of the great pitch lake in the Island of Trinidad, and tried in the Government Garden at Bermuda."—*Daily News.*

Farmers and others desirous of trying experiments with this material for Turnip and other crops, can be accommodated with the above material pure as imported, but reduced to a fine powder, at the rate of 3l. 15s. per ton, inclusive of hogsheads, or at 3l. 5s. per ton in lump. No extra charge for carriage to any Wharf or Railway Station in London. Post-office orders payable to LEWIS JAMES, Cross-lane, Eastcheap, London, will meet attention by the prompt delivery of the quantity ordered.

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6s. per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7s. 9d. a set. Sword-scrapers for Gardens, 1s. 2d. each. Patent Fumigators for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. BOOBBYER and Co.'s (late STURCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

The Agricultural Gazette.

SATURDAY, JUNE 1, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY,	June	5—Agricultural Society of England.
THURSDAY,	—	6—Agricultural Imp. Society of Ireland.
WEDNESDAY,	—	12—Agricu tural Society of England.
THURSDAY,	—	13—Agricultural Imp. Society of Ireland.

A WEEK or two since we directed attention to the fact that there are yet estates in England in which the land is cultivated on the three-course system of two white crops and a bare fallow. That such an ignorant and wasteful course of husbandry should be in existence in the 19th century might well have been doubted, had not the owner of an estate on which it was practised published it to the world, in a letter addressed to his tenantry.

The Marquis of LONDONDERRY deserves some credit for his determination that his land shall no longer be cultivated in a style fully a century behind every well farmed portion of the kingdom. He has intimated to his tenantry that the three-course system at present followed shall be discontinued. The Wheat is to be sown with Clover this spring, and he insists that a green crop or a drilled and manured crop shall always in future be grown between two white crops.

This summary method of getting rid of an obsolete practice is perhaps the best that could have been adopted. But that it could be adopted at all, tells a very serious tale as to the position of the tenantry. They must evidently be yearly occupiers. The owner of an estate on which two white crops and a fallow is the course of husbandry pursued, and on which the tenants are from year to year, has certainly made the best possible arrangement for securing "a constant process of abstraction and a gradual reduction of the good quality of the soil." There are, it is to be hoped, few estates in Great Britain under such a combination of disadvantages, but as there are sadly too many on which the farms are still let from year to year, and as the present time seems for some reason or other to be suitable for making changes, we will do our best to point out the folly and ignorance of such a course of management. On the continent, the class synonymous to the English farmer is nearly unknown. The estates are there cultivated by the serfs, who pay to the owner a certain proportion of the produce in kind. The only difference between the English farmer upon a yearly holding and these serfs, is that the former has commuted this payment in kind into a money rent. In both cases there is not merely the absence of all inducement to improve, but as increase of crop in both cases entails increase of rent, there is also a positive premium on bad cultivation.

However anxious a landowner may be to improve his estate, if it be of any extent, it is obviously impossible for him to ferret out those endless changes and improvements which must go on in every corner of it. But the tenant from year to year, or the serf, has no inducement to make any such changes or improvements; the former, because he has no security, and the latter, because he would by this means only entail a greater burden on himself. It is often a thankless task to reason with a man for his own good; and when the adoption of the path we recommend suggests an acknowledgment of error in his previous proceedings, it becomes still more so. This is precisely the position of the landowner who lets his farms from year to year.

There is not only an absence of every inducement to improve in the situation of a yearly tenant, but it must necessarily check in some degree the ordinary operations of husbandry. Under ordinary circumstances the farmer does not reap the full benefit of the manure employed in a shorter time than three or four years. How, then, can it be expected, that, having only one year's interest in the land, he is going to sink his capital for three years? But, if no other argument will convince the landowner of the folly of this practice, let him visit the county of Norfolk, and let him compare the rent-roll of Mr. COKE, when his farms were let from year to year, with the rent-roll of the Earl of LEICESTER when long leases are granted. Let him visit the best-farmed counties of England or Scotland, and he will always find that they are those in which leases are granted. During the days of coach travelling we have often been able to detect the boundary fence of the estate where the farms were let from year to year.

The Irishman, who kept his pig in his house to save the expense of a pig-stye, "because sure, your honour, I may not have the bit land another year," is the perfection, the *jewel* of yearly tenants. He spoke their feelings if he did not use their very words. The farmer, who assigned as a reason for his bad farming that for "the last seven or eight years he had expected his landlady to die," and was, therefore, taking advantage of the land, until its value was reduced one-half, was but actuated by the common principles of business.*

How a manufacturer would stare if asked whether the ground occupied by his mill was held on lease, or from year to year. A mill-owner, under the latter circumstances, would be considered a madman, a fool, a person without common sense. When will the time arrive, when the owner who lets his estate, and the farmer who takes the land, without the necessary security of a lease, shall also see their folly? When will the owner become convinced that by so doing, he checks improvement, robs his estate, and lowers his rental?

The time has now gone by when the landowner can safely turn his back on his estates for 30 or 40 years, except for the purpose of receiving his rents. He will soon be convinced by his pocket, if no other argument can reach him, that even *landowning* is a business, as well as farming, in which the receipts exactly correspond to the attention bestowed, and upon the security afforded for the investment of capital in its cultivation as well as in its purchase.

The landowners of this kingdom have paid too little attention to the management of their estates. Whilst Mr. CAIRD, and others of that class of men, have stirred up the farmers, to the advantages of high farming, any one who could, in like manner, convince the owners of the advantages of *high landlordism*, attention to the management of their estates, and a leasehold tenantry, would do them a great favour. For some reason or other our homely advice seems opposed to the fashionable habits of our landowners; the agents and the half-yearly receipt of the remittances are the only connexion which too many of them care to acknowledge with their estates. But such practices can no longer be followed with safety. Without pretending to the "sharpness" of the American, there is yet too much go-ahead in our composition for the owner of ever so large an estate not to be left behind, if he venture to rest on his oars.

Our remarks have no reference whatever to Lord LONDONDERRY, except to hold him up as an example to others. If his estates have been previously farmed on a bad principle, he can but alter it; if the buildings on his farms are insufficient, he has offered to provide the necessary accommodation. Let other landowners do likewise, or suffer the inevitable penalty in diminished rent rolls and impoverished estates.

So long as the ordinary course of cultivation was sufficiently remunerative to satisfy the English farmer, and the profits of his grain crop paid the losses of his green crops, and afforded him a fair return for his capital beyond, he might hesitate

* Evidence of Mr. OUTHWAITE, on Agricultural Customs.

to adopt new systems which involved risk and trouble with uncertain results; but now that it is clear that if he expects to make a profit he must make the intermediate crops pay for themselves, and not depend upon the grain crops, the farmer may well turn an attentive ear to any suggestions which may be offered him for turning the least profitable part of his system into one more remunerative; for if he could make more by his other crops he would of course become less dependant for his profits on the price of Wheat.

We find that the price of Wheat in Belgium has been, on the average of the last 10 years, about 52*s.* per quarter—a price which we imagine the majority of English farmers do not expect to realise for their Wheat for the next 10 years—and yet the Belgians have still considered the Flax as their golden crop, and looked to it for greater profit than from the Wheat crop. Why should not the English farmer do the same? *What advantage has the Belgian farmer over the British in the growth of Flax?* It does not appear that either the climate or the soil of Belgium generally are more favourable to the growth of fine Flax. We know that in Ireland much has been produced of excellent quality. Still, in spite of the exertions of Mr. WARNES and other zealous advocates, the cultivation of Flax has extended very little in this country. The reasons seem obvious. So long as the growth of Flax entailed upon the farmer not only the trouble and risk attendant upon sowing, weeding, pulling, housing, and threshing out the seed, common to this and most other crops, but also the steeping, drying, and scutching—nice and troublesome operations in which he has no skill or experience, and which if he ever attempted he probably gave up, disgusted at the trouble and loss which attended his imperfect means of executing them—added to the further difficulty which sometimes occurred to a single individual in a district in finding a satisfactory market for his fibre when prepared—no wonder that English farmers have been found little disposed to embark in so troublesome and uncertain a business, and have consequently not been tempted to try Flax growing. But are not circumstances now altered? when most farmers are looking not to make large profits but to save themselves from serious losses, at the same time that the difficulties which have hitherto beset the Flax-grower are greatly smoothed.

By the patented system of steeping Flax in warm water (which is described in the *Agricultural Gazette* of Nov. 11, 1848, and as to which abundant information may be obtained by application to the Flax Improvement Society in Ireland) Flax may be thoroughly retted in 60 hours, instead of taking from 7 to 21 days, and this may be carried on at any season, and all the year round, instead of depending upon the fluctuations of weather and temperature, and all the uncertainties of climate, as heretofore. It can be carried on, too, in tanks attached to the scutching mills, and the water warmed by steam from the engine which works them. With such facilities it may fairly be supposed that there would be no difficulty in finding parties ready to set up scutching mills in any part of the country where Flax was grown to a sufficient extent to keep them employed, otherwise it might be worth while for a party of agriculturists to establish a company for that purpose.

If the farmer after threshing out his seed could sell his Flax-straw in a rough state and deliver it at the mills, he would not have more trouble with this than with his other crops, with an equal certainty of a market. For, already, there is an enormous demand for Flax in this country, of which we import in seed, and fibre, and oilcake, to the value of some millions annually. This demand, it is believed, might be almost indefinitely increased if the price was slightly lowered so as to approach that of cotton. How many fabrics, now made of cotton, might be manufactured of linen with immense improvement to their quality? and if to any extent the linen manufacture could supersede the cotton, how great would be the national gain. If instead of being dependant upon the capricious and uncertain supply of a raw material of foreign growth, and the produce of slave labour, like cotton, for carrying on the most important branch of our manufacturing industry, we could keep our mills going from the produce of our own fields, all parties in this country would be enriched, and such a crisis as some fear is even now hanging over the cotton trade might be avoided. At present we are dependant upon Belgium for the greatest portion of our first quality of Flax, *but what advantage has Belgium over this country in the production of such quality, if it does not arise, as we have shown, from soil or climate?* No doubt at present the Belgian farmer owes his success in the production of fine Flax to his superior management, in which long experience and his well-known industry and minute care have given him the advantage. Now, in the art of cultivation, there is no reason to suppose that the improved English farmer is a whit behind the Fleming, so that there is little doubt he could raise as good a crop of Flax. But while he was dependant for the subsequent management of it upon the unskilled treatment of his agricultural labourers, and had to entrust the delicate operations of steeping the Flax and separating the fibre to their rough hands, he had little chance of producing an article which could compete with one which had been prepared with all the experience and minute and careful attention of the Belgian farmer. But if the straw, as soon as threshed, passed at once to the manufacturer, and was consigned to the care of skilful hands, whose attention was devoted the whole year round to the preparation of Flax, there is no reason to believe that they would not soon equal the most skilful Belgian in the performance of their daily task. We write from Gloucestershire, and fancy we can cast our eyes upon many mills in the valley of Stroud, which might be profitably converted to Flax scutching, possessing admirable water power and railway communication, and a population accustomed to mill labour. No doubt there are plenty of other localities in other counties equally favourable.

Whatever may be the range of future prices of corn, highly cultivated lands must have a decided advantage over wilder districts in the production of a fine quality of Flax, even if superior climate, a virgin soil, or the cheapness of labour and low taxation may give some other countries an advantage in growing cheaper corn. Anything therefore which could increase the profit of high cultivation in this country, and encourage its extension, is well worthy the attention not only of the owners and occupiers of land, but of all persons interested in the advancement of their country.

Hitherto the British farmer has devoted his energies almost exclusively to the production of food, and while he was protected in so doing, he had, under a sort of tacit pledge, to keep the market supplied. But now he shares the market only equally with the foreigner, and may well consider whether it is wise to confine himself only to the production of food, and leave the more profitable supply of the raw material of some of our most extensive manufactures to foreigners. *J. C. H.*

NOTES OF FARM PRACTICE IN 1776.

FARM MANAGEMENT, &C.—As Mr. Leeder is a very sensible man, I ask him a hundred questions about different things. "Suppose you farmed a strong wettish land," says I to him, "what would you do with it?" "I would not sow many Turnips, but fallow for Wheat; nor would I plough so often as we do on light lands. I would not sow much Barley. The year I fallowed, I would plough as often as I could do it dry, but at all other times, only once for Oats, or Peas, or Wheat, after any crop." These are the sentiments of an excellent Norfolk farmer, with regard to strong land. "Do you expect, then, that I shall introduce frequent ploughings into a wet country?" He told me that many people think they can farm a soil to which they are strangers, as well as that to which they are accustomed, and that many people have ruined themselves by this very thing. He stated that although he had had experience of 4 or 5 different farms for many years, yet to this day he could not manage any of them to such purpose as the one that he was bred upon. "There are," said he, "nice times and touches (what we call tidds in Scotland), which I nor no man can explain to you, and which are only to be learned by long and attentive experience. Nor is it that kind of experience which some farmers have of being upon a farm twice or thrice a week, that will teach it, he must be upon the ground every day and every hour of the day to acquire it thoroughly. No wonder then that so few are masters of it. For this reason I would never choose to leave the farm I have been bred in, and I would never advise any farmer to change his situation, even though a good place was offered to him. For a number of years he cannot reap advantages which he might have done at home, and he is now to sustain a great loss by removing his stock."

March 4.—Having met with a man who told me of a great farmer in Suffolk, who had improved a deal of waste land, I resolved to see his farm, which lies about 30 miles from Yarmouth, on the east coast. I had no recommendation to Mr. Howlet, but introduced myself by telling him what my intentions were. It was near 12 o'clock, and he begged that I should dine with him and then take a walk through the farm. He told me when he took the farm there were only 800 acres of ploughed land in it, but he ploughs up every year 100 acres of heath, of which he has about 2000 acres. His rent is 800*l.*, tithe free. There is clay on the farm, which is the foundation of everything to him. Mr. Howlet never dungs to Turnips, but either to the Peas or Wheat as convenient; his reason for this is that his land is so light, that he would not have Wheat without it. Dunging to the Turnips is not of such importance to the ground, as he always feeds off the Turnips upon the land, which is as good as a coat of muck. He folds sheep upon his Wheat, too, which is done immediately after sowing, and it answers admirably; but he does not get above 4 or 5 coombs an acre, yet he thinks it worth sowing. Into the bottom of his yards he has laid more than 2000 loads of sand, to make proper foundation, more than for manure. He does not board his harvest people, but gives them five guineas and 10 pecks of malt for the season. Digging, filling, and spreading clay 15*s.* per 100 loads; he has let out some, carriage and all, which costs about 40*s.* per acre, though the pit is in the field. He showed me an iron plough which is thought to go lighter than the wooden ones. After seeing all Mr. Howlet's farm, which took us part of two days, and which I thought well worth my journey, I took my leave of him with a good deal of reluctance. As an instance of Mr. Howlet's assiduity, he says he has not been absent from his farm above four days since he took it, which is four years ago; he sees all his people and stock twice a day. He has correspondents in London to whom he sends all his grain and fat cattle, so that it is only to buy cattle that he goes out. He keeps 1400 breeding sheep, takes very good care of them, and I have heard that he pays his rent by the lambs almost every year.

March 6.—From Blythborough I walked to Halesworth. It occurred to me on the road that Mr. Leeder had a Suffolk farm hereabouts, and, after inquiring for it, with great difficulty I reached it just as it turned dark. The upper servant is a discreet sensible man, and gave me all the information he could. In this strong wet country they never make a broader ridge than 6 feet, which is called eight-furrow work. For Turnips, they plough five times, and choose to give the first furrow before winter. Few have good Turnips here, owing to their sowing them late, but Mr. Ewel has introduced sowing before Midsummer, and got very good Turnips.

March 7.—In the morning I went out with Mr. Ewel to see the stock taken care of. The first thing he does is to go and bring a load of Turnips for the cattle; these he strews on the driest part of a Grass field. The park was very much poached and cut up. I asked him if that did not destroy the Grass. "So far from that," says he, "that where it is most trodden it will be the sweetest." This was new doctrine to me, but he assured me it was undoubtedly the case; and, further, it prevented fogging in the pasture land. Everybody complains of the want of straw this winter, and Mr. Ewel says it makes the greatest odds in the bullocks' thriving ever he saw. Last year they kept the yard quite dry, and the cattle, after getting a bellyful of Turnip without, would come in and immediately lie down to lick themselves, but this year the yard is so dirty that the cattle do not lie down till they are tired of standing.

PRODUCE, RENTS, AND PROFITS. *Norfolk, July* 10.—The following is the valuation of the crop on a little farm at Plumstead, and may give a better idea of things than I can:

Wheat, 7 coombs per acre, at 17*s.*	£5	19 0
Deduct for harvesting Wheat crop	0	7 0
	£5	12 0
Barley, 8 coombs, at 9*s.* 6*d.*	£3	16 0
Deduct for harvesting Barley crop	0	4 0
	£3	12 0
Peas, 6 coombs, at 12*s.*	£3	12 0
Deduct for harvesting Pea crop	0	7 0
	£3	5 0

Harvesting is either done by the season or the piece. Day work is not known at that time, and very properly it is so. When the crop is about one-half Wheat and one-half Barley, they allow about 15 acres to a harvest man; where it is mostly Barley, 20 acres. Two men reap an acre a day, and one man cuts from 2 to 3 acres with the scythe. The following is the expense and profit of an acre farmed on the Norfolk rotation:

PRODUCE.

Turnips	£2	10	0
Barley, 7 coombs	3	10	0
Clover	2	10	0
Wheat, 6 coombs	6	0	0
	£14	10	0

EXPENSES.

Four ploughings to Turnips, with harrowings	£0	14	0
Twice hoeing	0	0	6
Three ploughings to Barley, with harrowing and rolling	0	10	6
Seed, three bushels	0	7	6
Reaping and carrying in	0	5	0
Clover seed	0	5	0
Making hay and carrying	0	5	0
One ploughing to Wheat	0	3	6
Seed, 3 bushels	0	15	0
Reaping and carrying	0	7	0
Rent for four years	4	0	0
Tithe and town charges	1	4	0
Dung bought besides the produce	2	10	0
Four years' expenses	£11	18	6
Four years' produce	£14	10	0
Four years' expenses	11	13	0
	£2	17	0

Allow 17*s.* for tear and wear, repairs, &c. This calculation is very moderate. The whole of the crops generally exceed what they are set at, and often the dung made by the Turnips and straw serves without buying. There is nothing charged for threshing and carrying out the corn, the straw and offal being an equivalent, and there are many valuable articles raised independent of the above, such as poultry, pigs, &c., but these are mostly allowed to the wife for pin-money; so the farmer does not reap the profit. This is a more profitable method than any fallowing course, as though the crops may be greater, yet the loss of one crop, and

paying the rent too, reduces the produce very much. Better to buy dung than to fallow. Mr. Leeder, at Plumstead, does not confine himself to the common course at all; he sows a good deal of Peas, and has a field of Coleseed. I dare say he has not a sixth part of his farm in Turnips. He tries several methods that other farmers do not think of. He ploughs the Wheat stubble before winter; when it is for Turnips, it is ploughed as deep as ever they can, because if they do not then get plenty of mould, they never will afterwards. For Barley, they plough as shallow as possible. There are bad ploughmen here as well as at home, and we saw a farm quite foul, and in bad condition, which Mr. Leeder says is just owing to bad ploughing, for they plough as often as other people. This man, last summer, letting a crop of Turnips run on too long without hoeing, paid near 20*s.* an acre for hoeing them, and after all his crop was not worth that money; whereas if he had hoed them in time, he would have had a good crop. This may show us the use of proper hoeing better than a hundred good crops. So I think we are obliged to the bad farmer as well as the good. Strong land keeps dung much better than very light. Mr. Leeder does not like very light land, Clover or Wheat does not grow very sure upon it. A good mixed soil, with a dry bottom, is better worth 20*s.* an acre than such as Mr. Rackham's at 7*s.* 6*d.*; but rather light land for tillage as strong clay lands. I suppose he would rather farm the ground west of Linlithgow-bridge than the carse of Falkirk. The planting of Wheat is an improvement introduced here within these three years, and, as is often the case, the old and the new, or the practical and the speculative part of the farmers, do not agree upon it. It is said that besides the saving of seed, which is a public benefit, the crop is greater, and you may plant Wheat where you cannot sow it. Add to this, that Wheat may be set on old lea, and I think there is no doubt of its being a great improvement. *N. B.*

Home Correspondence.

Prevalence of Ergot in Wheat.—I have received a sample of ergot from a field of red Wheat of 1849 with an assurance that this disease has been very prevalent in some of our stiff clay lands hereabouts. I was asked whether the Wheat, having been grown on land which had been pre-occupied by Rye-grass, among which also the ergot had shown itself the year before, was likely to have become ergotted in consequence. Not supposing this to have been the cause, I solicited further inquiry, and have received the following information: "Although the Wheat to which I called your attention was taken from a field which had previously borne Rye grass, yet my men say that more still was found among the Wheat threshed for seed, and which did not succeed Rye-grass, and was moreover grown on one of my best fields, underdrained. But that crop was laid." It may be worth noticing that our farmers here declare our heavy lands to have produced them only half crops during 1849, whilst in other localities we hear of the great abundance of the last harvest. I think I never observed the Wheat midges (three species out of four now known), more abundant than they were last year, and very probably their evil influence must have been considerable. There is a notice concerning the habits of the Wheat midge in the "Annals and Magazine of Natural History" for Feb. 1850, to which it would not be amiss that agriculturists should direct their attention. It contains an account of observations made on this pest in Nova Scotia, by a gentleman who has taken up the question where it was left in 1842, in the Journal of the Royal Agricultural Society, and solved a difficulty which had not been mastered on this side of the Atlantic. *J. S. Henslow, May* 28.

Practice with Science.—In the raising of manure, one of the first things to be attended to, either in a large concern or a small one, is, "Let nothing be wasted." How often do we see the reverse of this to be the case. The dung is either wasted by the cattle in the fields, or else is thrown carelessly together by the side or within reach of a pond, into which escapes all the essence which constitutes its main fertility. There are a variety of ways by which the mixen may be increased or enriched, which are entirely disregarded. It has already been said that no farm-yard should be without a tank. The reservoir communicating with this should contain all the refuse herbage or other matters that by fermentation would become decomposed, and by this means afford a large material for the formation of a compost heap. If there is bog soil within reach, and which can be laid down under 4*s.* a ton, nothing is more valuable than this for becoming a component part in any stercoraceous mixture. We have long heard, from high Scotch authority, of two-thirds of peat and one-third dung, being placed in layers and then mixed together, forming a most valuable heap for fertilising almost any sort of soil, particularly strong clays. But peat may be made serviceable in a variety of ways. It should not be used in its raw state, as it then contains much of the tannin principle, which is injurious to vegetation, and in its natural composition prevents the growth of any other plants except those of an aquatic kind. It should lie exposed to the weather for some length of time, during which the miasma would evaporate. It would then serve as a valuable layer for the bottom of the farm-yard or for the different sheds, and after having embodied the strength of the liquid elements that flow from different parts of the yard, it might be carted out for use. There is a good practical essay in the Royal Agricultural Society's Journal, vol. i. p. 135, by James Dixon, Esq., on making compost heaps from liquid manure and other substances. In this is shown the great advantage of using peat earth mixed with liquid manure. The latter is quite one of the most powerful fertilisers that can be applied to the land; and near the large manufacturing towns may be rendered a most valuable aid for raising all sorts of crops. The urine from animals in given weights is more powerful than their solid excrements, after these have been diluted by wet or wasted by evaporation. The strength of what is obtained in the manner mentioned much exceeds that which comes from the common farm-yard, be it ever so well preserved. When this manure can be procured at a cheap rate, the feeding of cattle almost becomes superfluous, and it may be a question, where the profit arising from it is, in a general way, so small, whether the best mode of enriching a farm is not from purchased manure. Guano is of a most forcing character. Some suppose that it is a mere stimulative, that promotes a rapid and luxuriant growth, with very exhausting powers. This, to a certain extent, may be very true. No one will suppose that a manure of an alkaline quality, that raises a crop double in quantity, will leave the ground in as good a state as after the common process. But surely the increased produce in this case will compensate for some deterioration. The best proof of its value is shown in its increased consumption. The price used to be only 7*l.* the ton, and it has now risen to 10*l.* and upwards. Its wonderful productive faculty may be shown in a case which occurred to myself. A tenant of mine had a crop of Turnips grown with bought horse-dung. The dung cost 18*l.*, the carting 6*l.* I had a crop grown with guano, 3 cwt., which, at 10*l.* the ton, would be 1*l.* 10*s.* There was very little difference betwixt the two—mine somewhat inferior. The soil of the two was precisely the same, being almost adjoining to each other. Here then is a saving of more than 20*l.* in a single acre of Turnips; yet some are disposed to say that these manures are too expensive, and Mr. Hillyard says (p. 118), speaking of desiccated night-soil, guano, and many other costly manures, which may be called artificial, that they may be very well for no-rent paying farmers to buy them, but it is quite out of the question for those who have to pay rent; and he adds, a good farm, well managed and properly stocked, will, like a good joint of meat, baste itself. That no farming of any extent can be properly carried on without a good supply of farm-yard dung, is most certain. From its being near at hand, and from its more substantial and permanent qualities, it is necessary to keep up the soil to its proper mark for a continuance, but these stimulating manures will often come, as a rate in aid, and be of the greatest service; and in some cases they can be used when the other cannot. A sprinkling of them is most beneficial for different crops, if applied in moist weather. They can be used either for white crops, on the surface, when in their early growth; or for Mangold Wurzel, Carrots, &c., after the plants have shown themselves above ground. Perhaps the best way of growing Turnips is to use half dung, half guano, which gives both strength and luxuriance to the crop, and does not exhaust the land so much as with guano alone. There is another manure most deserving of attention, which is, bones dissolved in sulphuric acid. This subject is treated of at length in the "New Husbandry," p. 265. It may suffice here to say, that Mr. Pusey considers that, from the trials made of it, good hopes are held out of the most important saving that was ever made in the use of manure; and the Duke of Richmond states, that he had tried one acre with it, another with guano, and a third with stable-yard dung. Early in November he had a quarter of each drawn and weighed, the heaviest crop was from the land manured with the sulphuric acid, though it did not cost him above 11*s.* or 11*s.* 6*d.* an acre. *Law. Rawstorne.*

Potato Planting in Ireland, 1850.—I have delayed sending the accompanying answer to your inquiry till I could do so with as much accuracy as my judgment permitted. The general hyperbolical expression is, "that more Potatoes are planted than ever;" this is strictly true, if the "ever" is limited to the last four years, but there are many causes to prevent their being planted to the extent to which they were previous to the epidemic; the conacre, which before covered half the Potato land, does not exist; a large part of our population which before existed solely on the Potato is now fed from the poor-house on other articles of diet; labour is now necessarily paid for in money, for the labourer has not his summer store of Potatoes to subsist on while the new crop was growing; large tracts of land are thrown out of tillage, and are on the landlord's hands; as manure was only of value in connection with the Potato, less care has been taken in accumulating it; as seed is not now in the hands of the people, for any extensive culture it must be purchased, and few can afford to do this to any considerable amount; many, too, are forcing crops of grain, as being more readily disposable, with a view to cut and run after harvest, with what they can carry off from their landlords, for the tide of emigration is still fast and furious. Yet as many of the same causes which militate against a very large tillage of Potatoes will also limit their consumption, the quantity now likely to be produced will probably be as equal to the demand as it was in the years of our widest tillage of them. The probability is then that we shall have them very cheap next year, and from the facility this will well afford for seeding the land, and from increased confidence in the crop, I think we may reckon upon a largely increased tillage of them. They have this year nearly superseded Turnips, for which I see very little preparation. The confidence in the Potato is revived, and as a food to a people who cannot use animal food, it is invaluable; we cannot therefore be surprised at the avidity all show for its production. It is indeed a bread fruit, for which oatmeal and Turnips afford a very meagre substitute. Its restoration is the first step to our recovery, we have from want of energy lost any advantage we might have obtained from its failure, and our only resource is to fall back as soon as possible to our old system.—Compared with 1849 four times more are being planted. Compared with the years before the Potato rot, about one-third in Longford—more, perhaps one-half, in Cavan. There is scarcely any revival of the conacre system, the only instances I am aware of are some very few instances of land so given or let out for manure convenient to towns. The present price of Potatoes for seed, per cwt., is 4*s. J. M. Goodiff, Granard, Longford.*——It is difficult to arrive at any just estimate of proportions, but I think the quantity planted in this district must be at least double that of 1849. It seems to be the general opinion that there is not yet more than from a fourth to a third of the full quantity that used to be planted before the Potato disease. The conacre system, happily for this district, never had place among us. In February and March choice early varieties, such as Cruffles and Forty-folds, chiefly the former, sold at 6*s.* per 112 lbs. for seed. The price afterwards declined, and common varieties have lately sold at 4*s.* down to 3*s.*, for small. *John Andrews, Comber, Down.*

The Economy of Manure is deservedly engaging the attention of farmers at the present time. It may be inferred from a late interesting lecture by Professor Way that a clay soil is an efficient retainer of ammonia, and when it is generated by the decomposition of manures buried in the soil, it is absorbed and held there until required as food for the next crop, and that sandy and calcareous soils possess this property in a much lower degree. These facts, which have been proved by careful investigation, appear to coincide with the experience that heavy soils do not require applications of manure so frequently as those of a light and porous nature, and that a naked fallow is highly beneficial to the following crop on a strong clay; whereas the light soils lose by long exposure a great part of the soluble matter they contain. It follows then that manures, either in a solid or liquid form, may safely be applied to land containing a fair proportion of clay, a considerable time before the sowing of the crop. As most soils possess the power of retaining the valuable portions of manure as they are evolved by decomposition, which discovery exhibits a beautiful provision in nature, how does it happen that we do not apply it to the land before it has sustained the great loss which often occurs during fermentation in the heap, and drainage during the process? And with regard to liquid manure, if applied in the recent state, though its operation may not be so immediate, I do not see why it should not be as effectual, unless the nitrogenous substances from which the ammonia is produced are more liable to suffer loss after being mixed with the soil than ammonia itself, being formed previously by fermentation; or it may be that a more favourable combination of particles is induced by such fermentation than by the slow decomposition which takes place in the soil. Perhaps some of your readers will be kind enough to explain the difference in the effects of these two kinds of decomposition, and also of their experience in the application of artificial modes of fixing ammonia. It is not always convenient, even if it should be proved desirable, to apply manure immediately it is produced, and perhaps there is no better way of preserving it than by throwing it up into a compact heap, rounded at the top, and covered with soil 1 or 2 inches in thickness, preserving the drainage by channels leading to a cask sunk in the ground. By this method, the loss, though not entirely avoided, would perhaps be less than the expense of obtaining other means. *T. W., West-hill, Wandsworth.*

The Qualification of Farmers.—A correspondent in a late *Gazette* draws a comparison between the qualifications of gardeners and those of farmers, and considers that it is as important for the farmer as the gardener to give a public unequivocal proof of his fitness for his profession. The cases are quite dissimilar—the gardener is the servant of another, and the farmer is his own. The want of qualification in the gardener affects the master primarily and seriously, and if a party could obtain a diploma of efficiency in his gardener, it would be a great convenience. The gardener works with his master's capital; the farmer is his own master and trades on his own capital. A man may pass an admirable examination in the natural sciences, and also in practical agriculture, and yet be unsuccessful as a farmer. Marketing judiciously is equally important with rational and enlightened cultivation, and no evidence of this qualification could be given. It would be perfectly futile to attempt to induce the present generation of farmers to pass an examination. What would be the good of it? whom would it benefit? The mere circumstance of passing the test would not enable the farmer to make 1*l.* a year more, and those that were rejected and denied the diploma would go on farming as before, and perhaps show a better balance at the end of the year than the highest graduate in agricultural science. The idea of giving evidence of qualification is worthy of consideration, but only as regards the young. Let the farmer see the importance

of having his son properly trained and instructed before he allows him to enter on the detail of every-day farm life. The usual system of education pursued by farmers' sons is quite inadequate to the important functions that they are called on to perform. A boy is sent to school until he is 14 or 15 years of age, and devotes his whole time to routine studies, which are equally suitable for him as a draper, a grocer, or a farmer. Many of the youths leave school before they can write a piece of English correctly, from dictation, much less express their thoughts in passable English. There are, we are happy to say, some institutions recently established where a most excellent and suitable course of education for agriculturists is pursued. But they all labour under the same difficulty—the pupils are too ignorant when they are admitted, and remain too short a time under instruction. As soon as, or even before, the several masters have laid a broad and deep foundation in the elements of physics, botany, geology, chemistry, zoology, accounts, and mathematics, the youths are taken home or sent out to a farmer for the period of two or three years. It is here that the error lies. These lads are not expected to work as labourers, they are not fond of reading, and they are glad to pass away the time in talking to the men, hunting rats, or in other pursuits that are equally improving. How is this to be remedied? I apprehend in a very simple manner. Let the agricultural college at Cirencester extend its encouragement to all those schools that are following in its wake. Let it publish a series of good manuals (similar to the one that its late professor of chemistry Dr. Blyth did on his own department), let it found a few scholarships, to be obtained by competition, and it will thus raise a standard to which the elementary schoolmaster may work. The Royal Agricultural Society have done much for agriculture, but they are guilty of a serious omission. They have not, as a body, given encouragement to agricultural education. It would be an easy matter for the society to establish a few scholarships of 50*l.* a year, each to be held for three years. These exhibitions might be enjoyed at Cirencester, and at others of the schools who chose to put themselves under the inspection of the society, and give a guarantee for carrying out its objects. The Royal Agricultural Society might give a prize annually for the best essay on the education of the farmer. In the course of a few years those young men who receive a suitable education will be the best persuasive for the farmer to educate his son. There is a great lack of suitable books for agricultural pupils—in some departments we have useful manuals. I may mention that most valuable book of Dr. Lindley's called "School Botany"—perhaps a sequel to it, containing the cultivated plants and the most troublesome weeds, might be given to the world under the auspices of some of these powerful institutions. This subject may be worthy of the consideration of your numerous and enlightened contributors and readers. *D. W.*

Parish Roads.—Having long desired to see trust and parish roads amalgamated, and both maintained by a road tax on horses, I was very glad to see the *Gazette* take up the advocacy of such a measure. Your Paper being read by men at once most fond of considering how earth-works can be best performed, and whose interests are most deeply concerned, may be made an excellent committee room for considering suggestions on the subject. I apprehend the partial existence of trust roads to be a great difficulty, as hindering the adoption of a general system. Seeking some equitable arrangement, my idea has been somewhat this—that there should be (1) a uniform rate on horses over the country for the repair of the roads, and for the eventual extinction of the trust debts. Thus I tax the country at large, for their share of benefit conferred by local trust roads. 2. An additional local rate on the horses of each parish, union, or hundred, but collected with the other, to pay the present net annual interest of the trusts in such parish, union, or hundred. I should prefer a general rate for the kingdom to one for each county; but, whichever were chosen, I should have large districts let by tender on long terms to parties, who if they pleased would sublet in smaller portions. *E. M.*

Game.—You have not been deficient in pointing out to farmers and others the necessity of saving every atom of manure, and the best manner, I believe, of making the most of what they already possess. That farming at the present day must be very different to what it was 50 years ago, is generally admitted. It will perhaps not be out of order at the present time, to get you to raise your pen for the benefit of the farmer, in the destruction—the entire destruction of game—that spoils his crops. "Fair play (it is said) is a jewel," why is the agriculturist to be denied it? It is well known within the last 10 years game has been preserved to a ruinous extent. Within the last 2 or 3 years, some admirable examples have been in existence of the routing of it all, only I regret as yet partially accomplished. If one time or period is more pressing than another, now is the time; why hesitate to banish these costly pests? That the landowner and the poor cottager would be greatly benefited by it, is not a question; and as far as a day's recreation of shooting is concerned, surely a man may as well, if not better, walk 10 or 20 miles in the pursuit of it, than if he only went 5. No doubt that sense of duty which prompts the scientific, or the practical man, not to hesitate in announcing the way to the high road of improvement, will also guide him to preserve that produce from destruction. *A Man in Daily Practice.*

Farmers' Income Tax.—There can be but one opinion upon some portions at least of the petition presented by Lord Stanley on Monday last on behalf of the agriculturists of the Isle of Thanet. The petitioners complained that they were assessed for the income tax upon an assumed rate of profit, greatly exaggerated in the best of terms, but now out of all character. The justice of this complaint is apparent to everyone, and upon what principle the Government assumed half of the rent to be the farmers' profit, we are utterly at a loss to make out. It would have been equally just if ten times or any other number of times this rent had been assumed to be the profit of the grocer or linendraper. There was a time when the agricultural body were the pet children of Government; each endeavour to interfere with their vested interests ending in the certain downfall of the minister who ventured to propose a change in existing arrangements. But times are changed, and now they certainly have not a fair share of attention. Why should not farmers enjoy the same privilege as the merchant or manufacturer? The latter makes a return of his profits. Upon what principle of justice is the farmer to be prevented from doing the same? It is worth while enquiring why the agriculturists, as a body, do not now meet with the same attention as the other portions of the community. Are they less deserving now than formerly? Is it not rather that, like the cartman, who shouted to Jupiter for help to get his cart out of the mud, instead of putting his own shoulder to the wheel, they are too prone to look to others for the help already within their own reach. Men of every shade of opinion must admit the hardship of paying an income tax when the year's transactions have ended in a loss instead of a profit. On this point the farmers have an acknowledged ground of complaint. Let them therefore petition for its removal, confining themselves to this point, on which they are sure of sympathy, and not like the petitioners represented by Lord Stanley, branching off into debateable ground. Let every agricultural journal lend its aid, and that justice which is not denied to every other branch of industry, cannot, will not, be denied to agriculture. We are not seeking the removal of a tax, as is now so much the fashion. All we desire is to be allowed, in common with every other trade and profession, the privilege of paying the income tax upon our actual income, and not upon an arbitrary and unjustly assumed scale of profits. *T. L. C.*

A Word more respecting Roads.—The present system of maintaining the highways by means of toll-bars is admitted by every one to be objectionable. It interferes with the necessary intercourse between districts, checks improvements in building or draining, is a fertile source of litigation and quarrels, and, as has been already remarked in your columns, it is the clumsiest tax that is levied, as not one-half of the money paid is actually applied to the roads, the other moiety being swallowed up by "pikemen," clerks, surveyors, and interest of debt. It is said that there are about 6000 turnpike gates in the kingdom, and that the cost of collection alone amounts to nearly 1,000,000*l.* per annum. The great opponents to any change will be these "pikemen," the clerks, and the lessees. The trusts are mostly composed of the landowners adjoining the line of road; and as few of them are men of business, or what is worse, still fewer of them bestow any attention to the subject, it is in vain, therefore, to look for any improvement from them, if, indeed, the system be capable of any; but our opinion is, that however well it might be adapted to the wants of the community 150 or 200 years ago, the present system of management by turnpike trusts is a disgrace to the legislature, and a burden upon the public that cannot, will not, be much longer tolerated. The apathy of turnpike trusts, and the landed gentry, on this important subject, seems something like infatuation. It concerns them much more than the people of the towns, and unless they stir in it, they must continue to bear the consequences of their own indolence. You have already stated objections against the proposed alteration in our township and parish roads. It leaves the great evil altogether untouched, and I never hope to see the management of them taken out of the hands of the rate-payers. Local management, though sometimes defective, is of the highest value, in cultivating a knowledge of affairs, and preserving constitutional freedom. Let turnpike trusts, toll-gates, and all their abominations be swept away, and let local taxation be organised on better models. The consequence of the proposed measure will be a host of Government officials to manage what they are quite capable of managing for themselves—increased expense—and, to crown all, the perpetuation of the toll-gates for another generation. To bearing all this John Bull seems to be quietly settling his broad shoulders, and yet we are satisfied, if one single petition on the question were presented, the measure would be abandoned—a step we would ten times over prefer to the proposed alteration. *T. L. C.*

Poultry Management.—I have always considered the rearing and management of poultry a matter of much more importance to the farmer than he is generally willing to believe. My poultry are of the same sort as may be found in any of the neighbouring farm-yards; the eggs of the largest and best hens have been selected for sitting, so that the stock consists of birds capable of covering 15 eggs, which is the largest number I ever place under a hen. The cocks are changed every two years, taking care to supply their place with fine healthy birds of the previous year. Hens are useless after the third year; my plan is, in a stock of say 30 hens, to introduce 10 young pullets every year, and part with 10 of the oldest hens. One male bird must be kept to every seven hens; but when more than 50 hens are kept, one to every six is necessary. On the proportion of male birds kept depends, I am confident, the number as well as the successful fecundation of the eggs. About a month since, as an experiment, I placed 13 eggs, which I had procured from a farm-yard where the proportion of male to female birds is about 1 to 15, under a hen, and mark the result. From 13 eggs were produced three chickens; seven of the eggs, at the end of the three weeks, were almost as fresh as when just laid, and three were addled. My chickens are fed twice a day, in the morning about half-past 7 (later of course in winter), and at 2 in the afternoon. Their food consists, during the five summer months, of dry Barley, and from October till April of boiled Barley given warm, and 20 oz. per day each of tallow cake or chandlers' greaves (the same as used by Mr. Huxtable for his pigs); the cost of this latter is a fraction under a penny per lb., and is I think the best and cheapest substitute for the animal food they are unable to procure in the form of flies and insects, at that season. I have found by experiment that fowls will lay more regularly on Barley than on any other grain. Hens during the period of incubation should be fed on dry Barley, as the greater the heat maintained in the body of the hen the finer and more numerous will be the progeny. Never turn the eggs, as some do; the hen will do this herself. Leave the chicks till nestled, *i. e.*, till the down becomes dry; feed them with soaked bread for the first two days, returning them as soon as fed to the mother, after which they may be kept on tail Wheat (and curds, if you have the milk), until they are seven or eight weeks old, when, and not till when, they may be fed on Barley and Barley-meal, mixed with bran or pollard. I have this year only 18 hens and three cocks, the foxes having stolen rather more than one-third of my stock during the winter; these 21 fowls consume a sack of Barley, which costs now 11*s.*, in 31 days, and have laid on an average 16 eggs per day since the 1st of March. I find the expenditure for corn, tallow cake, &c., for the old stock (not for the chickens produced by them) pretty nearly balanced by the receipts from the eggs one time with another. The following is the account, Dr. and Cr., of a stock of eight hens and one cock kept by myself, in an enclosed yard, during the year 1849.

DEBTOR.	£	*s.*	*d.*
Eggs sold—number unknown, but furnished all food consumed by the nine fowls mentioned	0	0	0
Chickens reared.—33 couple sold at 3*s.* 3*d.*	5	7	3
13½ couple reserved for stock for present year at 3*s.*	2	0	6
3½ couple of ducks at 2*s.* 9*d.* ...	0	9	7½
	£7	17	4½

CREDITOR.	£	*s.*	*d.*	£	*s.*	*d.*
1 sack of barley consumed by young chickens	£0	15	6			
1 strike of barley for do., and grinding ...	0	4	4			
1 cwt. bran	0	5	0			
6 pecks tail Wheat	0	6	0			
Marketing expenses	0	6	1	1	16	11
				£6	0	5½

6*l.* 0*s.* 5½*d.*, divided by 8, the number of hens, gives a net profit of rather more than 15*s.* for each hen. *The Son of a Country Rector.*

Allotments.—In answer to "R. G.," in respect to allotments, I reply that I have for 10 years let out land with good effect to myself and my tenants—a quarter of an acre to each tenant, and where there is an active wife and family half an acre—at 4*d.* a pole or 2*l.* 13*s.* 4*d.* an acre, free of all taxes and rates. The land is of two qualities, good rubbly or stone brash and sandy clay, which is far preferable for the cottager, as it retains the manure much longer, and with spade cultivation will improve yearly. This system works well for the poor and the rich—gives a great deal of employment to the tenant's family, or relations, the very young or the very old who would otherwise get no work. It breeds up a family to cheerful labour, for all work gladly for their own interests. It gives them plenty of vegetables, enables them to keep a pig, and so encourages cookery, and the purchase of one of the cheap and useful grates, and thus introduces skill and comfort into families. As this system gives a great deal of employment, and at a time of year when labour is not greatly wanted, it must lower the rates, and so be good to the rich. *Anon.*

Foreign Correspondence.

STETTIN, *May* 16.—The road to Stettin (from Berlin) affords good exercise for the imagination. Nobody could or would believe that one of the finest capitals of Europe lay behind him, and one of its chief corn-ports before him. The country is a blank: a hopeless blow-away desert of sand. 'Where *does* the corn come from?' you now and then ask yourself, as you look from one side to another, whilst the pertinacious map still keeps the word of promise to the eye, in the meandering course of the Oder, down whose left bank you are travelling, though you never get a sight of it. ——Yes; here is Berlin, and there is Stettin, and there is the Oder, as plain as map and print can make them: but—Where in the world am I? you ask, as you look incredulously around you. A compound of Siberia and Sahara is the only description that can be given of it. For miles and miles—German miles too—not a blade of Grass is visible; the chief variation in the landscape consisting of here and there a ridge of drifted sand, with a long-legged stork majestically perched upon it, like a surveyor-general. Slowly and thoughtfully he opens about four yards of wing as you approach, doubles his long red shanks under him, as if he were packing up a fishing-rod, and laboriously wafts himself off to the next ridge, lets them drop again, and watches you off like a sentinel.——At last a few Pines, barely rooted in the white sand, and struggling for a hungry existence upon earth, begin to show themselves; they

thicken gradually, and take courage as they thicken. The eye grows comforted as the dark green mantle rises slowly, shuts out the bleak horizon, and—you are in a Pine-forest !——Of all the sights of Germany, I know none more deeply characteristic, more truly and irresistibly poetical than the forest of Pine. Darker and darker, on it goes with you mile after mile, suggestive of everything that gloom, and depth, and silence, and countless, endless, giant stems hemming you round in grim shadow—*could* suggest to Fear or Fancy. The dead threatening silence, made more striking by the murmur now and then in the branches far aloft, the snagged trunks repeating each other in stern sameness far as ever the eye can reach, probe which way you will, the narrow road threading away before and behind you, like a tunnel through the darkness that frowns over it, and shuts out its 'Whence' and 'Whither,' as if both were hopeless and impossible for evermore; all this comes over you with a power, and impressiveness, and undefined feeling of painful vastness, and mystery, and awe —like a dream. Howling wolves and growling bears, and prowling huntsmen, with their heads off—anything that darkness and distance, and gloom encompassed solitude could bring forth, seems likely and imminent every instant; anything to break the heavy silence that threatens you from every winding, and from behind every tree. At last the obscurity begins to break, the trunks divide, and dwarf; a few white Birch-stems disturb the uniformity of the wood—like cracks letting in sunshine; a Grassy patch appears; you enter it and see the sky again; the spell is off, and you emerge presently upon some 'blasted heath,' where the very Pine-roots can hold their own no longer: you look back, and the long dark outline of the forest stretches away to right and left, behind you, across hill, plain, and valley—like the great black eagle of Prussia, spreading its wings over the land — symbolically enough.——But there were many places, as I approached nearer to Stettin, where nothing but the hand of Industry was wanting—or rather of Enterprise, which king-led Prussia wants more than Industry —to make them fertile enough. Green rank morasses, with ridges across and around them, which only want shovelling into them: stagnant water, with sloping ground near it, that asked but one well-laid master-drain to turn the bog into a meadow; patches of thin wiry-looking Rye, half-perished, that a few thousand Southdowns or new Leicesters would soon tread into 'four course husbandry.' Then came regiments of disbanded-looking geese and goslings, like strolling companies of players, with an open world for a stage, and all to themselves. I understand these gentry are now killed, *dried*, and packed, at a pretty handsome average annually, for the English market. How they must 'hate Peel,' and cackle curses on the 'arch traitor!' ——Then some more storks, standing in the Rye-fields without sign of life or motion; listening for frogs: *which* "when found make a note of," they are quick at not forgetting. Let one *irresistible* unhappy croak escape —and down comes the great yellow beak like a crowbar, in the twinkle of an eye, and up goes froggy, writhing and struggling at the end of it, higher and higher, till he gets to the family-supper at the barn-top, in a nest as big as a washing-tub, amidst a clattering and fluttering of Mrs. Stork and the young Storks, that would make an English farmer think his barn was in possession by the foul fiend himself. But the stork has free quarters all the world over; and here in Pomerania, he and his great nest are as welcome and essential to the barn-top as the cricket to the kitchen fire-place, or Parsley to the garden. His nest is enormous, and has the most lumbering ridiculous appearance on the gable of the barns, which you seldom see unoccupied.——The shipping at Stettin makes a very respectable appearance, as you come in sight of it. The Oder is navigable up to Breslau, for craft of one sort or another; but only on condition that it is neither winter nor summer: ice at one time, and impassable neglected shallows at the other, being its Scylla and Charybdis, which can only be steered *between* in spring and autumn; so these are busy times. Cargoes of Wheat are frequently detained *a twelvemonth* on the passage down! A railway would bring it in a day: but though there is one as far as Posen, it is considered too expensive for grain carriage: which is the more remarkable, as passenger-fares are very moderate—little more than half what they are in England. 'Sandars on Prices' is still the staple of conversation at Stettin, and has generated some very sore feeling in the place. Every daily paper has got 'a letter,' or 'an answer,' or 'a rejoinder,' still lingering out the subject. As far as I gather the truth of the matter, it seems to have consisted in an individually correct assertion, leading by its generality to an erroneous impression. Every merchant, in admitting the possibility of the bargain named to the House, laughs at the conclusion aimed at by the Speaker. The idea of extreme cheapness seems to be regarded as a sort of reflection on the mercantile capital of the 'holders,' who are apparently long-winded enough, and as little fond of low prices as we are. In reply to a remark on the recent rise in the English markets, the answer I received was, "Oh! you will see we are ahead of you: for every shilling you go up, we shall go a thaler!" (three shillings.) This is not unlikely for awhile, if the explanation that was added be true; namely that France has over exported, and will feel it doubly from the probable late harvest of this year. Certainly she seems to have been a pernicious meddler in the corn market; as must always be the case when a buyer suddenly becomes a needy seller. In Brussels it was said three weeks ago, that flour had not been so cheap in Paris *for* 40 *years*. But all this seems to be fast changing at home and abroad; and if it be true that a late harvest is seldom a good one, the price must change a good deal more yet. The weather is more like March than May. The winters must be much severer here than I imagined, judging from the signs which have met my eyes and ears, in going over a couple of farms yesterday, in the neighbourhood; on which I hope to send you a future line. *C. W. H.*

Farmers' Clubs.

LONDON, *April* 1: *The Principles which should regulate the Valuation between the Landlord and the incoming and out-going Tenant, under an equitable System of Tenant-right.* Mr. SHAW said:

I understand tenant-right to be "the right of the tenant to require compensation legally for outlay in the improvement of the soil or buildings, when the period of his occupation has not been of sufficient duration to enable him to reimburse himself that outlay." It is essentially necessary to observe the distinction between the subject matter of "tenant-right" and "tenants' rights," inasmuch as the confounding the two together exposes the former to the well-merited obloquy which in most cases attaches to the latter. An especial instance of this will be found in the evidence of a gentleman given before the Agricultural Customs Committee, in reference to the tenants' rights of the county of Surrey, which he severely and properly condemned, and which induced many persons who did not distinguish between the two systems, to condemn tenant-right. Another instance has just occurred, in which the *Times* Commissioner, in a letter which appeared in that journal on Friday last, confounds the Surrey system with "compensation for unexhausted improvements," or tenant-right. The tenants' rights in Surrey, which form the subject of valuation, consist of labour, rent and taxes, produce, as hay and straw, and, with the exception of lime, the manurings which would be applied in the ordinary course of husbandry annually, and without which crops cannot be produced. The subject matter of tenant-right, in respect to which we contend the tenant is entitled to compensation, consists of extraordinary outlay in draining, liming, marling, chalking, boning, the use of artificial manures, erection of buildings, &c., the legitimate return for which can only be obtained by a succession of crops and a lengthened occupation. The question of tenant-right was very fully discussed at the meeting of this Club (10th of December, 1845), and the following resolution was passed: "That, in the opinion of this meeting, a system of tenant-right would promote the interest of both landlord and tenant, and most materially conduce to the advancement of practical agriculture." The proceedings at that meeting attracted very general attention throughout the country, and a feeling was engendered amongst landlords that the "right" which the tenant sought to obtain, although it was nothing more than a fair and proper security for the investment of his capital, involved "wrong" to the owners of the soil. In order, therefore, to prove that such an opinion was without foundation, and to disabuse the minds of those who harboured such a notion, a special meeting of all the members of the Club was held on the 11th January, 1847, when the subject was again discussed in another form, the question proposed being, "How far would a well-regulated system of tenant-right be beneficial to the landlord?" The chairmen and secretaries of all the local farmers' clubs and of the protection societies were invited to attend the meeting, which was numerous. Upon that occasion the duty of opening the discussion devolved upon me. The debate was long and interesting, and terminated in a resolution, "That a well-regulated system of tenant-right would be beneficial to the landlords of this country." It is, I think, to that most important branch of the question that we should direct our special attention. We cannot too much impress it on the minds of landlords, nor adduce too many proofs to convince them that they cannot be injured by tenant-right. I will here venture to read to you a certain number of reasons which I enumerated on the occasion last alluded to, for the purpose of showing that tenant-right would not prejudice the interests of landlords. "1st. That the nearer the nature of the tenure or occupation approaches to definite ownership, the more valuable the holding to the occupier. This is especially shown in land let for building, upon which large sums were expended in consideration of the security afforded by the duration of the term. 2d. That the undisturbed possession of a farm for the term of (say 20) years, affording opportunity to the tenant to carry out his system of improved cultivation, will enable him to give a higher rent with advantage to himself. 3d. That a system of tenant-right, giving compensation for unexhausted improvements in the event of eviction, affords the tenant the next best security to a lease. 4th. That there are many tenant farmers who, if they possessed security of tenure by lease with proper covenants, or an agreement securing compensation for exhausted improvements, would give a higher rent for land capable of improvement, if so secured, than they would on a tenancy from year to year. 5th. That security of tenure would enable the tenant to increase his capital by loan. 6th. That such terms being granted, many improvements would be effected, which, at the termination of a lease or occupation where a system of tenant-right was adopted, would increase the value of the estate to the landlord. 7th. That as well where leases are granted as where tenant-right exists, rents are higher than when the tenancy is only from year to year. 8th. That the only sacrifice on the part of the landlord in granting a lease, is the placing his property out of his control for a term of years; but which he is amply compensated for by the absence of change of tenant, which sometimes occasions loss of rent, and always occasions expense. 9th. That this annoyance, if such it can be called, is avoided by tenant-right. 10th. That many expenses which in tenancy of year to year fall on the landlord, would in such case be borne by the tenant." These are the propositions which I submitted to the Club as reasons which ought to induce landlords to adopt the principle of tenant-right. So strongly did that meeting feel the importance of the subject that a committee was appointed to carry out the object. The result of these proceedings, coupled with a communication made to the several local farmers' clubs, led to still more general attention being given to the subject, and the bringing a bill into the House of Commons by Mr. Pusey, in the session of 1847, for the purpose of establishing tenant-right by law. The bill was read a second time, and referred to a select committee, by which it was so materially altered and damaged that Mr. Pusey deemed it most prudent to withdraw it, there being little hope of its passing. In December, 1847, the question was incidentally discussed in another shape, the subject proposed for discussion being the "Practical Impediments to the Development of British Husbandry." Finding that very many persons still entertained mistaken views on the object and meaning of tenant-right, in December 1848 I submitted the following question to the Club for discussion, "On the pernicious consequences resulting from the payment by the incoming to the outgoing tenant for tillages and manure made on the farm, according to the custom in some districts, and commonly called tenants' rights," the object being to correct the misapprehension resulting from confounding the one system with the other. That discussion ended in a resolution to the effect "That there are certain customary payments by the incoming to the outgoing tenants, in some districts, which are pernicious in their operation." Mr. Pusey again introduced a bill of an altered, but I can scarcely say of an improved character, in the session of 1848, and thereupon a select committee of the House of Commons was appointed "to inquire into the agricultural customs of England and Wales in respect to tenant-right." Whereupon a sub-committee was appointed by the managing committee of this Club to render any aid which might be required in procuring the best informed and most experienced parties to be examined before the committee. Fifty able and intelligent practical men, farmers and land-valuers, extensively engaged in their pursuits in almost as many counties, were examined before the committee, and furnished a most valuable body of evidence, which has been arranged as a digest under several heads, easy for reference and printed in a readable form. Upon the favourable report of the Agricultural Customs Committee, Mr. Pusey introduced a bill in 1849 (which was merely to enable landed proprietors and others, not at present possessing the power, to grant agreements giving compensation for unexhausted improvements to their tenants which should bind their successors); it passed the House of Commons, by was rejected by the Lords. Nothing daunted, Mr. Pusey has again brought in a bill this session; and although, if passed into a law, it would only enable landlords, who do not possess the power, to grant such agreements to their tenants, and hence would be very limited in its operation, still as its passing would be a recognition of the principle of "compensation for unexhausted improvements," and consequently of the justice of giving security to the capital of the tenant farmer, it merits support and approval. The effect of this discussion and agitation of the question for now nearly five years is, that landlords and tenants, understanding the principle better, have become alive to its importance as affecting the progress of agricultural improvement. The results of the adoption of the system in Lincolnshire have been adduced as a successful illustration of the benefits to be derived from affording compensation for unexhausted improvements; and such an impression has been made upon the minds of landed proprietors and managers of landed estates, that the system has been introduced in many cases in other parts of the country, and doubtless will be extensively adopted. A new difficulty has, however, recently presented itself, and which I have reason to fear is operating seriously with landlords, in disinclining them to enter into covenants granting compensation for unexhausted improvements to their tenants, and which arises from an apprehension that in case of dispute and a reference to arbitration, the question to be decided might ultimately rest with an umpire, who having the sole power vested in him, might have more regard for the interests of the tenant than of the landlord, and hence unfair advantage might be obtained by the former, and serious loss and inconvenience might be incurred by the latter. It is for the purpose of removing this impression, of obtaining and recording the opinions of the members of this club as to the best means of remedying the evil, if it really exist, that I have brought forward the question for discussion this evening. I may first observe that, irrespective of the influence of principles of honour and integrity, as a general rule I think that valuers, usually employed as arbitrators and umpires in such cases, are as much interested in maintaining the good opinion of the landowners as they are of the tenantry, which alone must have a great effect in preventing them from doing injustice. That solitary instances may occur of improper exercise of the powers with which an arbitrator or umpire is invested, is no sound ground for condemning the system. The severest laws are insufficient to prevent breaches of trust; the per-centage of such cases is happily, however, but small. The wisest plan is to adopt the best possible precautions, and such course I should venture to recommend in respect to the question under consideration. I should lay it down as a primary rule, that the general improvement of the farm belongs to the landlord; that compensation to the tenant for unexhausted improvements should never be measured by a reference to the rental paid as compared with the value of the farm to let when the tenant is quitting. Various circumstances may occur to improve the value of an estate, irrespective of the outlay of the tenant; and even of that outlay the landlord may be entitled to enjoy a portion of the termination of a long occupation. Compensation should be made to the tenant upon particular improvements only, the expense of which, as well as the period when executed, he should be called upon to prove by documentary evidence when practicable. That is comformable, I think, with what was stated before the Agricultural Customs Committee, by gentlemen from Lincolnshire, who had themselves practised as valuers in that county. Indeed, it already amounts to something like a custom in that part of the country. A man may take a farm at the rent of 10*s*. per acre, and at the expiration of a lease of 21 years the land may be improved by his outlay and capital so as to be worth 25*s*. per acre, and yet he may not in my opinion be entitled to any compensation for unexhausted improvements. I will say a word or two here on the question of what are improvements, and in respect of what improvements the tenant is entitled to compensation. I consider that an estate may alter and improve in value from a great variety of causes, in the benefits of which, I conceive, the tenant will have no right to participate, beyond what he can obtain from the use of the farm during the period of his occupation. I hold that in all cases, whether with or without tenant-right, the general conduct of the farm should come under the ordinary rule of what is called "good husbandry." What I understand by the proposition, that the tenant should be entitled to receive compensation for unexhausted improvements, is, that when he steps beyond what is ordinarily good husbandry, and gets to extraordinary husbandry, making an outlay which requires a longer period to obtain a return than that for which he has agreed, or he is evicted before he has occupied sufficiently long to reimburse himself, he should be entitled to compensation; but I contend that any increase of value which may have arisen in the ordinary course of husbandry belongs to the landlord, and that —to put an extreme case—if at the termination of a 21 years' occupation the land have improved, by ordinarily good management, from 10*s*. to 25*s*. per acre, the tenant is not entitled to bring it down again from 25*s*. to 10*s*., and to say, "I leave it as good as I found it." That is the distinction which I am desirous of drawing in reference to the right of the tenant to compensation. It is well known that draining, liming, marling, and chalking, improvements of a more durable character, will repay the outlay in a certain number of years, according to soil and circumstances. If these operations have been performed sufficiently early in the lease for the period held sufficient in that district to enable the tenant to recover his outlay, he would not be entitled to compensation; but if otherwise, he would have a right to claim for a proportion of the unexpired time. The same principle will of course apply to expenditure in artificial manure, cake, &c., &c. The evidence given before the Agricultural Customs Committee exhibits an extraordinary difference in the length of time deemed sufficient to enable the tenant to reimburse his outlay in the several operations which constitute the improvements in respect to which he may be entitled to compensation. Some of the witnesses speak of seven years, others of twelve. I observe that, as to Sussex, Mr. Smith, speaking of the draining of Hop land—whether there is any peculiarity in that case I do not know—says that, in his opinion, the return should be spread over 16 years. I find also, with respect to chalking, liming, and other operations of a similar description, the same disparity. Hence I have come to this conclusion, that as in all cases it is desirable to guard against evil rather than to remedy it when it has arisen, in any agreement securing to a tenant compensation it should be specified precisely what allowances are to be made: inasmuch as, from some cause or other,

whether it be variety in the prices of different localities, or from any other cause, the allowances made by the best valuers are greater in one place than in another. I say it is impossible to lay down any general rule, and to prescribe that draining shall extend over so many years, chalking over so many, and so on. I would therefore have a schedule framed for each neighbourhood, and then those circumstances which influence the matter in the particular locality would have their due weight. Whereas in one district the period over which the tenant would be entitled to compensation would be 12 years, and in another seven would be sufficient; by the adoption of a schedule fitted to each locality justice would be done to all parties. In every agreement the items should be specified, and nothing should be taken upon trust. Not only should there be a specification of the items for which allowance is to be made, but there should also be, as far as practicable, a statement of the nature of the evidence to be given in support of the tenant's claim to compensation, so as to guard against any mischief which might result from misapprehension, or from improper motives on the part of the valuer. I would, in fact, vest in the valuer the least possible amount of discretion, leaving him to decide simply upon what was placed before him, upon the nature of the evidence, and the quality of the work performed. In every case bills should be produced when the articles were purchased, and a statement given in of the places where the articles were obtained, and the distance they were brought, so as to enable the arbitrators or umpire to estimate the correctness and reasonableness of the charges. The arbitrators should not, however, be wholly governed by the outlay, inasmuch as by an injudicious mode of expenditure an unnecessary cost may have been incurred, and the tenant should only be allowed the fair expenses of the operation as it could be executed in the neighbourhood. Now, gentlemen, as I said at the outset, I hope we shall adopt some resolution of a practical and tangible character, in order to remove (I am now speaking advisedly) the misapprehension which exists amongst landlords in reference to this question. I know that a feeling does exist among landed proprietors that they may be suddenly and unexpectedly called upon to make large allowances, for which they may not be able to provide, and that undue advantage may be taken of them. I know there is such a feeling, for the fact has been communicated to me; and, though I myself consider it entirely unfounded, we must not omit to do what we can to remove it. Now, I trust that the principles with which the minds of valuers generally throughout the country are imbued are such, that, although there may be some few black sheep amongst the number—as there will be in almost all classes of society—they are, as a body, well fitted to deal with this subject, and to do justice between the parties. But, further, it should, I think, be remembered that the interest of such men is, as I before observed, almost as much bound up with the landlords as with the tenantry of the country. If there are valuations on the one side, there must be valuations on the other.—Mr. Shaw was followed by a number of other speakers, and the discussion concluded by the adoption of the following resolution: "That in case of valuations between the landlord or the incoming tenant and the outgoing tenant, justice to the parties may be amply secured by defining in the agreement the period over which the claim for compensation should extend; the operations or articles for which the tenant should be entitled to claim; and, as far as possible, the nature of the evidence which should be furnished to the valuers in case of reference to arbitration."

After this meeting another was immediately held for the purpose of presenting to Mr. Shaw a Testimonial subscribed for by tenant farmers, in acknowledgment of his services as the advocate of tenant-right. It consisted of a handsome salver and a silver tea and coffee service, more remarkable for solidity and massiveness than for anything like ornamental display. The following inscription was engraved on the salver: "Tenant Right. To William Shaw, Esq., a mark of esteem and admiration for the manner in which he has so long and ably advocated the tenant farmers' rights, this token is offered by some of those friends who appreciate the conduct of the man and the justice of the cause.—London Farmers' Club, April, 1850."

Calendar of Operations.

MAY.

EAST SUFFOLK FARM, *May* 27.—Horse and hand-hoeing Beans, horse-hoeing Wheat and Barley furrows; hand-hoeing Barley, &c.; preparing land for Swedes and other Turnips, which will be manured, if weather permits, in a few days; also ploughing between the baulks where the Mangold Wurzel are planted. During the last ten days the Wheats are very much improved in appearance; they were then looking yellow, now of a healthy strong green, both on clay and mixed soils. The Barleys, also, are greatly improved; a few days more of cold and wet would have put them past recovery; they now, however, are promising. Clover and Grass very short; and unless warmer and kindlier weather for their growth succeed, they will be a very light swath. The late frosty nights, and cold wet days, have made the early planted Mangold Wurzel look very yellow, in some cases injured the plant; still we hope an early, although only a three-quarter plant may produce a good, if not the heaviest crop. *W. G.*

EAST LINCOLNSHIRE FARM, *May* 27.—Until very lately this month has been unusually cold for May; north and north-east winds prevailing, with more than one sharp frost, which has consequently retarded vegetation, the pastures being still short; the weather, however, now seems becoming more favourable, with some genial showers. It has been a fine time for stirring the Turnip fallows, in which occupation we are now engaged. We generally sow about a month after May-day. Sheep washing took place last week; the clipping begins 10 days after, and is finished in two days: the men coming when they can, on Saturday and Monday: there are about 800 to clip; the lambs are now growing strong and healthy. We have about 30 calves reared and rearing. The 18 steers mentioned in last report were forced to go at a very low figure. The Wheats are looking remarkably well; which report applies to Lincolnshire generally. A large breadth of Potatoes has been planted in the fens this year. We have been, generally speaking, fortunate with them in these parts, last year's being very fine; and it is probable the disease is now disappearing altogether. *H. E.*

Notices to Correspondents.

ABSTINENCE FROM INTOXICATING LIQUORS: *C Turner*. We must confine the discussion to the economics of the question, and we must endeavour to avoid the use of terms which can only irritate and annoy. A statement may be untrue without being "false."

AGRICULTURAL SOCIETY OF ENGLAND: *A Scotsman* may obtain its rules by application to the Secretary, 12, Hanover-square, London. The improvement of the labourer is one of its objects. Agricultural servants are generally engaged by the month: unless they are mere day labourers, when they can be dismissed without notice. They are often engaged at hiring markets, or, as they are sometimes called, "mops."

AMERICAN CHURNS: *Rusticus*. We cannot reply to questions here whose answers ought to be in our advertising columns.

A TON OF SWEDES: *T D*. It is generally supposed able to produce an imperial stone of beef. That is a very good return from it.

DISEASED PIGS: *Navan*. With regard to the hens, we think there must be some error in diet or locality, which should if possible be discovered or removed. For the pigs we would recommend the following: 20 grains supertartrate of potash, 15 grains nitrate of potash, 1 grain submuriate of mercury, 20 grains sulphur, 1 grain tartarised antimony. One of these powders to be given in the food twice a day for three successive days. *W C S.*

DISEASES OF FOWLS: *An Irish Subscriber* is informed that Spanish fowls are liable, in severe weather, to a sort of chilblain, or frost-bitten sore on the comb, for which the coming warm weather, together with high feeding, is the best remedy; but the case may be aided by washing the part with any stimulating lotion that would have efficacy on a human patient, and which a druggist will supply. After an eye is lost, there is little chance of saving the life of the bird, but in the earlier stages of the disease a solution of sulphate of zinc is an excellent eye-water.

FARM HORSES: *T M C*. We give our horses about 10 lbs. of Oats a day, and Clover *ad lib*. during the summer months. They eat a very variable quantity, sometimes nearly a cwt. in the day, though about 60 lbs. is their ordinary consumption.

GUANO: *Sandwich*. You had better apply the superphosphate of lime and the guano separately: and let some such operation as ploughing or scarifying intervene; 2 cwt. of each per acre will be a good dressing.

GUTTA PERCHA HOSE: *Messrs. Burgess and Key*. The passage referred to is a report received from the Secretary of the English Agricultural Society. The mistake originated there, and you had better apply for its correction to him. We had the pleasure of inspecting your hose a year or two ago, and know its excellent quality.

LABOUR: *J F*. There is an essay "On Wages paid for Labour of different kinds," in the 7th vol. of the English Agricultural Society's Journal; and another in our vol. for 1846.

LENTILS: *Subscriber*. They are the seed of Ervum lens—a plant grown in France, Holland, &c., to a considerable extent. They are used as food in soups, and the haulm is given to cattle. The Grass for lawns should contain per acre on medium soils—6 lbs. of Cynosurus cristatus, 3 lbs. of Fustuca duriuscula, 2 lbs. of F. tenuifolia, 20 lbs. of Lolium perenne, 3½ lbs. of Poa nemoralis, 1½ lb. of P. trivialis, 7 lbs. of Trifolium repens, 2 lbs. of T. minus; or, in all, 45½ lbs. per acre.

PAXTON'S COTTAGERS' CALENDAR may be had at the Office of this Paper, or of any bookseller, price 3*d*., or 5*s*. for 25 copies for distribution amongst cottage tenantry.

SHELL-LESS EGGS: *F D K* is advised to let her golden bantam hen that always lays shell-less eggs, have two or three oyster shells, calcined and crushed, thrown down to her daily; also two or three shells of the eggs that have been used in the house, besides bones to pick, and free access to insect food. But the laying of shell-less eggs arises from two causes: first, the inability of the hen to obtain a sufficiency of phosphate of lime, and secondly, from derangement and over irritably of the ovarium; if this has become chronic, a cure is not likely to be effected, and the fowl had better be sent to table while still in good condition. The same answer will apply to *F D S*.

STEAM ENGINE, &c.: *Mr Crockford's* machinery is already disposed of.

WATER: *A Constant Reader*. Water in an iron tank will not injure cattle, and it is preferable to cold water fresh from the well. *W.C.S.*

*** Communications reaching town after Wednesday cannot be answered till the following week.

Markets.

COVENT GARDEN, JUNE 1.

Vegetables are well supplied. Strawberries and Hothouse Grapes are both plentiful, and the same may be said of Pine-apples. Some Peaches and Nectarines may be obtained. Walnuts and Chestnuts are abundant; Oranges and Lemons sufficient for the demand. Young Carrots and Turnips may be had at from 6d. to 1s. 6d. a bunch; some green Peas of good quality have been supplied at 12s. a quart. Frame Potatoes fetch from 1s. to 1s. 6d. per pound. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, and Rhubarb are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Cinerarias, Lily of the Valley, Pinks, Carnations, Rhododendrons, Ranunculuses, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 10s	Lemons, per doz., 1s to 2s
Grapes, hothouse, p.lb., 5s to 10s	Oranges, per doz., 9d to 1s 6d

Cucumbers, each, 6d to 2s	Mint, green, per bunch, 2d
Leeks, per bunch, 1d to 2d	Watercress, p. doz. bunches, 6d to 9d
Celery, p. bundle, 8d to 1s 6d	Horse Radish, p. bdl., 1s to 4s
Carrots, per bun., 9d to 1s	
Spinach p. sieve, 9d	

POTATOES.—SOUTHWARK, May 27.

The Committee report that the arrivals during the past week have been limited, both coastwise and Continental, but the demand, from the mild weather and the holidays, not being great, it has been equal to our wants. The following are this day's quotations:—York Regents, 80s. to 160s. per ton; Scotch cups, 65s. to 80s.; ditto whites, 50s. to 60s.; French whites, 40s. to 70s.; Rhenish do., 50s. to 75s.; Belgian do., 60s. to 70s.; Dutch, 45s. to 55s.

HAY.—Per Load of 36 Trusses.

SMITHFIELD, May 30.

New Hay	—	—	Straw	24	26
Old Clover	80	84			

SMITHFIELD, MONDAY, May 27.

The number of Beasts is not quite so large; we are consequently enabled to quote 3s. 6d. again for choicest qualities. A pretty good clearance is effected. We have not quite so many Sheep and Lambs as on Monday last; however trade is dull, but prices are certainly on the average better. Trade is heavy for Calves, and it is exceedingly difficult to make anything over 4s. of the choicest. From Holland and Germany there are 150 Beasts, 1000 Sheep, and 115 Calves; from Scotland, 300 Beasts; and 2200 from Norfolk and Suffolk.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c. ...	3	4 to 3	6	
Best Short-horns	3	2 — 3	4	
2d quality Beasts	2	8 — 3	0	
Best Downs and Half-breds	—	...		
Ditto Shorn ...	3	8 — 4	0	

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools		to ...		
Ditto Shorn ...	3	6 — 3	8	
Ewes & 2d quality ...	—	...		
Ditto Shorn ...	2	10 — 3	4	
Lambs	4	8 — 5	4	
Calves	3	0 — 4	0	
Pigs	3	0 — 4	0	

Beasts, 3317; Sheep and Lambs, 22,850; Calves, 190; Pigs, 320.

FRIDAY, May 31.

We have a large supply of Beasts, and a dull trade; buyers are very cautious, the weather being hot. Prices are on the average about 2d. per 8 lbs. lower. The number of Sheep and Lambs is considerable; the trade is dull, and it is exceedingly difficult to maintain Monday's quotations. Calves are plentiful; although a choice one still makes 4s., this is an extreme price. From Germany and Holland there are 49 Beasts, 530 Sheep, and 204 Calves; from Scotland, 120 Beasts; from Norfolk and Suffolk, 400; and 121 Milch Cows from the home counties.

Best Scots, Herefords, &c. ...	3	2 to 3	4
Best Short-horns	3	0 — 3	2
2d quality Beasts	2	6 — 2	10
Best Downs and Half-breds	—	...	
Ditto Shorn ...	3	8 — 4	0

Best Long-wools		to ...	
Ditto Shorn ...	3	4 — 3	8
Ewes & 2d quality ...	—	...	
Ditto Shorn ...	2	10 — 3	2
Lambs	4	8 — 5	4
Calves	3	0 — 4	0
Pigs	3	0 — 4	0

COAL MARKET.—FRIDAY, May 31.

Carr's Hartley, 13s. 6d.; West Hartley, 13s. 6d.; Wallsend Braddyll's Hetton, 15s. 6d.; Wallsend Haswell, 16s. 6d.; Wallsend Hetton, 16s. 6d.; Wallsend Lambton, 16s.; Wallsend Stewart's, 16s. 6d.; Wallsend Tees, 16s. 6d.—Ships at market, 218.

HOPS.—FRIDAY, May 31.

Messrs. PATTENDEN and SMITH report that there is considerably more doing in all kinds of Hops, more particularly in fine yearlings, which were advanced about 15s. per cwt. from the lowest point.

Mid. and East Kents ... p. cwt.	16Cs to 20Cs
Weald of Kents ...	130 — 160

MARK LANE.

MONDAY, MAY 27.—The supply of English Wheat from Essex, Kent, and Suffolk to this morning's market was small, and cleared (partly on speculation), at fully the prices of this day se'nnight. Foreign met an improved but retail demand at our quotations of Monday last.—Barley barely supports last week's prices.—Beans must be written 1s. per qr. cheaper.—Peas are unaltered in value.—Inferior Oats are the turn lower, other sorts as last quoted.

FRIDAY, MAY 31.—The arrivals of English corn this week have been small, those of foreign Wheat good, but the market being thinly attended, business in all descriptions of grain was of a limited and retail character, the prices of each article may be considered nominally the same as on Monday.—Indian Corn must be quoted 1s. per qr. cheaper.—The Flour trade is heavy. —The weather since our last has been finer and somewhat forcing—rather too much so for the Wheat in some districts; large foreign arrivals have caused it in one or two of the principal markets to recede about 1s. per qr. in value, but generally great confidence is manifested in the maintenance of present prices. The value of Beans and Barley has slightly receded, but no alteration from our quotations of Peas and Oats is observable.

LIVERPOOL, FRIDAY, MAY 31.—There was a thin attendance of millers and dealers at our corn exchange this morning. Wheat was taken sparingly by the local buyers, but we had more demand from a distance. Flour was unchanged in value. Good Oats were scarce; the best Irish sold at 2s. 7½d. per 45 lbs. which is an improvement of ½d. per bushel. Barley, Beans, and Peas were without alterations. The demand for Indian Corn was fair, but the fresh supply being good, 6d. to 1s. per quarter less money than on Tuesday was taken on sales, ex ship.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on THURSDAY, June 6th, a first-rate Collection of DAHLIAS, also the newest varieties of Fuchsias, Verbenas, Geraniums, Heartsease, Roses, and other plants in bloom; together with a variety of Ornamental Plants for bedding.—May be viewed the Morning of Sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to sell by public Auction, on the premises, Sheep-lane, Cambridge-heath, Hackney, on MONDAY, June 10, at 1 o'clock, Three Newly-erected GREENHOUSES, each 120 feet long; about 1000 feet of Hot-water Pipe, Boilers, and Cisterns, Stages, a quantity of Slate, Shelving, &c.—May be viewed two days prior to the sale. Catalogues may be had on the premises, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

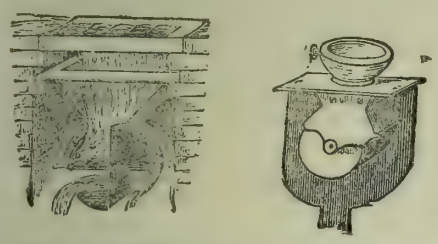
CHELSEA.

MR. D. A. RAMSAY will sell by Auction, on the premises (Cook's Ground, King's-road, Chelsea), by order of Mr. HARRIS (the ground being taken for building purposes), on THURSDAY, June 6, at 1 o'clock, without any reserve, all the Stock, &c., comprising a quantity of Greenhouse Plants, Pansies, Evergreens, &c.; also a small Greenhouse, Box, Lights &c. May be viewed the day prior and morning of sale. Catalogues to be had on the premises, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, near London.

MR. BATEMAN'S CELEBRATED COLLECTION OF ORCHIDS.—The Committee for providing a Church, Parsonage, and Schools in the wild, populous, and neglected district of Biddulph Moor, are happy to inform the growers of Orchidaceous Plants, that Mr. Bateman, in promotion of this important object, has generously placed at their disposal about 400 of his SPECIMEN PLANTS, among which will be found nearly all the rarest and most beautiful species at present in cultivation. These will be submitted for unreserved sale by Auction, by Mr. J. C. STEVENS, at his Great Room, 38, King-street, Covent-garden, on TUESDAY, the 11th day of June, at 12 for 1 o'clock, on the morning of which day they will be on view.—Catalogues may be had on application to the Auctioneer, or from either of the Secretaries, who will be happy to give any additional information respecting the projected Church, &c.

Rev. EDWARD WILSON, Buglawton, near Congleton,
Rev. JOHN SUTCLIFFE, Oatlands, ditto,
Honorary Secretaries.

TO FLORISTS, NURSERYMEN, AND OTHERS.



PARTNERSHIP.—A rare opportunity now offers itself for going into a most profitable Business. A Nurseryman of great experience, and with a thorough knowledge of Floriculture and Gardening in all its branches, and having two establishments at some distance from each other, is desirous of meeting with a competent PARTNER to take charge of one of them, his own personal superintendence being indispensably required at the other, where there is an opportunity of greatly increasing the present amount of business. The capital required is moderate, and the profits large. Or one of the concerns would be sold at a reasonable premium.—For further particulars apply to HENRY EDGER, Esq., Solicitor, 4, Verulam Buildings, Gray's-inn, London.

TO NOBLEMEN, LANDED PROPRIETORS, AGRICULTURISTS, ENGINEERS, CONTRACTORS, AND OTHERS.

THE PATENT ALKALI COMPANY'S Metallic Black, Bright-red, and Purple-brown PAINTS are applicable for covering iron and wood work of every description, also stuccoed and brick buildings, and are remarkable for their superior preserving properties, cheapness, and durability.—Offices of the Company, 1, New Broad-street, London.

JOHN A, WEST, Secretary.

TO BUILDERS, &c.
IMPORTANT SANITARY INVENTION.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

C. MARSDEN'S ROTARY WATER-CLOSETS and EFFLUVIA TRAPS, acknowledged by the most scientific to be the best and simplest self-acting Water-Closets and Effluvia Traps ever invented. A stench arises at the time of using all other Water-Closets—with this invention it can be got rid of. It is constructed in the shape of a drum, with four receivers or buckets caused to revolve by the weight of the matters falling into one of the receivers, when it instantly empties itself into the drain or sewer, and another bucket is ready from the opposite side to take its place, and two others on their ascent, to be emptied in their turn, while any upward escape of effluvia during these successive changes is effectually prevented, by overhanging and side flaps of vulcanised India-rubber, so placed that it is impossible to get choked up or get out of order; no balance weight or handles, no D or syphon traps required with these Closets. All traps that require water to keep them air-tight must necessarily leave a sediment to putrify. The value cannot be believed unless seen and tested.—Also Manufacturer of Decorative Marble Paper-hanging.—Waterloo House, Kingsland-road, near the Bridge.

IRON AND WIRE FENCING,
AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS,
252, OXFORD-STREET (NEAR HYDE PARK),
And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of
PLAIN AND ORNAMENTAL IRON AND WIRE FENCING,
Park Entrance, Carriage and Field Gates, Wickets, &c.;

26 oz. ,, 3½*d.* 7½*d.* ,, ,, ,,

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the Excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

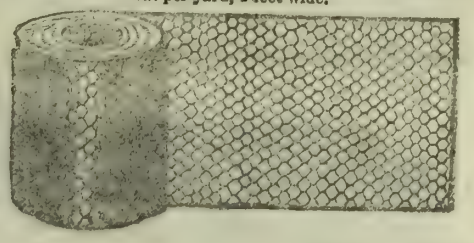
The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.



Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7*d.* per yd.	5*d.* per yd.
2-inch ,, strong ,,	...	9 ,,	6½ ,,
2-inch ,, extra strong ,,	...	12 ,,	9 ,,
1⅝-inch ,, light ,,	...	8 ,,	6 ,,
1⅝-inch ,, strong ,,	...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,,	...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	..	£3 15 0
Do. of 100 yards, 24 ins. wide	..	..	5 0 0
Do. of 100 yards, 30 ins. wide	..	..	6 5 0
Do. of 100 yards, 36 ins. wide	..	..	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

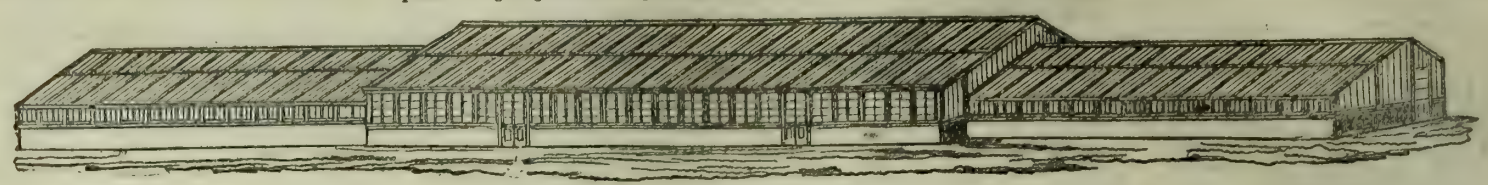
AGRICULTURAL DRAINING: THE DERBY LEVEL.—A Very Superior Draining Level, of great simplicity, price 3*l.* 5*s.*, to be had of the Maker, Mr. JOHN DAVIS, Optician, Derby. The above is securely packed and sent to any part of the empire.

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

D. W. MITCHELL, B.A., Secretary.

THE SUMMER RIDE OR PROMENADE.—The peculiar virtues of C. and A. OLDRIDGE'S BALM OF COLUMBIA completely remove the difficulty experienced by Ladies in preserving their ringlets after exercise; its use so invigorates the hair, that tresses, previously the straightest and most destitute of curl, rapidly acquire a vigour which maintains in permanent ringlets the head-dress of the most persevering votary of the ball-room, the ride, or the promenade. After the Minerals and Vegetables of the Old World have been compounded in all imaginable ways in fruitless attempts to discover so important a desideratum, we are indebted to the Western Hemisphere for furnishing the basis of

OLDRIDGE'S BALM OF COLUMBIA,



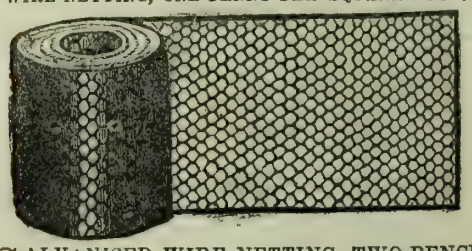
the efficacy of which in preserving, strengthening, and renewing the hair has become a matter of notoriety among all civilised nations. Its restorative virtues are indeed a proverb, and the most satisfactory attestations to its infallibility in reproducing hair upon persons otherwise hopelessly bald, have been published from time to time by the Proprietors, 13, Wellington-street North, Strand, a few doors above the Lyceum Theatre on the opposite side.

3*s.* 6*d.*, 6*s.*, and 11*s.* per Bottle; no other prices are genuine. When you ask for "Oldridge's Balm," never let the shopkeepers persuade you to buy any other article as a substitute.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.



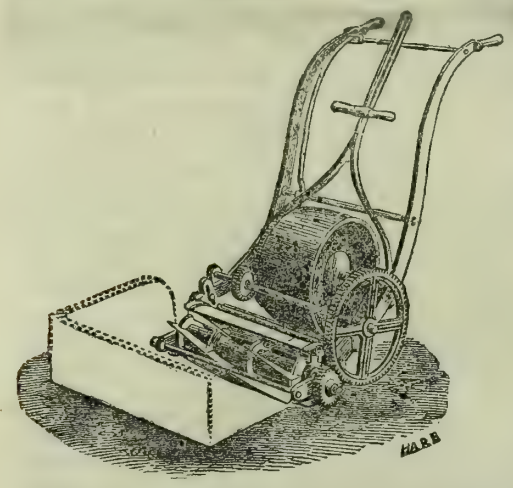
Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

WIRE NETTING, ONE PENNY PER SQUARE FOOT.



GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3d.	per yard	30 inches wide	7½d.	per yard
18 "	4½d.	"	36 "	9d.	"
14 "	6d.	"	48 "	1s.	"

Galvanised do., 1d. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each; Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

BUDDING'S PATENT MOWING MACHINE.

This Machine may be worked by persons who cannot use a Scythe. It may be adjusted to cut any length, and leaves a more even surface than can be produced by the most skilful mower. The Grass may be cut when dry, and may be collected in the box, which enables the gardener to cut his lawns at the most convenient time, and renders sweeping afterwards unnecessary, while with the same amount of labour more than double the quantity of work can be done than with a scythe. Various sizes are made both for manual and horse power, and the prices have this year been reduced to the lowest possible scale. There are now between 3000 and 4000 of these Machines in use.

Manufactured and sold by JOHN FERRABEE and SONS, Phœnix Iron Works, near Stroud, Gloucestershire.

GENERAL WHOLESALE AGENTS.—Messrs. Ransomes and May, Ipswich.

AGENTS.—Messrs. Mapplebeck & Lowe, Bull Ring, Birmingham; Messrs. Lister and Lees, Cateaton-street, Manchester; Mr. Wm. Drury, Castle-street, Liverpool; Messrs. J. Nelson and Sons, 47, Briggate, Leeds; Mr. T. Johnson, Leicester; Messrs. Stratton, Hughes, and Co., Clarke-street, Bristol.

A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being at once a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sun-burn, Redness, &c., and by its balsamic and healing qualities, render the skin soft, pliable, and free from dryness, scurf, &c, clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2s. 9d., with directions for using it, by all Medicine Vendors and Perfumers.

DOMESTIC ECONOMY, SANITARY REFORM, FIRESIDE STORIES, VALUABLE RECIPES, FAMILY SECRETS, COTTAGE GARDENING, &c.

THE FAMILY ECONOMIST contains valuable articles on the above subjects—written in a plain, vigorous style. It is one of the most entertaining and useful periodicals published.

"There are few cheap periodicals which better deserve encouragement than this little work."—*Morning Herald.*

"It is admirably adapted for distribution among the poor, and even the rich might learn a great deal from it."—*Belle Assemblee.*

Price a Penny a Month, a Shilling a Year.

VOLUMES FOR ALL.

THE FAMILY ECONOMIST, Vols. 1 and 2,—1848, 1849. As a present to a servant or poor neighbour, more useful or acceptable Volumes cannot be selected. *Price Eighteen-pence Boards; One Shilling, Paper Wrapper.*

London: GROOMBRIDGE and SONS, Paternoster-row; And all Booksellers.

A TREATISE ON AN IMPROVED MODE OF CULTIVATING THE CUCUMBER AND MELON. By GEORGE MILLS, F.H.S.

Third edition with additions. Also, by the same author, one volume, price 5s. cloth, A TREATISE ON THE CULTURE OF THE PINE APPLE.

London: W. S. ORR and Co., 2, Amen-corner.

Post 8vo, 7s. 6d. cloth,

A HANDBOOK OF FIELD BOTANY, comprising the Flowering Plants and Ferns indigenous to the British Isles, arranged according to the natural system. The Orders, Genera, and Species carefully analysed, so as to facilitate their discrimination. With a Synoptical Table of the Genera, according to the Linnæan classification, and a Glossary of those Terms most commonly in use.

By WM. STEELE, A.B., M.B., T.C.D., &c.

"Here is another of those useful manuals which enable the student of British botany to ascertain the names of plants without difficulty. The arrangement is clear, and the distribution of the type, though novel, like Roemer's Synopsis, is, nevertheless, such as to catch the eye readily when once familiar with it. The book will be a very useful travelling companion."—*Professor Lindley's Gardeners' Chronicle.*

Dublin: JAMES M'GLASHAN, 21, D'Olier-street. London: WM. S. ORR and Co. Sold by all booksellers.

NEW WORK ON GARDENING AND BOTANY.

On the 31st ult. was published, price 2s. 6d., No. IV. of

G. WILLIS'S CATALOGUE OF SECOND-HAND BOOKS

ON NATURAL HISTORY, GARDENING, RURAL ECONOMY, &c.

Containing many choice and Valuable Works, at very low prices, among which are the following, now on sale.

BAXTER'S BRITISH PHÆNOGAMOUS BOTANY; or, Figures and Descriptions of the Genera of British Flowering Plants, with the Scientific and English Names, Indexes, &c. By W. BAXTER, Curator of the Oxford Botanic Garden, WITH 509 COLOURED PLATES, complete in 6 vols. 8vo, cloth, 3l. 15s. Another set, 6 vols. hf. bd. morocco gilt, top edges gilt, 4l. 10s. (pub. at 9l. unbound), Oxford. 1834-43

CUVIER'S ANIMAL KINGDOM, arranged according to its Organisation; being a description of Quadrupeds, Birds, Fishes, Insects, Shells, &c. By CUVIER and LATREILLE. Translated from the last French Edition. With 300 Sheets of Coloured Plates. 8 vols. 8vo, half-morocco, gilt tops, only 3l. 10s. (pub. at 8l. 8s.) 1837

*** This celebrated work embraces the whole range of Natural History, and is the only one suitable for a "Home Library." The Plates are engraved upon steel, and nearly all coloured, comprising upwards of 4000 figures of Quadrupeds, Birds, Fishes, Insects, &c.

DON'S GENERAL SYSTEM OF GARDENING AND BOTANY, containing a Description of all Plants hitherto known; their Generic and Specific Characters, place of Growth, Culture, and Uses in Medicine and Domestic Economy, &c., founded upon "Miller's Gardener's Dictionary," and arranged according to the Natural System; *numerous woodcuts*, 4 vols. 4to, cloth, 1l. 10s. (pub. at 14l. 8s.) 1831-38

LOUDON'S ARBORETUM ET FRUTICETUM BRITANNICUM; or, the Trees and Shrubs of Britain, Native and Foreign, Hardy and Half-hardy, with their Propagation, Culture, Management, and Uses, *with about 400 plates and upwards of 2500 woodcuts of Trees and Shrubs*, 8 vols. 8vo, *extra cloth*, only 4l. 4s. (pub. at 10l.) 1838

REPTON'S WORKS ON LANDSCAPE GARDENING and LANDSCAPE ARCHITECTURE, new edition, with large Additions, by J. C. Loudon, illustrated by 250 engravings, thick 8vo, cloth, ONLY 14s. (pub. at 1l. 10s.) 1840

THE FARMERS' LIBRARY, containing the last revised editions of the celebrated Treatises on the Horse, the Dog, the Ox, Sheep, the Hog, Poultry, and Bees. By YOUATT and MARTIN. *Illustrated by 400 Woodcuts.* The whole bound in two large volumes, royal 8vo, ONLY 18s. (pub. at 1l. 15s.) C. Knight, 1842

This most valuable work was published under the superintendence of the Useful Knowledge Society, and comprises the best and latest treatises on each subject.

WOOD'S INDEX ENTOMOLOGICUS; or a complete Illustrated Catalogue of the Lepidopterous Insects of Great Britain, *comprising 1944 Figures of Butterflies and Moths, beautifully engraved* and MOST CAREFULLY COLOURED, 8vo, *new cloth*, 3l. 10s. (pub. at 8l. 8s.) 1845

This is by far the most complete illustrated work on British Entomology, and is especially adapted for those forming collections, as it comprises Figures and Descriptions of every known species of Butterflies and Moths.

GEORGE WILLIS, Great Piazza, Covent-garden, London.

ALLSOPP'S BURTON AND EAST INDIA PALE ALES.—Messrs. S. ALLSOPP and SONS beg to call the attention of the public to their East India, Pale, and other Burton Ales, which may be obtained in casks of 18 gallons and upwards, either singly or in any quantity, by application to the Brewery, Burton-on-Trent, or on the same terms at their respective Stores, as follows:—61, King William-street, London; Cook-street, Liverpool; under the Exchange, Ducie-place, Manchester; and at the Market-place, High-street, Birmingham.

METCALFE AND CO.'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JUNE 1, 1850.

ROYAL BOTANIC SOCIETY, REGENT'S PARK. The Second EXHIBITION THIS SEASON OF PLANTS, FLOWERS, AND FRUIT, will take place on WEDNESDAY next, the 12th instant. Tickets to be obtained at the Gardens, only by orders from Fellows of the Society, price 5*s*. each; or on the day of Exhibition, 7*s*. 6*d*. The Gates open at 2 o'clock.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—Under the patronage of her Most Gracious Majesty the QUEEN.—The THIRD EXHIBITION of the season will be held at the Royal Surrey Zoological Gardens, on WEDNESDAY, the 19th JUNE (open to all exhibitors), when Prizes will be awarded for the following productions, viz., Miscellaneous, Orchids, and Specimen Plants, Pelargoniums, Cape Heaths, Roses, Pinks, Ranunculus, and Fruit. In addition to the Prizes offered by the Society, Messrs. Paul and Son, of Cheshunt, offer Two Prizes for 12 New Roses, to Amateurs, and 17*l*. 10*s*. will be awarded for Seedling Pelargoniums (see Pelargonium Fund advertisement in this Paper). The following Exhibitions will also take place at the Royal Surrey Zoological Gardens, on Tuesday, July 23d, and Wednesday, September 4th. List of Prizes, and the Rules for Exhibitors, may be obtained from JOHN TAYLOR NEVILLE, Secretary.
Ebenezer House, Peckham, Surrey.

TO THE SUBSCRIBERS TO THE GARDENERS' BENEVOLENT INSTITUTION. —Your Votes are earnestly solicited for JOHN HURDEN, of Claverton-street, Bath, a very deserving Man, in the 67th year of his age, and for the last six years has been unable to work or walk without crutches, having broken his thigh by a fall from a ladder whilst gathering Pears. His case is strongly recommended by Mr. POND, Devonshire Cottage; Mr. G. WARREN, Coombe, Devon; and many others.—Bath, June 8.

TO THE SUBSCRIBERS TO THE GARDENERS' BENEVOLENT INSTITUTION. —The case of JOHN SHEPHERD, No. 7 on the List for the next Election, and the Fourth Application, is most respectfully recommended to the Subscribers. Proxies will be received by Mr. GRISSELL, 11, New Palace-yard, Westminster.

AMERICAN NURSERY, BAGSHOT, SURREY. JOHN WATERER begs to announce that his splendid collection of AMERICAN PLANTS is now in full bloom, and may be seen gratis.
The Nursery is near the Farnborough station of the South Western Railway, and three miles from the Blackwater station of the South Eastern Railway.

EXHIBITION OF AMERICAN PLANTS, KNAP HILL, WOKING, SURREY. HOSEA WATERER begs to announce that the AMERICAN PLANTS at Knap Hill Nursery are now in bloom, and will continue in perfection during the month of June. As a display of flowers this is perhaps without a rival in this kingdom. May be seen, gratis, any day, except Sunday. The Knap Hill Nursery is within an hour's ride of London, being near the Woking station, South Western Railway, where every train stops, and from whence conveyances may at all times be had. H. WATERER is a principal contributor to the Exhibition in the Botanic Gardens, Regent's Park, orders for seeing which may be obtained on application to Fellows.
Knap Hill Nursery, Woking, Surrey, June 8.

AMERICAN NURSERY, BAGSHOT, SURREY. GEORGE BAKER begs to inform the Nobility and Public his extensive collection of AMERICAN PLANTS are now in bloom, and will continue till the end of this month, and may be seen gratis. The Nursery is about 6 miles from the Staines Station, on the South Western Railway, and 3 from Virginia Water, from whence conveyances may be obtained.
G. BAKER is a contributor to the Exhibition in the Botanic Gardens, Regent's Park.—June 8.

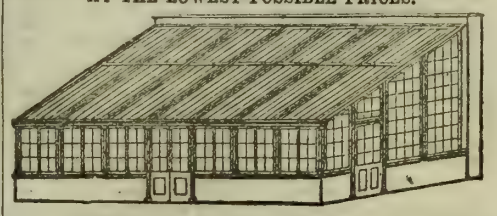
INDIAN CATTLE FOR SALE, AS PARK STOCK. TWO BEAUTIFUL BRAHMIN COWS, of high caste, with their calves, a BULL, and HEIFER. Price moderate. Can be seen in the Prince's Park, Liverpool. For further particulars, apply to Messrs. THOMAS TINLEY and SONS, 8, Orange-court, Liverpool.

MEADOW AND PASTURE GRASS SEEDS. GEORGE GIBBS AND Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32*s*. per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1*s*. 3*d*. per lb.; fine sorts for forming Lawns, 1*s*. 4*d*. per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

LADIES THAT TAKE AN INTEREST IN THEIR FLOWER GARDENS—AND WHO DOES NOT? D. FERGUSON, with much pleasure states he can supply them with well-rooted plants, from cold frames, of first-rate Verbenas, Petunias, Calceolarias, Geraniums, Heliotropes, Fuchsias, Anygillis, Cupheas, Ageratums, Pentstemons, Œnothera microcarpa, &c., for bedding out, on or after the 15th of May, at 1*s*. 6*d*. per dozen, if 5 to 20 dozen are taken; 1*s*. 8*d*. if 20 to 50; above 50, 1*d*. each; and if 100, five dozen will be added: carriage free to London, Birmingham, Leamington, Peterborough, Banbury, Bedford, and all intermediate stations on the North-Western Railway. Lists marked for selection at the above prices, sent free on application: but to those not already in possession of a collection, D. F. advises parties to state the colour and quantity they want, and leave the selection to him; and to those who have no convenience for wintering plants, they will find it advantageous to give their annual orders in July or August for the following Spring, as they, on taking five dozen and upwards, will have the choice, not only of those marked in the list, but any other bedding-out plant, if possible to procure, at equally low prices.
Letters directed Buckingham, in place of Aylesbury, reach D. F. one day sooner: where all post-office orders are requested to be made payable.

IRIS GERMANICA, PHLOX, &c. JOHN SALTER begs to inform the Amateurs of these beautiful flowers that his unique Collection of IRIS GERMANICA, containing upwards of 200 varieties, is now in bloom, and may be seen daily. His new Phlox and Verbenas will be in flower by the end of the month.
Versailles Nursery, William-street, Hammersmith Turnpike.

TURNIP SEEDS. DUNCAN HAIRS having personally superintended the selection and growth of the Turnip Seed he offers, can with confidence recommend them as genuine. Likewise, AGRICULTURAL SEEDS of every description, of first-rate quality and low in price. Catalogues with prices free.
Garden Tools, Nets, and every article connected with the trade wholesale and retail.
Seedsman and Florist, 109, St. Martin's-lane, Charing-cross.



MIMULUS INSIGNIS. HENRY MAJOR, Knosthorpe, near Leeds, has ready for sending out healthy plants of the above most beautiful MIMULUS, price 3*s*. 6*d*. each, or three plants for 7*s*. 6*d*., post free.
This Mimulus has been very kindly presented to H. M. by the raiser, A. Clapham, Esq., who raised Mimulus "rubinus," and others. The following is the opinion of the Editor of the Gardeners and Farmers' Journal upon it:—"M. H. Your seedling is very attractive. Form excellent; throat bright straw colour deepening to chrome; lip brilliant crimson; edge perfect; throat spotted with rich crimson; the consistency of the flower most desirable."
It is respectfully requested that all orders be accompanied by a Post-office order or postage stamps.

NORLAND NURSERY, NOTTING-HILL. W. TOWNSEND has the following Plants on sale: Fuchsia spectabile, 2*s*. 6*d*.; Mitraria coccinea, 2*s*. 6*d*.; Dielytra spectabile, from 2*s*. 6*d*.; Cantua pyrifolia, 2*s*. 6*d*.; Tropæolum Smithii, 2*s*. 6*d*.; Rose Noisette pumila alba, 1*s*. Also four new Petunias, viz., Prince of Wales, 3*s*. 6*d*.; Enchantress, 3*s*. 6*d*.; Rosea superba, 2*s*. 6*d*.; and Great Britain, 2*s*. 6*d*., the two former were raised by G. Lennox, Esq., and obtained first-class certificates at the June show (1849) of the Horticultural Society.
W. T. has the entire stock; also a selection of the new (1850) Verbenas, Petunias, Mimulus, Antirrhinums, and Chrysanthemums sent out by Chauviere, Dufoy, and the most eminent growers, at 1*l*. per dozen. The older varieties at 4*s*. per dozen. Catalogues on application.
Remittance from unknown correspondents.

HENRY BIERTUMPFEL, MANUFACTURER OF IMPROVED AND PATENT GARDEN SYRINGES, AND ORNAMENTAL ICE MOULDS, 68, Albany-street, Regent's-park, London, respectfully tenders his thanks to Gentlemen, Florists, Nurserymen, &c., for their continued and extending patronage, and ventures to hope that he may still be honoured with their commands. To those who have not at present used his Improved and Patent Garden Syringe, he respectfully solicits a trial, as he can confidently recommend them to be unsurpassed either for durability, cheapness, or utility; and being manufactured of the Imperial White Metal, they never corrode or cause verdigrease, to which the brass ones are liable.
Improved Garden Syringe with two Roses, each 10*s*.; ditto, with return end, each 13*s*.; ditto, with Patent Syringe with three Roses, each 12*s*. A liberal allowance made to the Trade.
H. B. would also take this opportunity of calling attention to his New and Ornamental Ice Moulds, they being a very great improvement upon the old shape. They are used and approved of by some of the first Club Houses in London, and by all the most eminent Confectioners, and are particularly admired for their elegant and unique shape.
N.B. Made in Pints, 1½ Pints, Quarts, and 3 Pints.

NOVELTY, ELEGANCE, AND DURABILITY. R. RESTELL'S PATENT METALLIC ORNAMENTAL GARDEN LABELS, composed of a combination of metals entirely new, in a variety of different patterns and sizes, are far superior to either zinc or porcelain. These elegant labels are perfectly white and well suited for either Lawns and Conservatories; they require no wire to attach them, but may be rolled round a branch, bent over a flower-stand or pot, or be fixed in the ground perfectly upright. They are calculated to last for 20 years, and may be written upon as freely as paper. If the names are to remain permanently, use ink and a steel pen; if only for the ordinary period, a good lead pencil. The ornamental borders of these labels may be had of any colour upon order, also with numbers, if required. For wine and ale cellars the plain labels will be found very useful.
Prices, varying according to weight, from 1*s*. 6*d*. per dozen. To be had of the principal Seedsmen and Florists, and dealers in horticultural implements, and wholesale at the Manufactory, 35, High-street, Croydon, Surrey.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.
THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.
The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.
Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

G. and J. DEANE are Sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.—DEANE'S Horticultural Tool Warehouse, opening to the Monument, 46, King William-st., London-bridge.

BEE HIVES. GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—127, High Holborn, London.
Agents: WM. DRURY, Castle-street, Liverpool; HALL and WILSON, 50, King-street, Manchester; AUSTIN and M'ASLIN, 168, Trongate, Glasgow.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.
The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.
100 and 200 feet cases of large Sheet Glass, from 2½*d*. per foot. Small ditto, 10*s*. 6*d*. per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.
GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.
PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.
Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.
Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

GLASS WATER PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ½-inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

TO BE DISPOSED OF, the Wholesale Department of an Old and Highly-respectable London Seed Establishment; any one wishing to embark in the trade, or to add to their own business, will find this an opportunity rarely to be met with.—Apply to Messrs. STURMY and SIMPSON, 8, Wellington-street, London-bridge.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1s. 3d. to 1s. 6d. per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7d. to 9d. per foot. HEATING BY HOT WATER.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL AND CO.'S Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

IRON AND WIRE FENCING, AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE PARK), And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of PLAIN AND ORNAMENTAL IRON AND WIRE FENCING, Park Entrance, Carriage and Field Gates, Wickets, &c.; Deer, Sheep, and other Hurdles; Hare and Rabbit-proof Wire Fencing; Iron Bedstead Makers to the Board of Ordnance; And Government Contractors.

The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility, and on the most moderate terms. Drawings made and estimates prepared, if required. The show-rooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6s. per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7s. 9d. a set. Sword-scrapers for Gardens, 1s. 2d. each. Patent Fumigators for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. BOOBBYER and Co.'s (late STURCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

DR. S. NEWINGTON'S HAND-DRILL HOES, with their various fittings. With these Hoes a man or lad can hoe from two to three acres of Wheat, Beans, &c., daily, the tines being made with movable shares and adapted either for stirring or hoeing. Hand-Dibbles, with from 6 to 9 depositors each, Wheel-Dibbles for all corn, Mangold, Carrots, Turnips, &c. Drop-drills, and Hand-sowing Implements for dropping seed at defined intervals in the seams of the plough, or in pressed land, or in drills. A Prospectus and Lecture on Seeding sent gratis on application to Messrs. DUFAUR and Co., Agricultural Depôt, 21, Red-lion-square, Holborn, London. The above Dibbles received the prize given by the Royal Agricultural Society at Norwich.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

PENTSTEMON MURRAYANUM.

JAMES BURLEY, NURSERYMAN, begs to inform the trade, and admirers of the above beautiful plant, that he has a few dozen to dispose of at 18s. per doz.; also 60,000 Drumheads, pricked out plants, at 3s. per thousand.—Post-office orders will oblige, from unknown correspondents, on the Westerham Post-office to JAMES BURLEY, Simpsfield, Surrey.

SHADES FOR GREENHOUSES.

J. WEEKS AND CO., King's-road, Chelsea, HORTICULTURAL BUILDERS, &c.—Greenhouses, Conservatories, Pits, &c., built—or BLINDS, for Shading the same, fixed—in any part of the Country.—A great variety to be seen in operation at their Hothouse Works, King's-road, Chelsea, near London.

COOPER'S PATENT PRESERVED FRUITS IN SYRUP, prepared for the Dessert and other Family purposes.—A small hamper enclosing an assortment of various kinds of Fruit in half-pint jars, one of which contains Raspberries and Currants, the growth of the year 1840, and is still warranted for three years in advance, for family use.—For an order for 7s., directed to Mr. JOHN SMITH, 8, St. John-street, Clerkenwell, London, a hamper will be delivered free of expense to any part of London.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1l. 4s. Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8s., 15s., and 21s., casks inclusive.

PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence: not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2s.; rich brown, 2s. 9d.; greens and light colours 4s. per gallon.

G. BELL and Co., 2, Wellington-street, Goswell-street, London.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1d. per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

TO NOBLEMEN, LANDED PROPRIETORS, AGRICULTURISTS, ENGINEERS, CONTRACTORS, AND OTHERS.

THE PATENT ALKALI COMPANY'S Metallic Black, Bright-red, and Purple-brown PAINTS are applicable for covering iron and wood work of every description, also stuccoed and brick buildings, and are remarkable for their superior preserving properties, cheapness, and durability.—Offices of the Company, 1, New Broad-street, London.

JOHN A. WEST, Secretary.

ALEXANDER SHANKS AND SON, MACHINE MAKERS, Ogilvy-place, Arbroath, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to their IMPROVED GRASS CUTTING ROLLING MACHINE for LAWNS, the completeness of which has now been fully proved. The Machine works with perfect ease, producing a beautiful smooth surface, and attended with a saving of labour of 80 per cent.

A. S. and SON respectfully solicit the attention of the Farmers, Agriculturists, and others to an improved STRAW or HAY CUTTING MACHINE, which they have recently invented. The cheapness and utility of this improved Machine, combined with superior workmanship and durability, enable the inventors confidently to recommend it, as the most profitable Machine of the kind yet sent out. Further particulars and a list of prices may be had, by applying to the makers or to their Agents. Agents for London, Messrs. J. and C. Lee, Nursery and Seedsmen, Hammersmith; Hertford, Mr. George Folkard, Ironmonger; Liverpool, Messrs. Charles D. Young and Co., Castle Buildings, Derby-square; Manchester, Messrs. Francis and James Dickson and Co., Seedsmen, 106, Deansgate; Wakefield, Mr. Wm. Barratt, Nursery and Seedsman, St. Johns; Chester, Messrs. F. and J. Dickson, Nursery and Seedsmen; Glasgow, Messrs. Charles D. Young, and Co., 32, St. Enoch-square; Edinburgh, Messrs. Charles D. Young and Co., 48, North Bridge; Perth, Messrs. Dickson and Turnbull, Nursery and Seedsmen.

FOR WATERING GARDENS, BREWERS' USE, &c. FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATER-PROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	½ in.	⅝ in.	¾ in.	1 in.	1¼ in.	2 in.	2½ in.	3 in.
1 ply ...	0s. 5d.	0s. 6d.	0s. 8d.	0s 10d.	1s. 0d.	1s. 2d.	1s. 4d.	1s. 6d.
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

TO UPLAND FARMERS AND GENTLEMEN REQUIRING A GOOD SUPPLY OF WATER BY THE MOST ECONOMICAL MEANS.

W. NASH has on hand one of his SUPERIOR WINDMILLS, for Raising Water, &c., embracing all the modern Improvements, and combining great power with simple and strong construction, and would form a very handsome and interesting object on any Estate; securing likewise a good supply of Water without expense, beyond the first outlay.—May be seen, and particulars obtained, by applying at the Factory, Ball's-pond, Islington, London.

THE FUNEBRAL CYPRESS—CUPRESSUS FUNEBRIS.

MESSRS. STANDISH AND NOBLE, of the Bagshot Nursery, beg to announce that they are now sending out the above magnificent Weeping Evergreen Tree, the hardiness of which is now proved beyond all doubt; and for particulars proudly refer their patrons to the highest authorities, viz., Dr. Lindley and Sir W. Hooker—see *Gardeners' Chronicle*, April 21, 1849, and April 13, 1850; Curtis's Botanical Magazine, for May; and the Gardeners' Journal, March 9 and 16 for the present year. Strong healthy plants, fit for immediate planting, 21*s.* each.—Bagshot Nursery, Surrey.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE sent prepaid for four penny stamps, for postage. This Catalogue contains a rich assortment of the newest and best plants which can be be procured. The stock of BEDDING PLANTS is unusually strong and fine. Several thousand plants of Verbenas are now ready for sending out, as well as our collection of other plants for bedding, the stock of which is also very extensive, consisting of Geraniums, Fuchsias, Petunias, Dahlias, Chrysanthemums, Anagallis, Bouvardias, Cupheas, Heliotropes, Plumbagos, Lantanas, Salvias, Lobelia Erinus grandiflora and compacta alba, Zauschneria californica, &c.

Persons requiring Plants for beds may depend on receiving a supply, strong, and in fine condition, at low prices.

Seed and Horticultural Establishment, Sudbury, Suffolk.

SUPERB SEEDLING FUCHSIA—"CAPTIVATION."

EDWARD TILEY has much pleasure in offering the above beautiful FUCHSIA, which he is confident will give entire satisfaction. It was exhibited at the Victoria Park Exhibition in September last, and was awarded by the judges an Extra Certificate of Merit, and much admired by all who saw it. It was also sent to Mr. HENDERSON, of the Pine-apple Nursery, Edgeware-road, London, who gave his opinion as follows:—"I received the box containing Fuchsia Blooms quite safe; it is a really good variety—a vast improvement upon Smith's Ne Plus Ultra; tube good, deep red sepals, quite reflexed, I may say curling over, showing its fine violet-purple corolla to great advantage, being clean, smooth, and round. Send me plants of it when you send it out." It was twice sent to the Editor of the *Gardeners' Chronicle*, whose opinion was similar to the foregoing.

E. T. will commence sending out the above, after the 4th day of June, at 10*s.* 6*d.* per plant. The usual allowance to the Trade when three are ordered. They will be sent in strong tin boxes through the post, if required, package and postage free, on receipt of Post-office Order for the amount.—E. TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney Bridge, Bath.

"THE FLOWER OF THE DAY" IS LEE'S NEW VARIEGATED SCARLET GERANIUM.—The habit of the plant is very vigorous, and the variegation perfectly constant. The foliage is bright green, beautifully margined with silver, with a light horse-shoe, and an occasional pink tinge. The trusses are large, of a light scarlet (the most conspicuous colour), and the general effect it produces is elegant beyond description.

"THE FLOWER OF THE DAY" may be seen in bloom at LEE'S Nursery during the present month. On the 1st of August good established plants will be ready for delivery at 10*s.* 6*d.* each, with the usual allowance to the trade when three or more are ordered. Orders will be executed strictly in rotation.—Address, J. and C. LEE, Nursery and Seedsmen, Hammersmith, near London.—June 8.

SELECT PLANTS.

BASS AND BROWN are sending out the following CHOICE SELECTIONS, at the annexed low prices, the plants of which are exceedingly strong and fine.

Goods carriage free to London, and extra plants presented with orders of 40*s.* and upwards. Descriptive Catalogues supplied for 4 postage stamps for postage.

COUNTRY SHOWS.—Monday, June 10: Bath Horticultural.—Tuesday, June 11: Oxfordshire Horticultural.—Wednesday, June 12: Durham Horticultural, Leamington Spa Horticultural, and Warwickshire Horticultural.—Thursday, June 13: Guildford Horticultural.—Friday, June 14: Berkshire Horticultural.—Saturday, June 15: Scottish Pansy.

SOME readers of the *Chronicle* are no doubt aware that M. BOUSSINGAULT, the distinguished French writer upon rural economy, proposed, some years ago, a method of determining what amount of HEAT a plant requires, in order to be enabled to perform the functions allotted to it by Nature. This method consisted in determining the length of time over which a function extends, and also the mean temperature during that period. Thus, if a given plant requires 20 days to ripen its seeds after flowering, and the mean temperature during that time was 10°, it would be assumed that the plant in question requires 200° of heat to complete the ripening process. Or if the period occupied was 10 days, and the mean heat 10°, then only 100° of heat would be required, and so on.

M. BOUSSINGAULT'S method was a great improvement upon the previous modes of computation. Observers had been previously contented with annual or quarterly, or other long means of temperature, as furnishing the elements required to determine whether a given plant could be advantageously cultivated in a given country. But these means were all more or less fallacious, and not only led to little practical application, but sometimes led to serious practical mistakes.

Mean temperatures are useless to cultivators unless they represent what takes place during the period of vegetation. We do not want to know what the temperature is of seasons when, or of places where, plants do not grow, unless for the purpose of determining the amount of winter protection which they may require; and all indications of climate in which the dormant season is mixed with the growing season only mislead. Suppose, for example, it was to be said that the mean annual temperatures of Longville and Bretville are the same (say 35°), this would be no proof of similarity of climate, for Longville might have the winter mean 20°, the summer mean 50°; while Bretville might have the winter mean 30°, and the summer mean 40°—cold winters and temperate summers characterising one place, mild winters and bad summers characterising the other. Nor are daily means much more useful. Let us suppose that Longville has in June a daily mean of 45°, while that of Bretville is 50°; it might be that these means represented hot days and cold nights in the one case, and cool days and mild nights in the other—conditions which for the purposes of cultivation are wholly different. So again when the temperature of soil is assumed to be shown by that of springs; in such cases the indications are fallacious; for as springs do not take their rise in places where vegetation is active, so neither do they represent the temperature to which the roots of plants are exposed. We want to know the daily, or at least the monthly temperature of that part of the earth in which the roots of plants are placed, not that of deep places in which no roots are found.

That M. BOUSSINGAULT'S method of explaining the relation between plants and climate was an important improvement upon the usual indications is not to be denied. But it was not wholly satisfactory. Pushed to its limits the theory was manifestly untenable, for it amounted to this—that if a plant requires 20 days with 10° of heat in each day, or 200° to do a certain thing, and if it can do the same thing in 10 days with 20° of heat in each day, then it ought to accomplish the same end in one day by the aid of 200° of heat, which is absurd.

The subject has been lately taken up by Prof. ALPHONSE DE CANDOLLE, in an able essay, from which we venture to make a few extracts. The learned and ingenious author wholly objects to thermometrical observations, as representing truly the heat to which plants are exposed. "Plants," he says, "are almost always placed in the sun, and all the thermometrical observations from which the temperature of a country is deduced, are made in the shade. We also know that the heat of the solar rays is different according to season, geographical position, height above the sea, and various local causes. Consequently 10° of mean temperature in the shade, for 10 days, will correspond, in one place, with a certain effect on plants exposed to sunshine, and in another place, or at another season, to a greater or less effect." "Philosophers," he goes on to remark, "who have desired to determine the amount of solar heat, have always used thermometers exposed at the same moment, or successively, to shade and sunshine. The differences are always great, and connected with season and geographical position; but such differences also depend much upon the nature of the thermometer, and on the way in which the bulb receives the solar rays during the day, or radiates at night. Sometimes the bulb has been covered with black wool, a substance possessing great absorbing and radiating power. Sometimes the bulb is naked. One class of observers guard it from the action of rain and dew; others leave it exposed to these causes of cooling. The series of observations in the Garden of the Horticultural Society of London has been made with thermometers covered with black wool—one in the shade, another in the sun—compared with a common thermometer in the shade. M. DE GASPARIN, wishing that his thermometers should be placed in the same position as plants, or at least the uppermost roots of plants, covered their bulbs with a millimeter of earth.

"It appears to me useless to discuss which of these thermometrical contrivances is the best. I regard them as all bad when applied to vegetable life. No one, indeed, can suppose that the surfaces of branches or of leaves are heated by the sun, or cooled by radiation, in the same way as this or that thermometer. We have to deal with solid bodies into which heat penetrates slowly, and we compare them to liquid mercury where the molecules shift their place as they are heated. We have to deal with green surfaces, mixed more or less with brown, yellow, &c., and we compare them with surfaces of one uniform colour, sometimes very different from green. The shining surface of a leaf reflects a part of the light, and we compare it with the round bulb of a glass thermometer, or with black wool; neither of which will reflect a single luminous ray. In a plant the cold of night does not force back the leaves or flowers which are formed during the day; alternations destroy nothing; and yet we compare a plant to a thermometer, in which the retreat of the mercury is calculated by subtracting the amount of its previous rise. Finally all physiologists know that the chemical part of the solar rays has an immense influence upon vegetable tissue, for it is this (independently of heat) which causes carbonic acid to be decomposed, and much water to be evaporated through the stomates. A luminous ray, almost devoid of heat, must certainly exercise its influence. It would, therefore, be useful to have a measure which shall determine at one and the same time both the heating and chemical action of the solar rays."

Hence M. ALPHONSE DE CANDOLLE contends that the only logical way of measuring the effect of solar rays upon vegetation is to observe plants themselves, "that is to say, to compare their growth; 1, in shade and in sunshine; 2, under different degrees of solar intensity, according to season and situation."

In what way he proposes to do this we shall explain on a future occasion.

TIME was when persons particularly distinguished for rascality were called "Rogues in Grain." It is now necessary to alter the designation; the title of ROGUES IN GUANO must henceforward be conferred on people characterised by cheating, lying, and all imaginable dishonesty. The extent to which the public is now being plundered would be incredible, if it were not notorious that fraud can find any amount of folly on which to operate. We boast of the advance of intelligence, of the progress of knowledge, of the mighty changes produced by education, and yet we yearly witness worse cases than ever of gigantic swindling on the one hand, and still more prodigious credulity on the other.

According to the Parliamentary return, published in our columns (p. 314), it appears that the total quantity of Peruvian guano imported in 1849 was 73,567 tons. Is any one simple enough to suppose that this represents the amount sold in London, Liverpool, and Bristol? Why, there cannot be a doubt that the deliveries by the guano dealers—of course we do not mean the importers—are at least 200,000 tons; probably much greater. There is now before us a list of 10 houses, *in London alone*, engaged in the adulteration of this substance. One of the agents employed by one of these houses contracts for the delivery of 30 tons of mere loam per week, and thus sends about 15,000*l.* worth of fraud annually into the guano market. But as mere loam

will not sell as guano, but requires to be flavoured, so as to deceive the country buyers, it is probable that this contract really represents at least 60,000*l.*; and if we only suppose each of the ten London houses to have dealings to the same extent, we have from London alone above half a million's worth of adulteration disposed of annually. In other words, the landed interest is fleeced to this extent by the frauds practised in the metropolis alone.

This may sound like exaggeration, but we believe it to be near the truth. Indeed the large expenses, the ingenious and costly expedients which the Rogues in Guano are driven to, in order to procure genuine guano with which to flavour their stuff, sufficiently show the magnitude of their operations. The importers not choosing to supply them directly they are driven abroad in search of it: and cargoes sent out in good faith to Holland, Belgium, and France, are actually repurchased in the foreign ports on English account, and reimported for the purposes of adulteration. In addition to this, all sorts of devices are employed to obtain guano here, ostensibly for one party but in reality for another. An example may serve to explain the system. It is not more than six weeks ago that one of the most respectable merchants on our Corn Market was asked by a correspondent at Amsterdam to purchase a cargo of guano for exportation. He did so, fully believing the representation made to him to be true. But the London dealers contrived to obtain possession of the order for the delivery of the guano, and would have smuggled it into one of their mixing places, had not an accident disclosed their intention and put an end to the scheme, after a good part of the cargo had actually been put on board their receiving ship. Men would never play a game of this sort if the stakes were not high, and the chances of winning all in their favour.

One may wonder how, in the face of such facts, the trade in adulteration thrives so much. But it is to be remembered that these doings are not known in the country, that the guano mixers are among the foremost in expressing their horror of such practices, and that the small buyers are far more remarkable for simplicity than for quick-sightedness. The simplicity of the class of small buyers is indeed beyond belief. We could lay our hands upon a district, not a thousand miles from Birmingham, where guano, mixed with 30 per cent. of plaster of Paris, actually sells for a better price than genuine guano, *because it looks nicer!* There is a story of a gentlewoman who declared that she quite enjoyed the neighbourhood of a dunghill—because it smelt of high rents; but that the value of manure should be estimated by the niceness of its look was a discovery reserved for our enlightened age. This is probably one reason why the trade in guano-mixing thrives so hugely,—guano looks so much better when mixed with loam, and gas-lime, and plaster of Paris, and ochre, than in its unadulterated condition.

Surely this is a most serious state of things. Surely it is a matter of very grave national concern that between scoundrels on the one hand, and dupes on the other, the land of England should be unable to produce the crops which it is capable of yielding. For ourselves we regard the guano question as one the importance of which is very insufficiently understood. Country gentlemen should consider that it is to them that cultivators look for advice, and guidance, and aid, in a case like this. The limited means of gardeners and farmers,—nay, we will add, in hundreds of cases their limited perceptions—render them unable to contend with so great an evil as the guano fraud. It is to their landlords, or masters, as the case may be, that they naturally turn for PROTECTION; and that protection they may fairly claim. What the small people—and they are the sufferers—cannot do, the great people may do for them, and effectually. One thing we would suggest is that the assistance of middle-men should in this matter be dispensed with as far as possible; and that guano be bought in the docks from the ships that bring it. It is understood that the importers deliver quantities as small as 30 or 40 tons. For this purpose gentlemen would have only to notify to their tenantry that as soon as such a quantity is subscribed for they will purchase it of the importers and cause it to be sent to the nearest market town, where the subscribers can each receive their quota without any addition to the first cost beyond the expenses of transit; and the middle-man's trade is gone. None but fools or lunatics would in such a case think of obtaining guano otherwise than from the local centres here proposed; for in the first place it would be cheaper, and in the next place its purity would be beyond suspicion.

If this suggestion were but carried out the trade [illegible]tion would fall to pieces; or it would be in adultera[illegible]e sole benefit of the foreigner, who, carried on for t[illegible] already under considerable it must be owned, obligations to the "Rogues in Guano." And we will take leave to submit that such a policy would be of more real public advantage than idle hustings speeches, or dreary parliamentary harangues, or even than abusing Sir ROBERT PEEL.

THE MARKET GARDENS ROUND LONDON.

By JAMES CUTHILL, Florist, Camberwell.

COVENT-GARDEN, the head market of this great metropolis, has long been celebrated for the finest fruits, vegetables, and flowers in the world, being different now from the time when the poor German gardener settled on a piece of land near the Monster public-house, Chelsea, on the lands of the Westminster family. This man bought dung where he could find it, and put it on his ground. The landlord brought an action against him; "but," says the landlord, "as you are an industrious man, I shall forgive you if you will promise me never to poison my land any more, by putting such filthy stuff on it." The market gardeners round London from time to time have been stimulated by receiving large prices for their articles, from living in the vicinity of such wealth. It being the head-quarters of the government of this mighty empire of a hundred millions of people, can it be doubted that the most extravagant prices could be obtained in Covent-garden market? For dung the carter is allowed 2*s.* 6*d.* for a single load, and for waggons 5*s.* I have known many coachmen in the Mews at the west end, that were obliged to give those carters 6*d.*, 9*d.*, and 1*s.* to clear the manure away. These men have long hours; but between wages, which are from 15*s.* to 20*s.* weekly, and the buying of manure, their wages sometimes reach 30*s.* per week. A country person will hardly believe me when I tell him that nine cart and waggon loads of vegetables have been brought by one grower, the celebrated Messrs. Fitch, of Fulham, off their 100 acres of land, and all sold in Covent-garden by Mr. Fitch by 9 o'clock in the same morning. Those men once sent in a four-horse waggon of scarlet Ten-weeks Stock, all pulled up by the roots, and in full bloom; they were sold by 7 o'clock in the morning, and fetched 30*l.*; but it did not pay the expenses, and was discontinued another year.

Sixty pounds have been obtained for an acre of Cabbages, and upwards of 100*l.* for an acre of Rhubarb, and more for Asparagus, 140*l.* for an acre of white Cos Lettuce, 150*l.* for an acre of Strawberries, &c. I have myself taken 30*l.* for 15 rods of ground of early Potatoes in the open ground, managed as I have directed in my pamphlet; 10*s.* for a Cucumber, and 20*s.* for a Melon, 2*s.* an ounce for forced Strawberries, and 25*s.* for forced Grapes per pound. I have also taken 6*s.* a pound for early Strawberries, in the open ground, upon early borders. The above prices seem high, but the expenses are enormous. Mr. Fitch, of Fulham, has told me that his 100 acres have some years cost him, everything included, very nearly 4000*l.* The above prices cannot any longer be maintained; an immense change has taken place since free trade and railroads have been introduced.

The change is fearful upon the old market gardeners—they cannot understand it. They little think how many fresh market gardens have sprung up in all directions, and along the lines of railways—land at 30*s.* an acre instead of 10*l.*, labour low, railway carriage cheap, and everything else in proportion. And again, all those families that used to consume the London grown article, now have their own garden produce sent by railway. They little think, also, that railways and steamboats are continually emptying London on the Sundays, and all other times, by the tens of thousands, to eat the fruits and vegetables of country gardens. That was not the case a few years back. However hard it may be for those near London who are high rented and most severely taxed, yet it is a great and decided change for the general benefit of mankind. Railroads have given one great advantage in the early spring to the London growers. Having the climate in their favour, they send a great deal of their vegetables northwards—as early Potatoes, Peas, French Beans, Cauliflowers, Rhubarb, Melons, Cucumbers, and other finer sorts of fruits and vegetables. The foreign articles do not hurt our markets in the vegetable line, because being grown in a warmer climate, they come in long before we do, and by the time our early Potatoes, Cauliflowers, Peas, French Beans, &c., are in, the foreigners' early crop is over, or at least it would not pay them to contend against us, unless in Cucumbers, and they are bad. As for Dutch Melons, no one of refined taste will eat them. The foreign growers have hurt our fruit trade to an immense degree—such as Apples, Pears, Plums, Cherries, Apricots, &c. As for Dutch Grapes, they look beautiful, but are tough, and three seasons out of four tasteless. The middle classes in and round London cannot afford themselves Strawberries more than a few times, and that only when a great crop is in full bearing. When a pottle is sold by the cultivators at 6*d.*, the weight of which is three-quarters of a pound, the grower gets only 3*d.*, and after paying ¾*d.* for the pottle, and 10*l.* an acre, with all other expenses, the Strawberry grower is but poorly paid. Much more could be said about the market gardening of London, but the conclusion we must come to is, that it consists in continual dunging, trenching, digging, sowing, hoeing, planting, taking the produce to market, bringing home money and dung, paying for labour, taxes, and breakage. I shall not disregard skill altogether, but dung is the very fountain-head—it is the gold in a half-formed state; and from the immense profits returned, it stimulates to the use of still more manure, till at last the ground is almost a hotbed. The crops are no sooner planted than they find their food at once, and their growth is rapid and fine. This will explain why a London gardener can get up acres of Turnips where farmers fail. Rotation, no doubt, is good in all crops where the land is poor, but as I have grown Potatoes these ten years upon the same ground, and every year the crop increases, I for one care little about rotation.

The market gardeners of London could bring the early produce in much sooner by forming beds, the perpendicular part facing the north, the bed sloping to the south, as I have practised myself years ago in a stiff soil, and light, too; and with the protection of glass over these beds, as recommended in the *Gardeners' Chronicle* for Peaches, Apricots, and Nectarines, they might almost bid defiance to the foreign grower. With the assistance of glass and the slopes together, they would certainly be equal to the gardens round Paris. Without protection of glass we can prolong fruits and vegetables out of doors without any loss, but what is most wanted is early fruits and vegetables at a cheap rate, which can only be effected by some cheap process such as has been recommended above. I am about to publish a pamphlet on 12 of the leading and most useful plants and vegetables. I have proposed an entirely new plan of growing Asparagus and Seakale, and if carried out properly, the million will partake of those most delicious vegetables which at present they never taste. *Abridged from the Maidstone Journal.*

DISEASES OF PLANTS.

(*Continued from p.* 341.)

GENUS I. BLIGHT [*Nebbia*].—I thus designate that disease of plants which shows itself by spots in the first instance of a pale and dead colour, but which subsequently become reddish, or sometimes yellow or black, or of other colours, but generally dark. They usually cover the surface of the plant, but sometimes also they attack the internal substance. Sometimes, after the appearance of the spots, there may be seen on them an exudation, either dense and even or powdery. The appearances vary also according to the part of the plant affected. Thence we may distinguish several species.

First species. EXTERNAL BLIGHT.—The external parts of plants, whether green or variously coloured, are liable to be suddenly covered with larger or smaller spots, and in greater quantities under one aspect than on the other side. These spots first appear of a pallid hue if on a green surface, or of a whitish colour where the organs are variously tinted; they then rapidly pass to a darker shade, and, as I have observed, differing according to the species of plant. Sometimes the evil stops at these symptoms, and then it is of little consequence, but only too often the leaves attacked shrivel and die. He who is aware of the importance of leaves in the vegetable economy, will understand the injury this blight inflicts on trees, preventing the buds from attaining the necessary perfection. It is well known that leaves thus spotted are most injurious if given to cattle as food. Sometimes the stalks also are spotted; and Beans and other leguminous plants often afford sad instances, where they become quite black, and it is useless gathering their seeds. For the most part this disease declares itself in spring; at that season when, after a slight rain, the sun bursts out at intervals, it strikes the plants with its ardent rays, and the spots appear. The same thing happens when at that season or in summer a fog arises through which the sun bursts forth. On that account this disease has been designated as solar spots; but, correcting what I have said in my essay on Nosology, I have thought it better to designate it, with all our agriculturists, by the name of blight (nebbia). On Mulberry trees it shows itself in the form of purplish spots, which, if given to silkworms, causes their death. The spots of the Elm and of several other plants are of a rusty colour, whilst those of the Vine are red. The epidermis of fruits becomes variously spotted. I have observed that pericarps or seeds which are white have reddish spots, and in general others have them dark, or brownish. Fruits are never equally covered with them, but more on one side than on the other. In leaves their colour is darker on the upper than on the under side. In some years the spots are smaller, but more numerous than in others. It appears to me that amongst trees, those whose leaves are the most delicate are the most subject to them. In shady places trees are rarely exempt from some traces of this external blight. Among herbs, those in gardens are the most affected.

Second species. INTERNAL BLIGHT.—Sometimes neither the leaves of plants, the flowers, nor any other external parts, give any visible sign of blight; but if the fruits are opened it will be observed that those, for instance, which have a fleshy pericarp, are full either of small dots or of blackish or yellowish spots, which corrupt the whole pulp and render it insupportable to the palate. The seeds, also, may be full of black dots in their farinose substance. The same occurs in edible roots, especially when cultivated in gardens; as also in leguminous seeds, which often turn out to be most afflicted by them when the general appearance of the plants is the finest. I have observed in the case of these seeds, that when fresh shelled they have a greenish white spot, from whence exudes a fluid which indurates as the seed dries. Unfortunately, we in some years find many fruits also thus affected; amongst those of our country, this internal blight is most

frequent in Pears, Apples, and more especially in Figs of the first crop; those of the second crop are mostly subject to it externally. Oranges, when blighted, have no juice, but are full of a substance resembling *semolina*. Beans, amongst leguminous plants, Wheat, Maize, Barley, Rye, Oats, and many wild Gramineæ, are subject to this disease, which, however, is less common in Wheat than in other grains. Those growing along ditches, or which have little access to air and light, or are in very watery places, are particularly liable, if proper attention is not paid.

Third species. YELLOW BLIGHT.—This disease is common to many plants, and is very nearly allied to the first species. In spring it attacks more especially all kinds of corn; but, as far as I have seen, does no great damage. The leaves, in the height of their vegetation, are observed to assume gradually a whitish green tinge, in spots of a long shape, which by degrees become yellow, but do not pass that stage; they do not turn brown, nor are they covered by any extraneous matter on their surface. I have often observed them, in years when vegetation has commenced with great vigour, and has then become languishing in May, on account of the abundance of wet, the disease is more frequent. I have never observed it on trees, and very rarely on any herb not gramineous.

Fourth species. MELUME BLIGHT. — Under this name of *melume*, I understand a disease which not unfrequently occurs among corn, especially in Wheat, and known in Lombardy under the name of *fumana*. The grain is covered with spots, as in the preceding species; but, besides that, amongst the chaff which incloses the grain there appears a yellow glutinous and fœtid powder. If rain comes to wash it away, it has no prejudicial effect on the grain, but otherwise it suffers considerably, and often remains ill-nourished and of bad quality. In the province of Reggio, where I have had the best opportunity of observing, it is seldom that it does not appear more or less, precisely when the ear has been fecundated. The substance in question has a vesicular and spotty appearance. It may also be found in the axillæ of the leaves and about their sheaths. This and the preceding species may afflict the plant at one and the same time, and be likewise accompanied by one of the sorts of rust.

VILLA AND SUBURBAN GARDENING.

THE following materials are essential to the successful cultivation of plants in pots, and should be kept always within reach of the potting bench, in a condition fit for immediate use. It is this foresight which has rendered the course easy to many a successful aspirant; the want of it is, and has been, the ruin of half the plants propagated in this country. The foundation of all cultivation depends upon having loam, peat, sand, and decayed manure at all times in proper condition. Loam, to be in condition for potting, requires to be laid up in a heap for at least 8 or 10 months, in order that its vegetable fibre may be in a state of decomposition. The best of all loams is that procured from very old pastures or commons. The surface should be pared off not more than 2 inches in thickness. This should be of medium texture, neither too stiff nor too much inclining to sand. Where convenience admits of having two kinds, a heavier and a lighter soil will be found of great advantage in pot culture, as they will tend to accommodate plants of different habits. Peat, suited for plants, is difficult to obtain in some localities. Wimbledon Common affords an abundant variety for selection. In choosing it, let it always be procured from a dry rather than from a wet, boggy, spongy situation; and, if it is covered with Fern or Heath, it will be necessary to stack it for some time previous to its being used, in order that the coarse roots and heathy matter may be easily broken up. This is a very essential and important item in the compost, as it tends to keep it open, and it also assists in promoting good drainage. Manure in a reduced state, perfectly sweet, should also always be kept in store for general purposes; stable dung, kept until it is quite rotten, is perhaps as good as anything. If possible to prevent it, it should never be allowed to undergo violent fermentation. For some kinds of plants, cow-dung, three or four years old, will prove very useful. Sand of a pure white kind is the most desirable; the nearer it approaches pounded silica the better. Few localities furnish this; and hence large quantities are continually being sent from the neighbourhood of London to plant cultivators in the country. To attempt anything beyond mediocrity, without being possessed of the above materials, will be found to be a waste of labour; for although success may occasionally be obtained in indifferent soil, it will after all be but a mere exception, and must not be taken as a proof that plants will grow and thrive in any compost, however carefully attended to, unless some attention is paid to their natural wants and habits; and, further, it should always be recollected that plants in pots are in an artificial position, and that they require a proportionate amount of care in their cultivation. *Pharo.*

Home Correspondence.

Distribution of Sewage.—Permit me to add some details to the hints contained in a leader last week. In the south of France a compartment of a garden being ready to be formed into beds and channels for irrigation, the gardener takes up with the aissade a charge of earth lengthways from the intended transverse channel, and with a sideway jerk of the tool scatters the earth over the intended bed; he then takes a step backward, repeats the same operations, and so on till he attains the place of the intended main channel. Gardeners become so very dexterous in this business that no line is needed for marking out the transverse beds; yet they are all made straight and of uniform breadth. By slight pressure of the aissade on the ground it is sufficiently hardened for the channel, and any loose mould that may have remained in the first aissade-length of channel is taken up with the second charge of the tool. When all the transverse beds and channels have been formed, a line is used to mark out the main channel, which is then formed in the same way that the transverse channels had been made, excepting that the earth taken out of it is used to form the dams across it. If it should happen that earth falls into a channel, or that any part of it allows water to sink in too rapidly, the gardener when watering remedies the defect by drawing the aissade along the faulty channel. No English garden tool could well supply the place of the aissade, but the manner of using it being so different from what English gardeners are accustomed to, they might perhaps be discouraged on first trial of it, but a little practice and perseverance would doubtless bring it into favour. In some few gardens where water has to traverse a very great length, as also sometimes for crossing footpaths, half pipes of common pottery are used; they are about a yard long, from 3 to 6 inches diameter, are bedded in the ground end to end, and common puddling at the joints suffices to make them water-tight. I can quite confirm what is said in the *Chronicle* as to the number of hands employed in such gardens. I knew a similar one in the south of France. The whole garden was irrigated twice a week in hot weather, that is for three or four months of summer; but there was another time-consuming and fatiguing business of the men—they carried on their heads a load to market a mile off every day; the garden produce was arranged in baskets on a board 5 or 6 feet long, which they balanced on their heads (the gardener himself, that is, and his man); the gardener's wife also carried a load in a basket. The boys were 10 and 12 years old; they had their schooling in the winter. The gardener's wife, aided by the weeding women, every afternoon washed and packed what was to be taken to market the next morning. Market gardeners about Montpellier are a most laborious set; they are well fed, well clothed, well lodged, most of them have clean linen every day, and those I saw had every part of their summer dress washed once a week. *B.*

Plumbago Larpentæ has proved hardy here. I saw a plant this morning growing very freely in the garden of Mr. Bunting, a nurseryman. It was planted out last spring. *Thos. Taylor, Colchester Hospital, June* 4.

Amaryllis Acramanii.—This beautiful Amaryllis has a bulb very large and round, with rather a long neck. The leaves are pale green, revolute, and tapering to a point; scape two or more flowered, pale glaucous green; flowers very large and spreading; petals long, broad, acuminate, and slightly undulated; deep green at the base, becoming nearly white to about one-half their length, and from the middle to the point of each, of a very fine deep rich scarlet, beautifully lined and reticulated with deep crimson, extending over the whole except the central stripes, which are white and broad; the sides of the base of each petal are richly marked with deep brownish purple. The stamens are about one-third their length green, the remainder fine bright red; the pistil is similarly coloured. The anthers before bursting are of a rich purple; farina yellow. This magnificent hybrid was raised in 1835 between A. aulica platypetala, and A. psittacina, and flowered March 22d, 1839. The above is a copy of the original description of A. Acramanii, which I made at the time of its first flowering. It was named in honour of Mr. E. Acraman, a gentleman of this city. The origin of A. Acramanii pulcherrima, which was shown at the last Chiswick fête, differs from that of A. Acramanii in being a cross between A. aulica and A. Johnsoni, but we were induced to give it that name in consequence of its resemblance to the original A. Acramanii in the size and form of its flowers; but its colours are far more beautiful; indeed, amongst the number of varieties of this truly magnificent tribe which I have had the good fortune to raise, none have yet equalled the one in question in brilliancy of colour and general good qualities. *James Garaway and Co., Bristol.*

Flued Peach Walls (see p. 293).—Why are flued walls not more generally worked in spring, with a view to keep off frost? The wall formerly mentioned by me was built 28 years ago, and has been worked every year, the first fires being applied in autumn to ripen the wood. Fires are again lighted in spring as soon as the buds begin to expand, which is generally about the first week in March, and they are continued until about the middle of May. An Elruge Nectarine, 28 years old, and covering a space of 14 feet (the height of the wall) by 16 in breadth, has a beautiful crop of fruit on it, some of them, on the 20th of May, measuring 4 inches round. A Peach tree, 20 years of age, 14 feet by 20, had 230 fruit taken off it at the first thinning on the 20th of May. Some of the fruit left measured 4½ inches in circumference. The gardener states that he generally gathers ripe fruit from the lower part of the wall in the first week in August, and that he continues to have plenty through the greater part of September. If this can be done in the centre of Fifeshire, can it not be effected elsewhere? And if it can, is it necessary for gardeners to put their employers to the expense (where flued walls already exist) of erecting glass houses on the principle recommended by Mr. Fleming and others for growing Peaches out of doors? and if they were put up, would it be safe to trust Peach trees in full bloom to 10 or 12 degrees of frost? As to the protection recommended for the sides of such houses, no one can put much faith in it; if such protection was sufficient, "Pharo" would not have to state (see p. 325) "that whole walls of Peaches are already numbered with the things that were." I may mention that the situation of the garden to which I allude is low and naturally damp, and that it is seldom necessary to light fires in autumn to ripen the wood, as it is generally thoroughly ripened by solar heat. *A Peach Admirer.*

Hartley's Patent Rough Plate Glass.—I have for nearly two years been trying rather extensively Hartley's patent rolled glass, and have watched with considerable interest the various accounts of its successful application which have been noticed in the *Chronicle*. I am satisfied that it only requires to be generally known to be universally adopted in preference to any other kind of glass. I have used squares 48 inches long by 18 inches wide, and find that from the smaller quantity of wood required, the great diminution of labour in making, painting, and glazing, that there is an actual saving in price of nearly 25 per cent., as compared with a house covered with ordinary crown or sheet glass. Its practical advantages are, however, the most important. The plants being protected from the injurious evaporation of the direct rays of a scorching sun, require one-third less watering; their foliage is of a much deeper and healthier hue, and it has that peculiar crispness to the touch indicative of a most perfect state of health. I find that under it plants are scarcely drawn at all; in fact, not more than if planted in the open ground, and although their flowering is retarded seven or ten days, yet the bloom lasts so much longer in a better state of preservation as to more than counterbalance this little objection. For Camellias and other plants whose leaves are liable to burn it is invaluable. One strong objection used against it was that during the winter months it would lessen the light to a serious extent. I have paid particular attention to this, but do not find it exist; similar to ground glass the light is universally diffused all over the house; and although the southern side of a plant may not receive so strong a ray, yet the majority of the leaves receive a much larger portion of light. I have used about 2000 feet of it, chiefly in a span-roofed house 70 feet long; and I am so much satisfied with it that I contemplate fitting up a house 40 feet by 30 for specimen plants. In all my pits it is used only on the south side; the only objection I have to it is the appearance outside, which is certainly far from pleasing, but this is of very minor importance. *W. Wailes, Newcastle-upon-Tyne.*

Gravel Walks.—In a new gravel road which I have had constructed down a gentle declivity, with the surface below the adjacent turf, I have been annoyed by the gravel having been washed down along the depressions on the two sides. Taking your advice, I have had the turf taken up, a quantity of the under soil removed, and the turf relaid so as to leave the road higher than the turf. The cure is complete. The showers, instead of forming gutters in the road, pass off to the turf without causing the slightest injury to the gravel. *Sigma.*

Country Curate's Garden.—If I were to advise on this subject, I should say, "keep a cow" instead of bees, and plant the garden chiefly with Mangold Wurzel. There is often enough Grass by the road sides to keep a cow during the summer, if there is a place to turn in at night, and the Mangold Wurzel will provide for her in winter. I do not think anything else would be so profitable. *F. J. Graham, Cranford.*

Rose Stocks.—The cause of my failure with the crimson Boursault was not occasioned by "working on Boursault stocks raised from thick sappy, instead of small hard, cuttings." The cuttings were selected with extreme care from small, hard, well-ripened wood. Sappy cuttings on removal from the cutting bed will be found to be more or less decayed; indeed a large portion of them will not be fit to plant out. Few therefore would think of putting out such cuttings a second time. I alluded to its liability to decay (when grown from small hard cuttings), under favourable circumstances. To explain myself more fully: The crimson Boursault partakes more of the habit of a Raspberry stool than anything else to which I can compare it—in trying to renew itself annually by strong succulent shoots from the root. True, there is this difference, that the Raspberry canes die down annually, whilst old shoots of the Boursault will last for some years. When this Rose is cultivated for the beauty of its flowers, the old shoots should be annually well thinned out, laying in their places well-ripened young wood, which will bloom finely; if the old shoots are suffered to remain, small foliage and wretched flowers will be the result. Let us suppose a strong Bourbon to be worked upon this stock. For the first year or two it will grow and bloom finely. During this time Nature strives hard to regain her place; strong thick suckers will be sent up in abundance from the stock, below the point of union, and from the roots. These of course will be continually rubbed off, and on account of their succulent watery nature the stock will speedily commence decaying at the wounds made by their removal, and it will very soon perish. If this calamity is escaped, after a few years the plants become unhealthy, and eventually die; but had they been worked on stocks free from this stooling propensity—stocks that would send and continue to send a

more direct current of sap to the plant, a very different result would have been obtained. In order to explain the effects of this stock on small delicate Tea Roses, I shall take, for the purpose of illustration, the case of a Genista tinctoria flore-pleno worked upon a Laburnum. The Genista grows splendidly and flowers profusely the first season, forms most beautiful heads; but how long does this last? Alas! when the plants sink into repose in the autumn, many never awake again, and those that do linger on, die bit by bit and branch by branch, and ere a second autumn returns, they too are swept away. This is exactly the fate of delicate Teas worked upon such stocks. If I am asked the reason of all this, I reply that it is caused by the stock possessing an abundance of organisable matter which pushes the bud out vigorously the first season, but whilst this vigorous growth proceeds there is also a vigorous root action propelling into the small and delicate foliage abundance of crude matter, which it is impossible for such small and delicate organs to digest and assimilate—operations formerly performed by the large foliage of the stock; hence come sickness, decay, and death. "I happen," says "An Amateur," "to have living proofs in plants of these kinds (many of which trees are as many years old as the Manetti stock has been known in England)." Mr. Rivers states that he received the Manetti stock from Italy some 12 or 15 years ago. To what extent were Celine and crimson Boursault grown as stocks at that period? Many of the Roses named by "An Amateur" have been introduced since that time. "The finest Cloth of Gold and Devoniensis in the kingdom," says "An Amateur," "are on the Celine and crimson Boursault stocks." Why did he not say plainly that the Cloth of Gold to which he alludes, is worked upon Celine? which I have reason to know it is, and which is the stock I recommended for it on the authority of Mr. Rivers. When a cat shall be able to consume the same amount of food as a lion or a tiger; when a Shetland pony will be capable of eating and digesting the same amount as a dray-horse, and when a child will take the same quantity and quality of food as a man, then, and not till then, shall all the delicate Teas and Chinas have their nature changed by being worked upon Celine and crimson Boursault. *John Saul, Durdham Down Nursery, Bristol.*

——It is my conviction that the qualities of the Manetti stock are at present very much overrated. It has been grown here to some extent for many years; various experiments have been made with it, but it continues to sink in our estimation. I believe it is recommended chiefly on these grounds—1st, as a stock for the small and delicate growers on all soils; 2dly, as a stock for all kinds on light soils. To take the first point, my experience tells me that it is a bad stock for the delicate growers on good soils. It there forces an unnatural growth; the first growth from the bud is, I grant, of an astonishing vigour; but we should no more regard this as an index of health or longevity than the physician would the hectic glow on the cheek of a consumptive patient. The leaf falls; on the return of spring the growth is feeble, and the plant never recovers its pristine vigour. But the worst quality of this stock is its great excitability. The buds are developed so thickly and so rapidly that unless the plants are closely watched the stranger bud is soon starved; and hence it appears reasonable that Roses will prove shorter lived on this stock than on any other. It may be useful for the small and delicate growers on bad soils. It may also be useful for pot culture. In general it is a better stock for the free than the shy growers; but where do the former refuse to grow on the Dog-Rose or on their own roots? Then, as to soils; in light soils, as far as my observation serves, most kinds thrive better on their own roots than on any stock. The Manetti being comparatively new is but little known, and those who are fond of experimenting may do well to try it, but the present high estimation in which it is held will, I fear, cause no little disappointment. *William Paul, Nurseries, Cheshunt, Herts.*

Economical Application of Waste Steam.—I used it first to heat a tank, but I have lately put up a small Pine stove and a Melon pit, 18 feet each, upon Mr. Fleming's plan (who was kind enough to show me his), and I have introduced the steam into the boiler which heats the pipes, so that at nights, and other times when there is no steam, I have only to light a fire under the boiler and it works as a common hot-water apparatus, keeping the top heat at 75° and bottom heat at 85°, or more if required. When the steam is in action, the condensation not only keeps the apparatus quite full of water, but a large quantity runs to waste; and I shall be obliged by your informing me if this distilled water is suitable to water plants with; as if it is, I have a constant supply of warm water always at hand. *D. H., Bilston.* [Yes.]

Distribution of Sewage Water.—I should recommend your correspondent to try either ¾ or 1 inch gutta percha tubing, which is much cheaper than leather. I tried hemp hose, which would only last one season; and I have leather hose, but it requires a great deal of care and attention to keep it in order, and it has burst two or three times with the pressure from our water-works—about 200 feet—but the gutta percha which we tried last season requires no care or attention, for it is frequently left on the Grass or under the trees for a week or more at a time, when it is frequently used; and when it is put by, there is no occasion to do anything to it. The gutta percha tubing has never burst, and it appears quite as good as when it was first purchased. I should not recommend a larger sized tubing than 1 inch, and if ¾ would be of sufficient size it would be better for turning about. *B. M. Jalland, Holderness House, Hull.*

The Gardeners' Benevolent Institution.—Two highly respectable gardeners from Cheshire called upon me last week. They complained very much of the mode of electing pensioners for the above institution; they said there was no chance for a country gardener getting elected. I stated that that was not true. The majority of subscribers however being round London, no doubt most of the pensioners belong to its neighbourhood. I nevertheless altogether disapprove of the mode of electing the pensioners. My plan would simply be this—that no old gardener or widow be allowed their names on the books unless they are *eligible*, then the oldest on the list to be chosen at once. If this were the case, hundreds more would join the institution; I also object to clause 2, in rule 3, which says that "A market gardener cannot be eligible unless he has held 5 acres and been duly rated in the parish books for 20 years;" this no doubt excludes many persons. Again in clause 3 of the same rule, "All nurserymen and seedsmen must be rated in the parish books for 20 years;" this excludes myself and many others, and if the above objections are not immediately removed, I for one must withdraw my name. *The Originator of the Institution.*

Transmutation of Species.—To some of the readers of the *Gardeners' Chronicle*, who may feel interested in this marvellous doctrine, the following remarks will probably be acceptable. They are taken from a little work, by Professor Whewell, entitled "Indications of the Creator," and evidently designed as a reply to the startling views propounded some years ago in "Vestiges of the Natural History of Creation." To the questions, "In what manner do species which were not, begin to be?" and "How we are to recognise the species which were originally created distinct?" Dr. Whewell observes, "the most remarkable point in the attempts to answer these and the like is the controversy between the advocates and opponents of the doctrine of the transmutation of species. This question is, even from its physiological import, one of great interest; and the interest is much enhanced by our geological researches, which again bring the question before us in a startling form, and on a gigantic scale. We shall, therefore, briefly state the point at issue. We see that animals and plants may, by the influence of breeding, and of external agents operating upon their constitution, be greatly modified, so as to give rise to varieties and races different from what before existed. How different, for instance, is one kind and breed of dog from another! The question then is, whether organised beings can by the mere working of external causes, pass from one type of one species to that of another? Whether the ourang-outang may, by the power of external circumstances be brought within the circle of the human species? And the dilemma in which we are placed is this: that if species are not thus interchangeable, we must suppose the fluctuations of which each species is capable, and which are apparently indefinite, to be bounded by rigorous limits; whereas, if we allow such a transmutation of species, we abandon that belief in the adaptation of the structure of every creature to its destined mode of being, which not only most persons would give up with repugnance, but which has constantly and irresistibly impressed itself on the minds of the best naturalists as the true view of the order of the world. The question of the limited or unlimited extent of the modifications of animals and plants has received full and careful consideration from eminent physiologists; and in their opinions we find an indisputable preponderance to that decision which rejects the transmutation of species, and which accepts the former side of the dilemma; namely, that the changes of which each species is susceptible, though difficult to define in words, are limited in fact. It may be considered, then, as determined by the overbalance of physiological authority, that there is a capacity in all species to accommodate themselves, to a certain extent, to a change of external circumstances; this extent varying greatly according to the species. There may thus arise changes of appearance or structure, and some of these changes are transmissible to the offspring; but the mutations thus superinduced are governed by constant laws, and confined within certain limits. Indefinite divergence from the original type is not possible, and the extreme limit of possible variation may usually be reached in a short period of time; in short, species have a real existence in nature, and a transmutation from one to another does not exist." *W. B. B.*

After-treatment of Potatoes cut down by Frost.—My Potatoes were all cut down by frost on the 10th of May; and when the leading shoots are destroyed, it is well known that the whole of the buds or eyes below, which under other conditions would not have grown, start into growth. The large quantity of shoots thus produced weakens and very much diminishes the crop. With a view to induce the leading shoots to grow as strongly as before, pull off all the small shoots which will separate freely, and allow only the strongest to remain. Large fields of Potatoes might be thus operated on by women and children, and it would be found that the result would pay for the extra labour. I have left several alternate rows unpulled, and the difference between them and the pulled rows is very visible, although they have only been denuded of their branches about a week. The plan might be practised in regard to small whole tubers, which throw up many stems. The pulled up shoots have good roots, and might be used for filling vacancies. I have planted a row of them. *James Cuthill, Camberwell.*

The Brown Scum on Water is, I believe, the incipient state of a common Conferva. I cannot send you the name, as I have no work in which it is figured. It consists of numerous catenate threads, which in time become felted together, and may often be seen after floods in the form of whitish-brown paper, adhering to boughs by the sides of rivers and pools. I send you a sketch of a fresh filament and a portion of the dry substance. It might have suggested the manufacture of paper, and is a beautiful object for the microscope. *F. J. Graham, Cranford.*

Societies.

LINNEAN, *June* 4.—The President in the chair. The Chairman nominated Dr. Horsfield, Dr. Wallich, Sir W. J. Hooker, and W. Yarrell, Esq., Vice-Presidents of the Society. A paper was read by Dr. Lankester, entitled "Notice of some Peculiar Bodies found on the Epidermal Tissue of Callitriche verna." These bodies are of a stellate form, and thickly stud the surface of the stems and leaves of the common species of Callitriche. They are generally composed of eight cells, one in the centre and seven around it. These bodies have a spheroidal form, and are connected with the tissue of the plant by a short thick pedicel. They are more numerous on the upper than under surface of the leaf, and are irregularly distributed over the whole plant, with the exception of the ovary and stamens. Dr. Lankester regarded these bodies as analogous to the hairs and scales which occur in the epidermis of plants growing in the air. He also alluded to the probability of their resembling the stellate bodies found in Victoria regia. The President thought these bodies were not analogous to those found in Victoria and other Nymphæaceæ. He also referred to the structure of the scales in Tillandsia and some other plants. Mr. Ralfs stated that the bodies described by Dr. Lankester closely resembled some he had observed on the leaves of Dionæa muscipula, and which he believed were stomates. Part of a paper was read from W. Bollaert, Esq., on the "Botany of the Texas."

BOTANIC, OF EDINBURGH, *May* 16.—The President in the chair. A communication on the Roots of Umbelliferous Plants, was announced from Dr. Hoffman, of Giessen. The following papers were read: 1. On Colchicum autumnale, by J. Maclagan, Esq. 2. On Dickieia, by J. Ralfs, Esq. The author, after describing the characters of the genus, showed how it differed from Schizonema, and then gave the characters of D. ulvoides (Berk. and Ralfs), and D. pinnata (Ralfs). Specimens of Dickieia ulvoides were shown under the microscope, to illustrate the paper. 3. On Arum maculatum, by J. Kay, Esq. The author sent specimens of the plant in various stages of its development. The object of his paper was to show that, judging from the venation and development of the spathe, it is to be considered as a modification of the lamina of the leaf, and not of the petiole, as some have supposed. A specimen of starch from the corms of the Arum was exhibited. Mr. Stark showed a mode of making cells for the microscope by cutting off thin slices of gutta percha tubes and fastening them on glass by means of gentle heat. He exhibited under the microscope several preparations of sea weeds put up in this manner. A note was read from Mr. C. E. Parker, Torquay, containing some observations on Narcissus biflorus. He stated that the corona of Narcissus biflorus does not acquire a white edge until the blossom is fully expanded, and in its prime. In its young condition, it is of the same colour as the rest. He likewise mentioned that the plant frequently occurs with one flower in the spathe. Mrs. Robertson, Stirling, sent a notice (accompanied by fresh specimens) of the discovery of Buxbaumia aphylla in large quantity on Ben Ledi. Fresh specimens of the Buxbaumia were likewise exhibited from Mr. Oglivie, Dundee, having been gathered by him on the Sidlaw Hills, along with Bæomyces roseus from the same place. Various garden plants were also exhibited.

ENTOMOLOGICAL, *May* 6.—J. F. STEPHENS, Esq., F.L.S., V.P., in the Chair. Mr. Stainton exhibited various species of Micro-lepidoptera, including nine species belonging to the genus Ornix, six of which were British, and one new to science, taken in Devonshire at the end of April, also specimens of Bedellia somnulentella, and of various species of Micropteryx. Mr. Shepherd also exhibited specimens of Lobophora polycomata (fem.), and of different species of Micropteryx, taken at Darenth Wood, Kent, in the preceding month, one of which was a singular coloured variety. The chairman also exhibited three new British species of moths, namely Stigmonota dorsalis, Fab., from Scotland, Depressaria capreolella, Zeller, from Darenth, and Tinea caprimulgella, Heyd., from the neighbourhood of London. Mr. S. S. Saunders exhibited a specimen of Andrena Trimmerana, in spirits, parasitically infested with a female Stylops, and read a supplemental paper on the latter insect. Mr. A. White exhibited and read the description of a remarkable Indian beetle, which he proposed to name generically, in honour of the late Mr. E. Doubleday, Doubledaya viator, allied to the g. Languria. Mr. Newman read the description of a new species of Panorpa, from Australia, being the first species of that genus hitherto described from that quarter of the globe; but Mr. Fortnum stated that he had captured several species of Panorpidæ, in South Australia, and that among them were at least two species of Panorpa, now in Mr. Hope's collection, presented to the University of Oxford. Mr.

Fortnum also exhibited a parasitic Gordius, which he had taken from a German specimen of Locusta biguttula, and also a parasitic dipterous larva from another locust. Mr. Douglas completed the reading of his memoir on Gelechia, enumerating 20 additional species. The President stated that the report of the committee appointed at the last meeting, to consider the prize Essays, sent in upon a genus of Tortricidæ, would be announced at the next meeting of the Society.

June 3. — G. R. Waterhouse, Esq., President, in the chair. The President announced that the Curatorship of the Society had become vacant, by the resignation of Mr. F. Smith (to whom a vote of thanks had been passed by the Council), and that the situation would be filled up at the next meeting. Mr. J. F. Stephens exhibited specimens of the true Chrysomela sanguinolenta of Linnæus, from the north of Scotland, the species known under that name in the English cabinets being distinct. Also specimens of the linear scale insect (Coccus linearis), which had destroyed several trees of Ribes sanguineum in his garden, and had now attacked the Apples and Almonds. Mr. Shepherd exhibited the rare Xylina conspicillaris from Darenth, and Mr. Bedell various micro-lepidoptera, including Depressaria assimilella reared from the tips of Broom shoots, and Tortrix strobilella, from Spruce Fir cones. Mr. Westwood exhibited specimens of both sexes of the very rare Lyda fasciata, reared from the larvæ, which feed in society on espalier Pear trees in his garden at Hammersmith. Also the curious cased larvæ of a species of moth of the genus Astyages, which are at the present time doing much injury to the foliage of Pear trees in the Horticultural Society's Garden at Chiswick. Mr. S. Saunders read the descriptions of several remarkable species of hymenoptera from Albania, and exhibited specimens illustrating the natural history of the little Crabronideous Rhopalum rufiventre, which burrows on Raspberry stems. Mr. Stainton exhibited the rare Lithocolletes tenella taken in plenty on the Hornbeam in Epping and Hainault forests, and Mr. S. Stevens specimens of Dryophilus anobioides and Hylurgus rhododactylus, which burrow in old Broom stumps. Also Fumea retiella, and a new British species of Dorytomus from Wimbledon Common. Mr. W. W. Saunders exhibited leaves of Rhododendron ponticum, gnawed in a remarkable manner by Otiorhynchus sulcatus; also some extremely interesting nests and cocoons from the banks of the river Amazon. Mr. F. Smith made some observations on the Pediculus melittæ of Kirby, and on the young larvæ of Meloe proscarabæus and violaceus and also exhibited three new British species of Nomada, Chrysis and Crabro, from the collection of Mr. Hewitson. Mr. Yarrell read a note on the entomological peculiarities of the island of Guernsey, and also stated the remarkable circumstance that he had lately noticed that the temperature of the canal near Stockbridge, in Hampshire, was at least one degree colder than that of the adjacent river, but that notwithstanding, the May flies are always developed in the canal several days earlier than in the river.

Worton Cottage, *May* 29. — Pansies. — "T T." several blooms of each, and well packed; 38, style of optimus, and a considerable improvement upon it, having more ground colour; 2, yellow ground, bronzy purple top petals, lower ones margined with same colour, bold eye, showing to great advantage: a fine flower for exhibition. Nos. 63, 43, 51, and 16, are no improvement on varieties already out. Cinerarias.—"D. J." 10 flowers. Striking, circular, and with broad obtuse petals, white ground, deep blue tip and moderate-sized disk; a useful flower. E. G. Henderson exhibited named varieties, Mrs. Sidney Herbert, Lady Hume Campbell, and Madame Sontag, which were handed to Mr. Andrews to figure. Seven seedlings of 1850 accompanied them, some of a very promising character; 20, too small at present, but fine in form, white ground tipped with rosy lilac; 10, has also a similar ground colour, with heavy edge of deep rosy lilac, good size and shape; 195, very bright blue, but not so good in form as is desirable; 12, reddish purple of some promise. Of 192 and 199, both rosy lilac flowers, the former has the most good points. The deep bright blue is too small, and too starry. Pelargoniums.—A selection of single flowers was exhibited by Mr. Hoyle, of Reading, several of them possessing very great merit in form and colour; these were arranged in a Pansy stand of 24, and a similar stand was filled from the Worton Cottage collection. Upon the merits and faults of both a very interesting conversation took place, evidencing the utility of these meetings. Mr. Stedman produced a two-year-old seedling of good habit, and a free bloomer, in colour reminding us of Foster's Sylph. Phloxes were received from Messrs. Garraway and Co., of Bristol. They consisted of four distinct varieties, in present, but not general cultivation; Oculata, white with purple eye; Jarrattii, lilac with white eye; Atropurpurea, crimson purple and dark eye; and Leopoldiana, now common. All are well worthy of cultivation. Cactus.—Mr. Hoyle presented a flower of a seedling Epyphyllum, form of speciosissimum, large and handsome. Mr. Beck's collection is now in full bloom, and makes a very fine display.

June 5. — Tulip: A bloom of Haward's Magnificent, figured in a "Florist" for 1848, was sent, in order to prove the fidelity of the drawing, which it did most satisfactorily. Calceolarias.—"C. J." sent a considerable number of single flowers, but they were all defective in form, too flat and too much indented. In colours, No. 12 is the most novel. "G. S:" the flowers forwarded under this signature were all go backs. "M. W.'s," on the contrary, were of an excellent class, one was selected for Mr. Andrews to take a coloured memorandum of. "W. W's." seedling, though pleasing, has no novelty in it. Fuchsias came from "E. B., Deal;" they were sadly bruised, but there appeared nothing novel, although possessing many points of excellence. Cinerarias.—"W. W." All these flowers were perfectly dry and withered; the one from "G. S." is a very pretty variety, clear white ground, with purple top and neat small disk, flower rather too small. Pelargoniums.—"H., Cornwall," three seedlings, too much bruised to speak of correctly, but evidencing much refinement and quality. "M. W.'s" is a bright flower, but it had fallen to pieces, as had all the fancy varieties from "W. H. S.;" the hot weather had occasioned this no doubt, for they were capitally packed. Primula sinensis.—Two plants from "M." were very good in colour for the time of year. No note accompanied them. — N.B. Two boxes from Deal cost 6*d*. "W. W.'s" Cinerarias 6*d*. The Censors protest against these charges.

Review.

Six Lectures on Astronomy. By George Biddell Airy, Astronomer Royal. 8vo, pp. 247. Simpkin and Marshall.

The subject of astronomy not falling within the legitimate scope of a journal devoted to horticulture, we should not perhaps have brought the present volume before our readers, had it not been for the peculiar circumstances under which Mr. Airy's lectures were delivered.

Our readers may remember that between two and three years ago, there was established at Ipswich a museum for the express object of giving facilities for the study of natural history by the lower classes. (See the *Gardeners' Chronicle* for 1848, p. 35.) It was not intended, however, that a knowledge of natural history alone should be brought within the reach of the uneducated and the poor; lectures on other scientific subjects were promised, and in pursuance of that promise the Astronomer Royal, in the month of March 1848, delivered a course of six lectures on astronomy. Those six lectures were taken down by short-hand writers at the time of their delivery, were afterwards revised by the lecturer, and have since been published by the directors of the Ipswich Museum, in the volume which is now before us.

Of the lectures themselves we need say nothing; the great reputation and well-known learning and ability of the lecturer were such as to ensure to his hearers an accurate and clear outline of the subject, with which he is so familiar. By the publication of these lectures, the directors of the museum have placed within the reach of those who had not the opportunity and advantage of being orally instructed, the best exposition that we have ever seen in any language of the great principles of the science of astronomy, and of the reasons on which our belief in them is founded. It is by such means as these that solid valuable information is best conveyed to the public; it is only by the publication of good elementary works, of works cheap enough to enable an industrious poor man to purchase them, and simple enough to enable a person of ordinary intelligence, but without any previous knowledge of the subjects of which they treat, thoroughly to understand them, that knowledge can be effectually diffused amongst the mass of English workmen. Had we more of such books as these we should no longer have people taking for granted everything a village schoolmaster may choose to say is true, we should no longer have men like the Astronomer Royal complaining of the first task imposed upon them of unteaching what has been taught; at present, however, it is necessary so to do, as the following extract from Mr. Airy's very first lecture shows.

"I dare say everybody here, like myself, has in his time studied books containing measures—so many Barleycorns make an inch, so many inches make a foot, so many feet make a yard, &c., as well as so many yards make a mile, and so many miles make a degree. But the publication in a book of measures of such an expression as '69 miles make a degree' is in the highest degree reprehensible, as giving false ideas on one of the most important expressions in science. No schoolmaster ought to introduce books into his school, teaching that 69 miles make a degree. What do we mean by a degree? The use of the word degree is to define inclination, and it ought to be looked upon as defining a measure of inclination only, and not a measure of length. If I had to describe the position of two arms of a pair of compasses, I should say they were inclined; but the notion of their inclination is entirely different from the notion of a measure of length. But we want some means for describing how much these two arms are inclined. Now the method of describing how much these two arms are inclined is got at in this way: we use the word *degree* for a certain small inclination, such that if we first give one arm an inclination of one degree to the other, then incline it one degree further, then one degree in addition, and so on to 360 degrees, the arm will have gone through a whole circle of inclination, and will have returned back again to its first position. But these degrees, you will perceive, have nothing to do with lineal measures; they are inclinations and nothing else; they have nothing more to do with lineal measures than they have to do with pounds weight or pounds sterling."

After the above clear definition of what a degree really means, we wonder how long the poor and uneducated, and the well educated too, will be told that 69 miles make a degree, that 90 degrees make a right angle, and be left to infer that a right angle consists of 6210 miles!

The present lectures, with others of the same class, should be placed in all the reading rooms, which are gradually being formed throughout the country, and let not gardeners and other students of natural history despise them as not bearing on their more immediate pursuits, for they will find, in Professor Airy's words, "that their subjects are so closely connected, the habits of thought which they induce and the mode of treating them are so similar in many respects, that what applies to the one will in a great degree apply to the other."

Miscellaneous.

Some Account of the Victoria Regia in its Native Waters.—"We at length reached the igarape, and were at once gratified by seeing the Victoria growing by the opposite shore of the igarape itself. We were warned by the people not to go amongst the plants, as their prickles were venomous; but I got both hands and feet considerably pricked without experiencing any ill effects. We were fortunate in finding the plant in good flower, but, according to the testimony of all at Santarem who have seen it, the leaves attain their greatest dimensions in the winter. Captain Hislop assures me he has seen many leaves 12 feet in diameter, whereas the largest we saw measured a very little above 4 feet across, and they were packed as close as they could lie. But I can easily conceive how, in the wet season, their dimensions should be considerably augmented, for whereas at present the plant is growing in less than 2 feet of water, in winter the igarape will be filled to its topmost banks, or at least 15 feet deeper than at present, while its breadth will also be greatly increased; so that the petioles of the Victoria, lengthening doubtless with the rise of the waters, will bring the leaves to a much greater surface, on which they will have room to dilate to about twice their present size. The aspect of the Victoria in its native waters is so new and extraordinary, that I am at a loss to what to compare it. The image is not a very poetical one, but assuredly the impression the plant gave me, when viewed from the bank above, was that of a number of tea-trays floating, with here and there a bouquet protruding between them; but when more closely viewed, the leaves excited the greatest admiration, from their immensity and perfect symmetry. A leaf turned up suggests some strange fabric of cast-iron, just taken out of the furnace; its colour, and the enormous ribs with which it is strengthened, increasing the similarity. I could find no prostrate trunk, as in the other Nymphæaceæ. The root is central, the thickness of a man's leg, penetrating deep into the mud (we could not dig to the bottom of it with our trésados), and sending out fascicles of whitish radicles, about 25, from below the base of each petiole, the thickness of a finger and 2 feet or more in length. The radicles are imperforate, and give out here and there a very few slender fibres. From the same root I have seen flowers uniting the characters of Victoria regia and cruziana (of the latter I have only the brief description in Walpers), so that I can hardly doubt their being the same species, as had been already more than suspected. The igarape, where we gathered the Victoria, is called Tapiruari. I had two flowers brought to me a few days afterwards from the adjacent lake, which seems to have no name but that of the sitios on its banks; Mr. Jeffreys has also brought me flowers from the Rio Arrapixuna, which runs into the Tabajoz above Santarem, and in the wet season unites the Tabajoz and Amazon. I have further information of its growing abundantly in a lake beyond the Rio Mayaca, which flows into the Amazon some miles below Santarem. Mr. Wallace, who recently visited Monte Alegre, had a leaf and flower brought to him there; I have seen a portion of the leaf, which he dried. Lastly, I have correct intelligence of its occurring in the Rio Trombetas near Obidos, and in lakes between the rivers Tabajoz and Madeira, so that there can be no doubt of its being plentifully distributed throughout the whole of this region, both north and south of the Amazon." *Mr. Spruce's Voyage up the Amazon, in Hooker's Journal of Botany.*

Damaging Ornamental Trees.—At *nisi prius* the proprietor of a villa at St. John's-wood lately brought an action of damages against a tenant who had lopped five trees of the Weeping Willow, Birch, Laburnum, and Acacia tribes, which stood between the villa and the high road, concealing the view between the two. The plaintiff estimated the deterioration of his property at 15*s*. a week on 3*l*., the whole amount of the rent, as the trees were of 20 years' growth, and so much injured that 12 or 14 years would scarcely restore them. On the other hand evidence was led to show that 3*l*. a week were still asked for the villa, and that the pruning had not deteriorated the value of the property,—a nurseryman declaring that in two or three years the trees will be handsomer than ever they had been. The jury awarded 30*l*. damages. *The Builder.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

In addition to the ordinary routine of watering, syringing, and giving air, make it a point to enforce thorough cleanliness in the houses, and amongst the

plants. Nothing conduces more to a disarrangement of the machinery than neglect on this point. The principal operations will be tying and cleaning. In tying or training plants, avoid formality; study in your "mind's eye" the form or habit which the plants would assume in their wild state, and let your training be directed to assist Nature, by giving support and symmetry of shape; for instance, the Passionflower never displays itself to such advantage as when allowed to festoon itself gracefully from the roof of a lofty conservatory: and why? Because this is in accordance with the natural habit of the plant. If this principle be judiciously carried out, the plants will be always interesting, whether in or out of flower. Every individual will still be a perfect specimen of art, in the truest and most enlightened sense of the word; as art will in this case have confined itself to that province in which it never offends, namely, that of aiding Nature in the perfect development of that infinite variety which is her universal characteristic. It is too much the prevailing taste to train all kinds of plants after two or three distinct models; such as the conical, the hemispherical, the peltate, and the cylindrical; and the nearer they are made to approach these set forms, the more perfect they are accounted. The two first of these are the shapes in which shrubby and sub-shrubby plants are generally trained. An immense number of species has a natural tendency to assume one or other of these forms, and, in such cases, it is of course deserving of approbation to assist them in attaining it; but at the same time, we object to their specific peculiarities of habit being too much smothered by artistical clipping and tying. If we could understand the works of Nature thoroughly, we should see that the form, colour, size, texture, and habit of the flowers, leaves, and stems of every distinct species are admirably arranged in accordance with each other, so as to form one perfect whole; and that if these relationships be altered or mutilated, the original design is lost, and the harmonious combination in a great measure destroyed.

FORCING DEPARTMENT.

Grapes just colouring should be assisted by a high temperature in fine weather, accompanied, however, with abundance of air, and with a moderate fire heat in dull or cold weather. The greater part of the litter should now be removed from the front borders, leaving a little of the most decayed, to prevent too sudden a check, and to be forked into the soil a week or two hence; or if, as is commonly the case, the roots have entered it, it may be allowed to remain on the surface, instead of being forked in. In the late houses, where the fruit is just set, let it be the aim to preserve the health of the foliage, to which end, the atmosphere, which was kept dry during the setting of the flowers, should now be supplied abundantly with moisture by means of the syringe. Care should be taken to prevent, by the frequent use of sulphur, the establishment of red spider or other insects. When no plants are grown beneath the Vines, the laterals may be allowed to extend themselves, so long as they do not by their shade interfere with the action of the sun on the principal leaves. Pay particular attention to the tying of the shoots in the direction which will afford them the best opportunity of a healthy development. PEACH-HOUSES.—In the earliest house, as soon as the crop is gathered, the trees should be well washed with the engine, and syringed daily; the hot-water pipes, and any part of the house which is exposed to the action of the sun, should be washed over with lime and sulphur, to keep down red spider; and if the soil is dry it should be well watered. These directions are given with a view to preserve the leaves, and to keep the plants in a healthy steady growing state as long as possible. By this means the plants accumulate an extra quantity of elaborated sap, and avoid the injury arising from the alternate checks and excitements which are generally experienced during autumn in our variable climate by plants which are allowed to go early to rest.

FLOWER GARDEN AND SHRUBBERIES.

Active measures should be taken to prevent the ravages of caterpillars, aphides, and other insects, which, if allowed to establish themselves unchecked, will soon do considerable damage. The best means of getting rid of caterpillars is by hand picking, and of other insects by means of the garden engine. Caterpillars, however, are very numerous, and, unless active measures are taken to destroy them, they will soon do material injury to the flower-buds. Pinks should be propagated immediately; it should not on any account be put off after the expanding of the first flower in each plant, and the only good reasons for waiting so long are to secure the correct labelling of the young plants and the selection of cuttings from the best varieties. If slippings are taken from the plants now they will strike with much greater facility than either slippings or cuttings taken a month hence, besides having the advantage of a longer season to establish themselves in before winter. Particular attention should be paid to the plants which were plunged in the reserve garden, to fill up any gaps which may occur during the early part of summer; and if any more can be selected from the late spring stock, it should be done; as it is worth while to be at a little pains in keeping up a creditable display as late in the season as can be managed. As many of the fancy Pelargoniums are admirably adapted for planting in masses, attention should be paid thus early to their propagation, by those who possess only a few plants, that they may be able to make a creditable display next season. Amongst the most suitable varieties are Nosegay, Anais, Jehu Superb, Hero of Surrey, Bouquet de Flore, &c. Shepherd's Victoria is too delicate for out of doors, except in very favourable situations. Dashing rains quite disfigure the flowers of it and some few others, which are very beautiful in the greenhouse, but whose flowers are wanting in texture to stand the storms.

HARDY FRUIT GARDEN.

If it is the desire of the cultivator to carry out the principle of pruning with the finger and thumb, instead of with the knife, he must now be very active. To allow wood to be produced, which must not only be cut away again, but which, during its growth, is materially damaging the portion which is to remain, carries with it the appearance of very bad management to every reflecting mind. Thin the young shoots which have been thrown up by the Raspberry stools, leaving from three to six of the best, according to their strength; these will form fine strong canes to form arches with, or to tie to rails, at the next winter pruning. Any young shoots coming up at a distance from the old stools may be left to form plants, which may be taken up in winter to furnish new plantations, if such are likely to be required. Caterpillars on Gooseberry or Currant trees should be destroyed by hand picking, or by dusting the trees with a little quick-lime. The cleanest way of proceeding is to dissolve some lime in water, and after allowing it to subside, to syringe the trees with the clear liquid.

FLORISTS' FLOWERS.

The beauty of the Tulip is now fast passing away, and, as soon as the petals drop, we would advise the capsule (or seed vessel) to be broken off, unless seed is required. When this is removed, the foliage sooner becomes yellow, and their taking up is expedited. We do not like bulbs as they are ripening to be exposed to soaking, heavy rains; for our experience tells us that it is detrimental rather than otherwise. Where the amateur has an awning over his bed, it will be better to remain on until the roots are taken up. CARNATIONS AND PICOTEES.—Examine the points of the shoots which are spindling for bloom. They are often attacked with aphis or green-fly; a camel-hair brush is perhaps the best thing to remove them with; a man will look over a large stock in a few hours. Water well; when applied, let the mass of soil in each pot be thoroughly soaked. Great care also must be taken in tying up the spindles; they must not be drawn too close, but room allowed for them to elongate. Weak liquid manure in damp weather will be highly beneficial. POLYANTHUSES are apt to suffer at this time of the year from the action of the sun; calico, tacked on light deal frames, makes an efficient shelter; when this is not attended to, the red spider will make great havoc with them. PINKS.—Give liquid manure, remove superfluous pods, and, when forward enough, secure the pods retained with a small ligature. DAHLIAS will be all the better for copious waterings; place the sticks to which they are to be attached immediately.

KITCHEN GARDEN.

All crops, which it is an object to bring to a high state of perfection in a short space of time, as early Peas, Cauliflowers, &c., will be considerably benefited by being watered with liquid manure; first loosening the surface of the soil with a fork, to allow the liquid to permeate the mass more thoroughly, and at the same time to produce a surface less favourable to evaporation. Another advantage arising from frequently stirring the soil, is in its allowing a freer action of sun and air, and at the same time the growth and increase of worms will be prevented. Advantage should be taken of all dull and showery weather to prick out young seedlings of Celery, Cabbages, &c., into nursery beds, and to transplant the strongest plants of earlier sowings into their proper places. Basil, Savory, Tomatoes, and other things raised in hotbeds, should now be transplanted. Continue to sow Peas, Broad and Kidney Beans, in succession, as soon as those of the last previous sowing appear above ground. Peas of former sowings must be furnished with stakes as soon as they appear above ground, taking care that stakes of the requisite height are used in all cases. As soon as they have grown within a few inches of the tops of the stakes, the tops of the plants should be pinched off. Do not allow any crops which are cultivated for the sake of their roots or leaves to run into flower or seed, as Onions, Spinach, Parsley, Rhubarb, Lettuce, &c. Let the whole energy of every plant be directed, if possible, to the perfect development of that part for which it is cultivated, whether it be leaf or fruit; and any plants which have passed the stage in which they are useful should be immediately removed. The early grown crops of Parsley now require thinning; for the present it will be sufficient to leave them about 4 inches asunder, retaining the finest curled ones; as the plants increase in size, the intermediate ones may be cut away as they are required for use. Radishes and Lettuces should now be sown on very rich moist ground; but, if the soil is of a hot and sandy nature, it will be better to cultivate these salads under the shade of a north wall during the summer.

State of the Weather near London, for the week ending June 6, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 12th and 13th, 1842—therm. 90 deg.; and the lowest on 15th, 1841—therm. 36 deg.

Notices to Correspondents.

TO OUR CORRESPONDENTS.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

BACK NUMBERS: Full price will be given for Numbers 29, 46, and 47, for 1848.

CHISWICK FETES: *A Country Reader.* May we beg of you to consult the *weekly* advertisements. The next is July 13—and then they end.

GLASS: *Wisehead.* There is no room to doubt the excellence of Hartley's patent rough plate. See some correspondence about it in another column.

GRAPES: *A B.* Your Grapes split because they receive more sap than they can hold; so of the Melons. The cause may be either that the skin does not grow fast enough, owing to injury inflicted upon it, or that sap is poured into the fruit in undue quantity.

GUANO WATER: *Norwood.* Half-a-pint of guano dissolved in 6 or 8 gallons of water, and applied as circumstances required, has been found of service to many kinds of flowers; but, as we stated last week, no fixed rule of application can be given; for what suits one kind of plant might kill another. As to vegetables which are wanted to grow quickly, you can hardly go wrong with them. Of course they will take stronger doses than flowers.‡

INSECTS: *S R F.* The Julus sent is one of the larger and rarer of the British species, but it came crushed to pieces. The volumes of British insects in Jardine's "Naturalist's Library," with Westwood's "Entomologist's Text-book," will most probably answer your wants. *W.—Mediensis.* The insects sent are the common cockroach. Place basins on the floors at night, with a bit of bread in each, and some rags round it, to enable them to creep up. The smooth surface of the basins will prevent them crawling out again, and they must be scalded to death in the morning. Poisoned wafers, and such like nostrums, are useless. *W.—A R T.* Thanks for your notes on the Gordii, they shall be borne in mind. *W.—H R B.* The insects which have done so much injury to the buds of your (and most other persons') Roses this year, are a species of Weevil, Otiorbynchus tenebricosus. The best plan for their destruction is to spread a cloth under the trees at midnight, when they are feeding, and then shake the trees, when the beetles will fall to the ground, and must be destroyed. *W.*

NAMES OF PLANTS: *Diss.* A white variety of Orchis Morio.—*T D.* Wretched fragments of some Hyoscyamus, perhaps H. aureus.—*W M.* Silver weed, Potentilla anserina. It may be killed if continually pulled up as it reappears.—*W D.* Hibbertia volubilis.—*L N R.* Geranium pyrenaicum.—*Anon.* Epidendrum alatum.—*J W.* Your letter contained nothing more than a morsel of a leaf secured by a piece of stiff paper. Whatever you may have intended to send must have escaped.

PARROT: *Clergyman.* Feed it on soaked bread and Hemp-seed; but Hemp-seed of itself will do.‡

PAXTON'S COTTAGERS' CALENDAR may be had at the Office of this Paper, or of any bookseller, price 3*d.*, or 5*s.* for 25 copies for distribution amongst cottage tenantry.

PEACH TREES: *A Young Sub.* Curl is caused by cold and damp. Yours is caused by cold, damp, and mildew. Sulphur will kill the last, shelter in time will prevent the first.

POTATOES: *A Country Curate.* Your Potatoes are suffering from a well known disease called in Cornwall "Bobbin Joan." The cause is unknown; but is supposed to be parental debility.

RURAL CHEMISTRY, by E. Solly, price 4*s.* 6*d.*, second edition, revised and enlarged, may be had of all booksellers, and at the Office of this Paper.

THE TREE ROSE: *W D.* At the request of numerous subscribers the price of this work is now reduced from 4*s.* 6*d.* to 3*s.* 6*d.*, post free; it can be forwarded to any address by a Post-office order being sent to James Matthews, at the Office of this Paper.

WALL PLANTS: *Citizen.* All Sedums and all Alpine Saxifrages will do equally well for your dwarf stone wall which is built without mortar; but they ought to be planted in a mixture of clay and cowdung, or they will never make a start. Take *all* the sorts you can procure.

MISC: *J S.* Apply to Dr. Newington. See advertisement in another column.—*G F P.* If Seakale be not cut before it is too far advanced for use, the plants should not be cut down, for they will be stronger for the next season by allowing them to remain uncut.

SEEDLING FLOWERS.

BEGONIA: *Anon.* A good addition to this useful tribe of plants.*

CALCEOLARIAS: *Salopian.* All prettily spotted varieties; but none of them equal to kinds already in cultivation.*—*M B.* The above remark also applies to your seedlings. We must have something more distinct and better formed.*—*A S.* Shrivelled up when received, but apparently worthless.*

CINERARIAS: *S W.* No improvement on kinds already in cultivation.*—*T M. a* and *e* are the best, and the white may be worth growing, for pure whites are scarce; but they are all short-coming in the properties essential to a good florist flower.*

MIMULUSES: *A C.* The orange seedling in the way of formosa elegans is well worth growing. The others are inferior to your seedling raised some time ago, called ruberrimus, which is one of the best Mimuluses in cultivation.*

PANSIES: *J N, Boston.* The sulphur-coloured flower has yellow under the eye, and the eye of the white ground flower joins the margin; therefore both are useless as show flowers. The dark seedling is much the best; but it has some defects, as serrated edges and long, &c.*

PHLOXES: *A C.* "Splendens" is uncommonly like "Madame Celeste," a variety "sent out" by Messrs. Henderson last year.*

WALLFLOWER: *J C.* Your double, dark (nearly black) Wallflower is handsome, and well worth cultivating.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10	0	0
Clover Manure, do.	11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

CORN MANURE.

BLASHFIELD'S PATENT COPROS.—A new Manure for Corn and other Crops, containing Ammonia, Phosphate of Lime, Potash, Soda, Magnesia, Silicate of Potash, &c. Price, delivered alongside a vessel, or any Wharf in London, 8*l.* per ton. It is sold in a finely-ground dried powder, by the Patentee, at No. 3, New London-street, Mark-lane, London.

Superphosphate of Lime, Gypsum, Sulphate of Ammonia, Sulphate, and Nitrate of Soda.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND is desirous of receiving TENDERS from Innkeepers or others, to supply a COLD DINNER for 900 Persons, in the Society's Pavilion at Exeter, on THURSDAY, the 18th of July, 1850.

Printed Forms of Tender will be delivered or forwarded on application to the Secretary; and they must be filled up and returned to him, at the House of the Society (No. 12, Hanover-square, London), on or before Tuesday, the 18th of June; the Society not binding itself to take the lowest Tender.

By Order of the Council,
London, June 5, 1850. JAMES HUDSON, Secretary.

The Agricultural Gazette.

SATURDAY, JUNE 8, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June	12—	Agricultural Society of England.
THURSDAY, —	13—	Agricultural Imp. Society of Ireland.
WEDNESDAY, —	19—	Agricultural Society of England.
THURSDAY, —	20—	Agricultural Imp. Society of Ireland.

THE PRIZE-LIST OF THE BIRMINGHAM AND MIDLAND COUNTIES' EXHIBITION OF FAT CATTLE, SHEEP, PIGS, AND POULTRY for 1850 is now out, and competitors who propose entering into this honourable and friendly rivalry may be glad to know that the scheme is to be had on application to Mr. J. B. WRIGHT, the Hon. Sec., who has already done so much for the Exhibition since the first idea of it was entertained, to the credit of himself and the thankful satisfaction of all parties who have come into intercourse with him. But we do not propose at present to meddle with the quadrupeds, although, if the pigs be as good this year as they were last, they alone will give a high character to the show. The Birmingham meeting takes place at much about the same time with that of the Smithfield Club: but London and Birmingham are surely far enough apart to avoid all clashing of the interests of the two shows, while the railway quite puts it into the power of whoever requires to see both, to gratify the desire with ease. The principle of competition amongst the cattle is different at these two meetings; one running breed against breed without distinction, the other only allowing specimens of each breed to compete with those of their own kind. As to the respective merits of these plans, good authorities are not agreed; but we may believe that in each Association are to be found men of sufficient candour to adopt that system which, after a separate trial of a year or two, shall be found to work in decidedly the best manner. At least there is ample room, for the present, for both shows to go on progressing without injury to each other.

But the poultry department is our immediate concern; and the name of his Royal Highness Prince ALBERT has been added as a patron to the Birmingham Poultry Prize List, as well as to those for the animals, and we may now, therefore, hope to see a few lots from the royal aviaries, as some were last year exhibited from the Prince's farm. Indeed, it was believed at the time, that but for the adverse circumstance of the death of the late QUEEN DOWAGER, the Exhibition would have been honoured with the presence of the Prince Consort.

Now is the time when poultry matters are in their highest activity, and therefore a perusal of the Prize List will opportunely suggest the plans which it will be most desirable to lay out for success. One thing should be remembered, which is, to keep a correct poultry stud-book. In one of the best and most generally admired classes, namely, 14.—"For the best pen of six Chickens (of many different breeds) of 1850"—it is required that "the age of the specimens exhibited in this class must be accurately stated, viz., the day on which they were hatched." The amount of money to be awarded has been considerably increased, although the former prizes were found to be sufficiently stimulant. But two honorary rewards have been added, which will cause no little excitement among the exhibitors, and no small difficulty to the judges, whose anxieties increase as they find lots, of high merit, running each other closely, and who perhaps would be thankful to be spared this further responsibility. The task is almost as hard as the Choice of Hercules.

"The large Silver Medal will be awarded as an additional prize for the best pen of Fowl in the Exhibition, to be selected from the prize Fowl exhibited in the first 13 classes.

"The small Silver Medal will be awarded as an additional prize for the best pen of Chickens in the Exhibition, to be selected from the prize Fowl in Class 14."

So, those who mean to bear the bell, and take supreme rank above even the successful exhibitors, must immediately collect their materials, and go to work. The chance is that whose destiny it is to rise, *crême de la crême* above all, have already steamed up their incubators (Gallinaceous, Anserine, or Cantelonian) to the hatching-fever temperature.

One regulation on the list shows the liberality of the committee more, we fear, than their prudence or caution. "Cottagers may compete in any of the poultry classes without subscribing." Gentlemen who have been connected with provincial Horticultural Shows in populous districts will easily prophesy what will be the result of this. Much future perplexity might perhaps have been spared by inserting a definition of the term "cottager;" though we hold it would have been far better to offer liberal encouragement to cottagers, in a class by themselves, strictly defined. No fowl-dealer, small farmer, gentleman's servant, game-keeper, &c., or person whose rent exceeds (the maximum to be stated) —*l.* a-year, ought to be allowed to exhibit as a cottager; and a certificate should be required from the clergyman of the parish, or some other respectable referee, that the birds had been seen in his possession for such and such a time previously. But as the rule stands, a troop of cottagers may invade the Exhibition, each one coming from

> "A cottage with a double coach-house;
> A cottage of gentility!"

And instead of manifesting the "Pride which apes humility," may prefer to enact the comedy of "He or She stoops to Conquer," and sweep away the best of the prizes. Who is not a cottager, if the resident tenant of a cottage be not one?—whether it stand as a lodge at a nobleman's park-gate, or belong to the class styled *ornée*, or be *bonâ fide* a poor labouring man's home. "But why attach so much importance to such things as mere poultry? We can understand the use of encouraging the aiming at perfection in such substantial suppliers of food and clothing as are the cattle, the sheep, and the pigs; but the fowls are of so little value, and, in point of quality, are already as good as can be desired."

If their individual value is trifling, their numbers are, not infinite, but certainly incalculable, and the rule of multiplication will demonstrate that the aggregate *is* of great importance. The merits of our ordinary run of poultry are, we admit, considerable, but they are diverse; and the use of such Meetings as that expected in Birmingham is to help poultry-keepers to get exactly *what* they want, and that the best of its kind. Thus, if you require chickens, you will be disappointed to get nothing but eggs from your home farm, all summer long; and, on the contrary, if your cook keeps calling out for 'eggs, more eggs!' you will be annoyed to be overswarmed with chickens only. And of each kind of produce there are various grades suited for a special set of consumers more than for any others. At Birmingham a sight, at least, and a clear idea of these diversities among fowls will be to be obtained, to say nothing of the ocular proof of how much beauty may be made to consist with usefulness, and homely merits with the gratification of taste. An extract from a friend's letter will show that some leading standard exhibition to assist in making a selection of the best poultry, is, just now, really wanted.

"26th April, 1850. At —— I went to the Duke's private farm to see the poultry there, and was very much disappointed to find a perfect mongrel breed. He had one or two very good game hens, what we call the black-breasted red, but nothing else worthy of notice; in fact I have not seen any good poultry in the whole county. There were one or two good specimens of the golden pheasant (spangled Hamburgh or copper moss) hens; but the most common kind is a sort of speckled fowl, brown and grey, with a little tuft on the head."

It would be a breach of confidence to name either the county or the noble Duke that are thus unfortunately below par in respect to the feathered portion of their live stock. His Grace is a nobleman of cultivated taste and acknowledged liberality, and should these columns meet his eye, as is very possible, he may perhaps be led to inquire into the condition and merits of his own stud of fowls, and those of his tenantry and neighbours, and think whether there will be any harm in extending a little patronage to, and deriving a little benefit from, the Birmingham Exhibition of next December.

IT will be seen from the advertisement in another page, that the Great Annual Cattle Show of the Royal Agricultural Improvement Society of Ireland will take place at Cork on the 24th and 25th of July, in the week after the meeting of the English Agricultural Society at Exeter. Implements and stock can be transmitted, free by steam, from the ports of London, Portsmouth, Plymouth, Bristol, and Liverpool, an advantage which will, no doubt, be widely made use of—so that this meeting promises to be one of the most interesting and useful that has yet taken place under the auspices of the Society.

The three national societies have this year so timed their annual meetings that a visitor may attend them all: Exeter, Cork, and Glasgow may thus be visited in succession during three successive weeks; and we have no doubt that many will avail themselves of the opportunity thus afforded of inspecting the bright page of agriculture in each of the three divisions of the country.

ARABLE AND PASTURE LAND, AS REGARDS THE PRODUCE OF MEAT.

IT will be our first duty to compare Grass and arable land in reference to our particular subject. But I must confess that it will not be any result to which that comparison may lead that will justify or condemn the continuance of the former. It is the value of the *free* produce—the worth of the remainder after all outgoings have been deducted from the gross returns of the land, except those for division between the only parties immediately concerned in the proposition, that will determine whether the condition to which those are owing shall continue. And it must be confessed that over a large extent of good land now in pasture, the deduction on account of labour is so small, and the gross produce so considerable, that neither landlord nor farmer has any interest in breaking them up. Land yielding 12 or 15 tons of green food per acre yearly without any labour but that of repairing the fences which divide it, destroying the Docks and the Thistles which invade it, and supplying manure to maintain it, is producing more at less expense than perhaps it could do in any other condition. It is not in such cases as this, then, that our comparison must be made: there is much poor pasturage in the country, which lies nevertheless under a climate proper for arable farming; and it is about this that the question obtains.

There is no doubt that over much of this which, though drained, would not yield 30 tons of green food per acre, in four years, an equal quantity might, if it were properly cultivated, be obtained in Turnips and Clover, with probably 2 tons of straw and 60 or 70 bushels of grain in the same time. Grass is probably more nourishing per ton than Turnips; but when the one is consumed in all weathers by unsheltered animals, and the other in well-bedded houses, it may be doubted whether the resultant produce of meat may not be about the same in either case—with a clear balance of course of so much grain as food for man in favour of arable culture. But this matter requires a detailed estimate, and this I shall endeavour to give, merely premising that the above figures are not given without reason; as on the farm I write from, three quarters of which were formerly Grass, a stock of about 40 head of oxen fattening to 60 or 70 stones, and between 200 and 300 sheep fattening to 24 lbs. a quarter, with 50 or 60 pigs, are now kept during winter, and about half those numbers during summer, where formerly a herd of 25 cows and about 20 yearling and 2-year-old heifers, with a few pigs, were maintained in store condition; while, in addition to the above, the land now permits an annual sale off it of about 4000 bushels of Wheat.

Grass-land worth 30*s.* per acre of annual rent may be

supposed to yield 8 tons of Grass per acre per annum; and this may be believed able, by careful consumption, to produce 9 imperial stones of beef; or at 6*d.* per lb. a money value per acre of 18*l.* 18*s.* in six years.

The same land, broken up, would under good management, yield during—

The 1st year	25 cwt. of Wheat-straw
2d	24 tons of Mangold Wurzel
3d	25 cwt. of Wheat-straw
4th	18 tons of Swedish Turnips
5th	20 cwt. of Barley-straw
6th	10 tons of Clover

Or 52 tons of green food, and 3½ tons of litter, in six years, beside the produce of grain. Of course it is easy so to state figures as to arrive at any result that may be desired; but in the above I have gone upon what I believe to be reasonable data, viz:

That 24 or 25 cwt. of hay is a probable produce from land of such value;

That hay is one-fifth or more of the Grass from which it is made;

That the growth of aftermath is to the growth up to hay harvest as 1 to 3 on such land.

We know from experience that Turnips consumed without any artificial food, as it is called, given with them, will not generally yield more than 1 lb. of beef or mutton for every 150 lbs. of green food; and giving Grass credit for a little more nourishment than this, we have assumed that 140 lbs. of it will yield the same meat.* On the side of arable land, again, I have stated amounts of produce which from several years' experience I know to be probable. The 52 tons of green food (supposing the straw to be all used as litter) will on the above datum yield 776 lbs. of beef, and this at 6*d.* per pound is worth 19*l.* 8*s.*, an amount rather larger than that which was the whole return from the Grass, while here we have, in addition, the produce of three crops of grain. Whether the whole extra expense of this mode of managing the land will be more than paid by this extra produce is hardly within the province of this inquiry. We may now suppose another case—that of arable land wholly devoted to meat-producing crops, and it may be supposed to yield thus:

1st year	26 tons of Mangold Wurzel
2d	30 cwt. of Bean-straw, and 34 bushels of winter Beans, harvested in time for Rye to be sown, which would yield
3d	12 tons of green food in the following May, to be succeeded by Rape, yielding 16 tons in November
4th	30 cwt. of Barley-straw, and 48 bushels of Barley
5th	20 tons of Swedish Turnips
6th	30 cwt. of Pea straw, and 32 bushels of Peas; the land then to be thoroughly tilled for the following Mangold crop.

Here we have 26 tons of Mangold Wurzel
12 ,, Rye
16 ,, Rape
20 ,, Turnips

Or in all 74 tons of green food
And 30 cwt. of Bean straw
30 ,, Barley
30 ,, Peas

Or in all 4½ tons of straw.
And 34 bushels of Beans
48 ,, Barley
32 ,, Peas

Or in all about 3 tons of grain.

The average produce per acre of the different crops is put higher now than before, as every farmer will admit that under such circumstances (all the produce being converted into manure) it ought. Now, if an ox consume 1 cwt. of Turnips daily, in the above case he will need to eat 5 lbs. of grain and use 8 lbs. of litter daily, in order that all may be finished together. The straw will be little enough, but oxen fattening to 7 cwt. will fare well on the food: they will pay at least 5*s.* a week upon it, *i.e.* 5*s.* for every 7 cwt. of roots and 35 lbs. of grain; and the stock of food would at these rates keep 4 oxen for 50 weeks, yielding a money return of about 50*l.* from the sale of the meat produced. According to this, about 8*l.* 10*s.* per acre is the highest produce of meat from land of the quality named; and whether that, taking the large labour of crops into account, is a profitable produce does not appear. But we may suppose a third method of cultivation in which the produce, summer and winter, is fed upon the land by sheep, and the following amount of the several crops may be expected:

1st year	20 tons of early Turnips, followed by Rye, yielding next May
2d	12 tons of green food, followed by Rape, yielding in November 16 tons of Rape
3d	26 tons of Mangold Wurzel, followed by Vetches
4th	16 tons of Vetches, consumed in time to sow Italian Rye-grass
5th	8 tons of Rye-grass, followed by 20 tons of Swedish Turnips
6th	20 tons of Belgian Carrots

Here we have a gross produce of 138 tons of green food in six years, which at 1 lb. from every 150 would yield 2060 lbs. of meat, or 51*l.* 10*s.* worth per acre in six years; rather more than in the former case. The two latter cases are not likely to be generally adopted until long experience shall have determined their profitableness: and to no subject, we are convinced, could an agricultural experimenter more usefully devote himself than this. If a cultivation of this kind would pay, it would be a source of immense wealth in many parts of Ireland, where waste-land reclamation proceeds so slowly mainly because of the unprofitableness of corn-cultivation under their watery skies. The results of our first estimate, therefore, must be the standard with which to compare the productiveness of Grass, and it has been seen that the former, besides the large crops of grain on the arable land, yields more meat than the latter. The conclusion which therefore seems to be unavoidable is, that in cases when equal skill and care have been brought to bear both on arable and pasture farming, the latter might be converted without diminishing, and probably with an increase to the national supply of animal food. What other advantages would follow the breaking up of poor Grass-lands have already been considered in this Journal. *English Agricultural Society's Journal.*

* The best grazing land in Lincolnshire we are told on first-rate authority will, under the best circumstances, feed an ox and a sheep from New May-day till Old Michaelmas. The former will gain 20 stones, or 280 lbs., and the latter 10 lbs. a qr., or 40 lbs. in the time. The acre will thus yield 320 lbs. of meat. Its produce of Grass may be 16 tons—perhaps more. This is 1 lb. of meat for every cwt. of Grass, but we must remember that the Grass of such land differs from the average in the quality as well as the quantity of its produce.

TOWN SEWERAGE.

PUBLIC attention has been once more directed to the economical and sanitary importance of the sewage of towns by a paper from his Royal Highness Prince Albert, read at a late meeting of the Royal Agricultural Society by Colonel the Hon. Charles Grey.

The sewage of towns is important in two points of view. Where large populations are gathered together, as in our modern towns and cities, it becomes an object of the first importance to get rid of the filth and refuse of all kinds in as summary a manner as possible. For this purpose no better arrangement has hitherto been devised than was adopted in ancient Rome, or perhaps in cities still older. In Rome, the Cloaca maxima, or main sewer, after the lapse of 20 centuries, still in part accomplishes for modern Rome what its builders believed to be necessary for the ancient city. Then, as now, the only object aimed at with regard to the sewage was to get rid of it as speedily as possible; the more quickly this was effected, and every improvement in the arrangement of the sewers to effect this purpose, being justly considered to be the best possible means for securing the public health. To obtain this important blessing, we are, however, at present sacrificing an enormous quantity of valuable manure. At the same time that we are ransacking the globe for the dung of sea birds, we are losing thousands of tons per annum of a substance nearly as valuable as guano, and that, too, at our very doors. Still, though we are perfectly aware of this, no means have hitherto been devised which would at the same time avoid this waste and secure our health from injury.

The plan which Prince Albert suggests is a modification of the cesspool (in use in many parts of London, and nearly universally in Paris), into which the drainage of each house is collected, so that the solid matters settle to the bottom, and the watery part is carried off by the usual drains. The objection to this arrangement is, that under each house is placed a mass of putrifying matter, which must prove a hotbed of disease and death.

The proposed plan in some respects obviates this difficulty. It is proposed by a simple filtering apparatus to retain the solid matter of the sewage water, and to allow the liquid part at once to run off. The filter is to consist of a tank with a perforated false bottom, upon which the filtering medium is to be laid. The sewage water is to be admitted below the false bottom, the conducting pipe being so arranged that the water shall rise up through the bottom by pressure, and pass off into the drain. Charcoal, gypsum, and burnt clay are recommended to be used as filtering substances for placing in the perforated bottom.

We leave to more experienced hands in such matters the discussion as to the cost of affixing such an apparatus to a modern dwelling house. Our reason for meddling with the question is its importance to agriculture, on which no greater boon could be conferred than the solution of this vexed question.

In Paris the contents of the cesspools are lifted out by properly constructed pumps, and conveyed away in covered carts to a manufactory at some distance, where they are emptied into immense shallow reservoirs. After standing to settle, the liquid part is run off, and the solid matter is then dried and carried to all parts of the kingdom under the name of "poudrette." The proposed filter avoids one part of the evil attendant on the Parisian method, as the conducting pipe acts as a most effectual stench trap. But at the same time we greatly fear that the difficulty of clearing it out, and the expense of the filtering medium, will prove a serious drawback. Besides, the substance obtained, by being mixed with the charcoal or gypsum, will also be of less value than the "poudrette."

These are the difficulties which beset the subject. Of the value of the sewage of towns to agriculture there cannot be a question; but to secure it, by means of cesspools or filters, it is of the highest importance to prove to the householder that he will receive interest for the money he may expend in the construction of the necessary apparatus. As a farmer, I would not consider the contents of one of these filters worth more than 7*s.* or 8*s.* a ton on the spot, in the state in which they would be removed from the tank. This price does not leave much margin for profit on the outlay necessary for the adaptation of the arrangement to a dwelling house.

If anything like a correct estimate could be formed of the value of what is, by our present arrangements, annually lost to agriculture, the importance of the question, in a national view, would at once be evident to every one. The present age presents the singular anomaly of the English farmer seeking his fertilisers from the further ends of the globe, and yet, at the same time, unable to obtain any benefit from thousands of tons of a valuable manure, which at present is only devoted to the pollution of every navigable stream in the country.

It is hoped that this paper by his Royal Highness Prince Albert will at least have the merit of calling attention to this important question—a question involving the health of the community, and the prosperity of agriculture is not unworthy of the attention of any person, however important his situation, and now that such an example has been set, good results are sure to follow.

The "sewage of towns" and its application to agriculture is a question we would recommend to the attention of the Royal Agricultural Society, as a most appropriate subject for a prize essay. The bearing of the question upon public health deserves more attention from Government than it has hitherto received. *T. L. C.*

A VISIT TO SUTTON WALDRON.

MUCH having been said for and against Mr. Huxtable's system of farming, I was anxious to judge of it with my own eyes. Accordingly, last month (Feb., 1850), I visited Sutton Waldron, where the rev. gentleman resides, whose name is now so widely known over England, Scotland, and Ireland. He is rector of the parish, and much beloved by its population as a pious, active, and exemplary minister of the gospel. At his own expense he has erected a parsonage house and a beautiful church; and although much more might be said of his conduct as a pastor, it is sufficient for my present purpose to show that, in patronising in the hope of improving various processes connected with secular employments, and thus instructing others, he by no means neglects his still more essential spiritual duties.

About 11 years ago he commenced farming, less for his own advantage than from the more generous impulse of diffusing employment, at a period when work was scarce, wages low, and the labourers within the locality suffering severely. As a preliminary he taught himself agricultural chemistry; and after acquiring an intimate knowledge of that great hand-book to husbandry, he composed a most instructive essay "On the Science and Application of Manures," afterwards delivered in the form of a lecture, at Blandford, Feb. 3, 1847, to a large assemblage of farmers from Wiltshire and Dorsetshire.

Mr. Huxtable occupies two farms as a tenant, and rents both from the same landlord. The first consists of 100 acres on the galt formation; in other words, a stiff, stubborn, tenacious clay. The second farm comprises 300 acres, surmounting chalk, and naturally exhibiting a dry, porous soil, elevated 500 feet above the valley beneath, bleak from exposure, and destitute of shelter. In the beginning he had literally everything to do—erecting farm-buildings—cutting and metalling roads at great expense; draining and subsoil-ploughing the whole of the clay possession; and laying wooden pipes to conduct from the different tanks the liquid manures requisite for watering his crops. Over the stiff land he demolished and cleared all and every fence by throwing the whole into a single large inclosure, from the circumstance that the house system of feeding adopted for sheep as well as cattle, renders minute fencing a hindrance, and not a help.

The system adopted at Sutton Waldron, stall-feeding stock summer as well as winter, is extensively practised on the continent, and particularly in the meat producing countries of Switzerland, Belgium, Denmark, and Holland, which are constantly pouring into Great Britain their in-door fattened produce, whether in the dead or living state. And it says much for Mr. Huxtable's acumen—priority in introducing the foreign improved system; and thereby demonstrating how many more animals may be profitably nurtured on a given extent of ground—mainly in consequence of increased supplies of manure, and economy alike searching, measured, and minute, in all the outgoings and incomings connected with cultivation. This of itself constitutes a great fact, teaching, as it has done already, and must do with added force hereafter, how the foreigner may be met and beaten with his own weapons in the manufacture of beef and mutton as cheaply produced at home, as where seas divide, implying freight, insurance, commission, and other expenses. Large wooden buildings, of the cheapest construction, have been erected on both the farms alluded to, for feeding under cover cattle, sheep, and pigs; and architectural contrivances so adapted to the floors of these as to avert the slightest waste of liquid manure, all of which finds its way into tanks, and is afterwards conducted by a forcing pump through the underground conduits, which intersect the clay farm in all convenient directions. The clay pipes, 1 inch thick, cost 7*d.* per yard, or 1*l.* per acre; and are tightly cemented together with Portland lime. At every 200 yards there are discharge cisterns, where the manure is drawn out and used for fertilising vegetable products. Red Clover and Italian Rye-grass are thus watered immediately after cutting; for if the stalks are allowed to become dry, growth receives a check requiring an interval for recovery, unless quickly re-stimulated in the manner mentioned. The precaution, however, is a simple one, and wherever it is attended to, Clover may be cut four times in the season.

Equal care is taken in economising more solid manures. Wooden sheds, 40 feet long by 15 in width, are employed to contain it, so that neither sun nor rain can either lessen bulk or impair quality by evaporation. Part is stored by itself free from all straw; and another

part is mixed with straw and litter. The heap kept by itself is composed of horse, cattle, sheep, and pig dung, the droppings of animals fed in the sheds. When dried it is used like guano in the drills for sowing Turnips; and is also dibbled in the rows for Mangold Wurzel. Manure mixed with straw in the sheds is daily saturated with liquid manure thrown over it from the tanks; and is thus kept in a sufficiently prepared state when needed for root and other crops. The hints just given, from personal observation, speak volumes as to the care with which Mr. Huxtable collects and prepares every available species of stimulants. This, as regards modern farming, is becoming more and more the one thing needful; nor would it be easy to estimate the loss which ensues to heaps washed for months by the rains so incident to northern climates. That reform in this respect should not have earlier riveted public attention is indeed surprising; but the period cannot be now distant when roofed dungsteads and good tanks will be considered as essential as barns and byres. To render urine receivers serviceable, the eaves of all houses that fall in the same direction should be spouted, and every effort made to preclude the entrance of surface-water.

The sheep, pigs, and cattle, at Waldron, stand for the most part on board floors. The framework on which they stand is made of spars, with interstices half an inch wide, through which liquids pass with ease. The said flooring, however, must be perfectly level, and raised 6 inches from the water-tight bricks or stone-flooring below, the under part being inclined to the drain communicating with the tanks. The space below the floors admits of room for a scraper like a gardener's hoe, used in cleansing out any manure that falls through between the interstices of the spars. Each wooden spar must be 2½ inches wide, and 1½ thick. Still cattle cannot well do without a little straw spread on the boards; much less, however, suffices than when they stand on a brick or stone basement.

The sheep and cattle in-doors are supplied with chopped straw, mixed with green food, such as Turnips and Mangold Wurzel, oilcake and Bean-meal, during winter; and in summer with Tares or Grasses—cut by a machine into small pieces, mixed with straw. The latter substance, in absorbing the juices of the succulent food, renders it more bulky; while its astringent qualities correct the diarrhœtic tendency in green food, which retards fattening in tied-up animals. The Furze or Whin is extensively cultivated for feeding both in winter and spring. When pressed down and its prickles flattened by a heavy stone moving in a circle, the bestial not only relish, but thrive on this diet, particularly when blended with cut straw. At Sutton Waldron none of the Grasses are made into hay; hence the substitutes found in straw, which enable Mr. H. to administer in a green state all the Grasses. The Turnip-cutter he employs is made by Moody of Frome, which divides roots as well as bulbs into pieces of a very small size, thus promoting amalgamation with other substances. The preparation of cattle food, in common with threshing grain, is performed by a six-horse power steam engine; that grinds corn into meal, cuts straw, turns the machine that slices bulbs, bruises the Whin or Gorse, &c.

The sheep-house interested me much; for it was a novel spectacle to see a hundred bleaters tied up like so many bullocks, and treated not dissimilarly in preparing them for market. The house is 54 feet long, by 15, with a passage dividing the centre, along which the animals stand in two rows, fronting each other. A manger contains their food, and in munching they stand on a boarded floor, 3 feet wide, furnished with wooden spars similar to those already described. The passage behind the sheep struck me as too narrow for every purpose requisite. The hirsel thus confined seemed in high health; and not a trace of foot rot observable. Great attention is necessary in securing thorough cleanliness, adequate ventilation, and regulated temperature; otherwise, as experience has shown elsewhere, weakness of some type would steal into the fold. The sheep are of the Southdown breed, and although confined scarcely three months, were on the eve of going fat to market. Weighing machines are used to test the progress of feeding, and experiments made every fortnight.

The pigs enjoy most comfortable quarters, and are in all respects managed in a manner which deserves imitation. Most of the pens have spar-boarded flooring, with a stone floor underneath, shaped like the letter V, to collect manure. At the clay farm there is a dairy of 30 cows—one cow had been in the byre four years; the calves are reared on the chalk farm; about 90 cattle are constantly undergoing the fattening process; much the same number, or more pigs; and as often as number is reduced by sales, recruits of the classes named are purchased to supply their place. Of the cropping system pursued I cannot speak with the same precision. The great object appears to be, by the alternation of grains and roots, to raise as much food as possible, as the seasons revolve, for economy and profitable consumption.

It appears very probable that where arrangements are made enabling tenant farmers to cultivate their possessions, so as to raise succulent food of one kind or other all the year round, to be consumed by the more advanced bestial on the system recommended above, important changes must supervene, affecting as much the relative positions of proprietors and cultivators, as did the great forerunner improvement—thorough draining. And here I allude to extended outhousing, for the accommodation not only of many more animals in winter than are shedded at present; but to get rid of the old-fashioned open-air heaps; and the maturation of all fertilising substances, under circumstances setting at defiance everything like access to rain-water, and the possibility of improvident evaporation—now a *sine qua non* under liberal covenants in high farming. *James Stuart Menteath.*

Home Correspondence.

Mr. Mechi's Accounts.—In common, I hope, with most of your readers, I feel myself beholden to Mr. Mechi for his public-spirited intention of testing his farming operations by the publication of his accounts. Mr. Mechi commenced his career with the avowed purpose of bringing into simultaneous operation all proved profitable appliances, and if his plan has been carried out in detail with practical skill equal to the sound principle laid down, there ought now to be no doubt of its success, except so far as the altered range of prices consequent on free-trade shall affect his calculations. Why, then, so much doubt? In my opinion, because operations treated by Mr. Mechi as demonstrably profitable were considered by practical men not to be of universal application, and not to be supported by sufficient testimony. It was also thought to be by no means certain that operations each singly productive of advantage would, when in union, produce a total of advantage equal to the sum of the separate advantages of each, because it had been found by experience that neither grain nor green crops can bear forcing beyond a limited degree. It was observable also that by comparison of Mr. Mechi's table of expenditure and his estimate of the return to be made from each item of expense, that if the return was no greater than he put it at, much of his expenditure would be wasted; and particularly that on buildings, which appeared to give not more (speaking from memory) than 1½ per cent., per annum. Mr. Mechi, I presume, has now got his farm, both buildings and land, into order; has served his apprenticeship; is to have a new valuation, and to start afresh; and it is of his proceedings from this time forth that he is to give us his accounts. We cannot fairly expect more of him in that way. But as Mr. Mechi is no common farmer, but in some sort an experimentalist, and like Mr. Huxtable and others, endeavouring to improve the science, I would suggest to him, if these lines should fall under his eyes, that, out out of his past experience, he should enlighten us through your sheets from time to time as to how far the doubts suggested in the former part of this paper have been found by him to be well founded, and how far not; and also that he should keep, if he conveniently can, a separate account of his experimental agriculture, and not merge it in the general account of his routine farming. *A. H. Hall, Watergate, Petersfield.*

Practice with Science.—A series of articles have been given with the view of laying down the principles of good farming, and showing in what manner these may be best brought to a successful issue. The principles upon which good farming is founded are few, plain, and intelligible, the whole of them being comprised in four simple operations, viz.: making land dry, clean, fine, and rich. All the works of our most eminent agriculturists, all the discussions at our great shows, all the performances of our best farmers, have served only to elaborate these four processes. It is not by taking any of these separately that good farming can be attained, but rather by a happy combination of the four put together, and by a judicious adaptation of the parts to the whole. It may here perhaps be of use to bring into a small compass the leading points of each process. 1st. Draining is intrinsically important, not only in doing good of itself, but likewise in being essential to the well working of the other three. Stagnant water, under any circumstance, must be injurious, but by the removal of it further advantages are obtained. When the land is laid dry the work of the plough may be going on at most seasons of the year; the soil is brought into a more friable state, and it does not become so consolidated from a heavy fall of rain. Such are its advantages, that the expense may often be repaid in a single year. 2d. Land being kept clean is one of the first things in good farming. It would seem needless to say that weeds take from the soil that strength and fertility which ought to be reserved for the crop alone, were it not that the dirty farming prevailing in so large a part of the kingdom seemed to set this truism at defiance. On drained land weeds are easily eradicated or killed; and if this be once done effectually there will not be much trouble in the matter afterwards. A proper rotation of cropping will attain what is here wanted, with ease and advantage; the introduction of the green crop system has much facilitated this operation. The old fallows being now discontinued on almost all lands, a well worked crop of Turnips or Beans will equally serve the purpose of ameliorating the soil by frequent turnings, and perhaps keep it clearer by the overshadowing they create than can be done by its being baked even by a hot sun, and much better than with a sunless sky. It is too often supposed that the clean green crop named is all-sufficient for effecting the purpose alluded to, and that the corn crop following may be left to itself, but this may be considered a great error. There can be no reason why a crop of corn should not be kept just as clean as a crop of Turnips, and modern inventions have so facilitated this matter, that there can be no excuse for bad farming in this particular. If the corn crop be grown in drills (and there certainly can be no pretensions to the higher order of farming without drilling), by the use of Mr. Garrett's horse-hoes, and followed by Dr. Newington's hand-hoe cultivator, the land may, with little trouble and expense, be kept perfectly clean and friable. This brings us to the 3d section, that of tillage, which is perhaps about the most important of the whole. Nothing can show more the low state of farming in general in this country than this very process. The drill system was invented more than a century ago by Jethro Tull, yet at the present time in many parts it is not practised; in others it is not even understood. The object of this is not only to give such an equal distribution of the seed in sowing that each root may have its proper share of nutriment from the soil, but, by the plants being grown in rows, a clearer space is given for working the soil, by which it is not only rendered more friable for the spread of the fibres, but it is cleaned from the superfluous growth of weeds. This friable state of the soil is not only required near the surface, but by deep stirring must give ample room and facilities for the roots to shoot their fibres to the extent they will do under favourable circumstances. The high authority already quoted considered that one or two ploughings were good, but a third ploughing better, and a fourth best of all, as it was by the extreme diminution of the different particles that he was able to grow good crops of Wheat (more than 30 bushels per acre), for 12 years running on the same soil without an atom of manure. This brings us lastly to the fourth part—making land rich. And here, though it may be possible to grow successive corn crops without manure, yet no one will deny that by judicious management and the application of suitable manures, the bulk and goodness of the crop may be greatly increased. Infinitely more attention is now paid to this branch of farming than it used to be formerly. The farm-yard and buildings are better constructed. Much of the old system of constantly turning out the cattle is by degrees wearing out, and more dung and of a better description is made. The Turnip culture has greatly contributed to this, as, if green crops be raised, it is in most cases indispensable that cattle should be kept to consume them. The profits of a farm are perhaps chiefly dependant on the quantity of dung made and at command, as, though in bad farming much of it may be either wasted or misapplied, yet in that of a superior order the crop, be it green or grain, may be so forced and increased by the application of rich fertilisers as to put three or four times the money into the farmer's pocket, that could be done without it. The discovery of guano has been highly favourable to the farmer's profits; about 3 cwt. of this, costing about 30*s.*, will go as far towards raising a good crop of Turnips as perhaps 10 or 12 tons of dung. Bones with sulphuric acid have been found still more economical than guano. There are also a number of artificial manures composed of various ingredients, which at least profess to be cheap and useful. Soot, too, which may be bought near the large towns at 2*d.* the bushel, is an excellent stimulant, and when mixed with different alkali, will force a quick and luxuriant growth in most plants. The different processes now named should be the chief objects aimed at by every farmer, who wishes to make his pursuit not only creditable to himself, but profitable as a pecuniary investment. Some splendid specimens in this line have been lately exhibited, and it has been proved from undoubted authority, that the profits arising from it are such that they may be made to counteract many of the disadvantages under which the farmers labour at the present time. At all events, if high farming will not answer, low farming never can. If 40 bushels of Wheat (not an exaggerated quantity) are grown, where only 20 bushels (a very common quantity) were grown before on an acre, it is not saying too much that this will amply counterbalance the present fall of prices. By an improved system the greatest benefit will accrue both to landlord and tenant, but to be going on in the old beaten track, and to neglect the opportunities which science, combined with capital, holds forth to an enterprising spirit, must be ruinous to both. It therefore becomes the duty, as it is the interest, of the landed proprietor, to give encouragement to modern improvements, and by co-operating with tenants of intelligence and ability to work out the four processes here described, and thus bring his undertakings to a successful termination. *Law. Rawstorne, Penwortham, May* 15.

Garden Allotments.—Having for 15 years let garden allotments to the poor of a parish of about 600 inhabitants, I offer the following answers to the questions of "R. G.," in your Paper of May 4. The amount of land let out—5 acres. Let at 4*d.* per pole, not including footpaths. The quality of the land when first let out—a foul and neglected condition. Its present quality—a high state of cultivation. The system works well for the poor. The system was introduced about the time of the new Poor-law; though I have no answer to this and the following question, I have been often told that the allotments have prevented many from going into the workhouse. A tenth part of an acre is allotted to each family, in some few cases a little more or less, but this quantity is deemed sufficient. The question as to the number of labourers out of employ cannot be satisfactorily answered from local circumstances. The farmers made no opposition to the introduction of the system, though they were not in favour of it. The farmers now approve of it, and regret was expressed by many, when, at one time, there was a prospect of the land passing into other hands and being otherwise occupied. The moral tendency, though not easily defined, may be assumed to be good. The rule that only half the land be cropped the same year with Potatoes, is found to promote good garden cultivation; no corn is allowed to be sown. *J. C. C., May* 10.

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND

A WEEKLY COUNCIL was held at the Society's House, in Hanover-square, on Wednesday, the 29th of May: present, the Earl of CHICHESTER, V. P., in the chair; Lord Camoys; Sir Charles Lemon, Bart. M.P.; Sir James Ramsay, Bart; Sir Robert Price, Bart. M.P.; Col. Austen; Mr. Raymond Barker; Mr. Burke; Mr. W. Clavering; Mr. Pendarves, M.P.; Mr. P. Severn, and Mr. Richard Trench.

The following new members were elected:
Carter, Thomas, Scales, Richmond, Yorkshire
Collins, Rev. C. M. E., Chudleigh, Devon
Morris, Thomas, Maisemore, Gloucester
Savery, John, Silverton, Exeter
Bingham, Richard, Binghams, Melcombe, Dorchester
Ley, Henry, Ley House, Mamworth, Devon
Chetwynd, Viscount, Teignmouth, Devon
Tucker, John, Morehard-Bishop, Crediton
Walker, Samuel, Barn Park, Teignmouth.

The names of 39 candidates for election at the next meeting, were then read.

MISCELLANEOUS COMMUNICATIONS.—Result of trials to naturalise Thibet sheep in Wales, from Mr. C. R. Mansel Talbot, M.P., and information connected with their natural history, from Colonel Sykes.—Letters from Mr. Curtis, expressing his opinion on the character of insects destructive to the Wheat and Potato crops, transmitted by Mr. Fisher Hobbs and Colonel Napier.—Suggestions from Mr. G. Robinson, of Wolverhampton, for papers on feeding sheep and pigs, and on crops, to be adopted on the failure of Turnips.—Copy of resolutions passed at the Botley and South Hants Farmers' Club, on questions connected with land-drainage, from Mr. W. C. Spooner, the secretary of that club.—Letter from Mr. Drake, on the mottled and white-faced Hereford cattle.—Letter from Mr. Brutton, reporting the local advantages offered at Exeter, for the trial of H. R. H. Prince Albert's plan of arresting the progress of sewage matter, and converting it into manure for the land.—Copy from Mr. A. Castellian, of Liverpool, of M. Hamoir's details, connected with the extraction of sugar from the Beet-root.

The noble Chairman and Sir Robert Price favoured the Council with interesting local information, connected with the history of the breeds of Southdown sheep and Hereford cattle, respectively; and with the change of taste, at different periods, in the preference given to particular varieties by breeders, on account of certain occurrences of colour or conformation, supposed by them to indicate excellence.

WHEEL-AXLES.—Mr. LEE, C. E., of 103, Long Acre, had leave to exhibit to the Council his axle and wheel, intended, by the arrangement of its double action, to prevent the injury sustained by ordinary axles, when subjected to the sudden jerk occasioned by a casual obstacle to the progress of the wheel; by the mode in which lubricating matter could be applied and retained for a long period, in contact with the parts liable to friction, to promote freedom and uniformity of motion; and, by the simplicity of its fastenings, to make the putting on, or taking off, of the wheel, the work only of a moment. Mr. Lee stated that the expense of this construction of axle, applied to agricultural vehicles, would be very little greater than that of the ordinary axles at present in use. The Council gave no opinion on the invention submitted to them, but thanked Mr. Lee for the trouble he had kindly taken in bringing it before their notice, and explaining to them its peculiarities of construction.

PRESENTS.—Among the numerous presents made to the Society were the following:—Treatise on Poultry, from Mr. Nolan, of Dublin; Transactions of the Royal Asiatic Society, and the Yorkshire Agricultural Society; Prize List from the Manchester and Liverpool Agricultural Society; and Reports from the Royal Institution of Great Britain, and the Athenæum Club.

A MONTHLY COUNCIL was held on Wednesday last, the 5th of June:—present, the Marquis of DOWNSHIRE, President, in the chair; Earl of Lonsdale; Viscount Hill; Lord Bridport; Lord Portman; Hon. R. H. Clive, M.P.; Hon. W. G. Cavendish, M.P.; Sir Thos. Dyke Acland, Bart., M.P.; Sir Matthew White Ridley, Bart.; Sir Charles Lemon, Bart., M.P.; Sir Robert Price, Bart., M.P.; Mr. Raymond Barker; Mr. Bramston, M.P.; Mr. Brandreth; Mr. Burke; Colonel Challoner; Mr. Evelyn Denison; Mr. Garrett; Mr. Brandreth Gibbs; Mr. Gould, of Poltimore; Mr. Fisher Hobbs; Mr. Lawes; Mr. Kinder; Mr. Neill Malcolm; Mr. Miles, M.P.; Mr. Milward; Mr. Pendarves, M.P.; Mr. Pusey, M.P.; Prof. Sewell; Mr. Shaw, of London; Mr. Villiers Shelley; Mr. Sillifant; Mr. W. Simpson; Mr. Stansfield, M.P.; Mr. Turner, of Barton; and Prof. Way.

Edward Ludd Betts, Esq., of Preston Hall, Maidstone, was elected a Governor of the Society.

The following new members were elected:
Riccard, Russell M., Southmolton, Devon
Thomas, John, Cholstrey, Leominster
Fisher, Rev. John Campbell, Harpford, Sidmouth
Wright, Richard, Field Bank, Macclesfield
Pennell, Richard Lewin, M.D., Exeter
Overell, John, Aspenden, Buntingford
Webb, Richard Anthony, Oxton, Exeter
Owen, William, Rotherham, Yorkshire
Howard, James, Alphington, Exeter
Mackay, Thomas Henry, jun., Petham House, Canterbury
Merson, Richard, Brinsworthy, Northmolton, Devon
Monday, John, Staplegrove, Taunton
Croote, G. H., Crooke, North Tawton, Devon
Sidney, John, Wolaston, Wolverhampton
Prickman, Thomas, Broadnymet, North Tawton, Devon
Fryer, William Fleming, The Wergs, Wolverhampton
Norrish, Samuel, Horwell House, Colebrooke, Crediton
Moorsom, Capt. W. S., Great George-street, Westminster
Wills, George, Whelmstone, Colebrooke, Crediton
Sedgwick, Rev. Leonard, Lathkirk, Middleton-Teesdale
Wreford, Samuel, jun., Grattan, Crediton
Douglas, James, Athelstan-ford, Drôm, Haddingtonshire
Drake, Charles, Cutcliffe, Springfield, Barnstaple
Dunn, Colonel, R.A., Denford House, Hungerford
Kinneir, Richard, M.D., Livingshays, Silverton, Collumpton
Dewe, William, Westleigh House, Bideford
Brown, William Williams, Allerton Hall, Leeds
Mogridge, Richard, Molland, Southmolton
Wainwright, Chas. Rawlinson, Shepton-Mallet
Paramore, J. Rawle, Southmolton, Devon
Ward, John, Donnel Farm, Whittington, Oswestry
Karslake, Rev. W. Heberden, Mesham, Southmolton
Kennedy, Rt. Hon. Thos. Francis, Dunure, Ayrshire
Quartly, John, Champson-Molland, Southmolton
Campbell, Sir Alex. T. C., Bart., Newton House, Barnstaple
Harness, Thomas B., M.D., Tavistock, Devon
Badcock, Henry, Taunton, Somerset
Winter, John, Ash-Priors, Taunton.

The names of 10 candidates for election at the next meeting were then read.

FINANCES.—Colonel CHALLONER, Chairman of the Finance Committee, laid before the Council the report on the accounts of the Society to the end of the previous month; from which it appeared that, on the 31st of May, the current cash-balance in the hands of the Bankers was 2493*l*. The Chairman explained that this general balance included 1260*l*. as the Exeter subscription, and 210*l*., as the amount received on account of life-compositions, to be invested; leaving a balance of 1023*l*. available for current purposes. The Chairman added, that the arrears of subscription remaining unpaid were in due course of recovery, by means of the County Courts, agreeably with the instructions of the Council.—This report was adopted.

PRIZE ESSAYS.—Mr. PUSEY, M.P., Chairman of the Journal Committee, reported the further awards made by the Judges of Essays; and the motto-papers being laid before the Council, the following result was declared:

I. The prize of 50*l*. for the best Report on the Farming of Lincolnshire, awarded to JOHN ALGERNON CLARKE, of Long-Sutton.—The judges "highly commended" the essay, in the same class, bearing the motto "Hope."

II. The prize of 20*l*. for the best Essay on the Rearing and Management of Poultry, awarded to WILLIAM TROTTER, of Healey Mill, Stocksfield, near Gateshead, Durham.—The judges "commended" the essay, in this class, bearing the motto "Dorset."

Mr. PUSEY, M.P. having passed his high opinion on the great value of the two Lincolnshire Essays, then brought before the notice of the Council, Mr. Miles, M.P. expressed his regret that there was at the disposal of the Journal Committee no second prize, by which they might have had it in their power to mark their estimation of the peculiar value of the second Essay, which the judges had highly commended. Having himself had the pleasure of reading both the Essays, he could say, that although the prize was justly due to the first Essay, it happened in a remarkable manner, that its deficiencies were just those topics which in the second Essay were so fully and admirably treated: so that, great as were their respective merits, neither of them was complete without the other; but by an amalgamation of the two, the most perfect Essay might be produced that had ever appeared in the Journal on that subject, or any other. He made these remarks with confidence, having been for so long a period well acquainted with the peculiarities of Lincolnshire farming, as well as with its progress and present condition. He hoped the talented author of the second Essay, bearing the motto "Hope," would allow acknowledged notes to be added from his own Essay to that of Mr. Clarke, when it should appear in the Journal, in order that the report on Lincolnshire farming might be rendered complete. The Council concurred with Mr. Pusey and Mr. Miles, in hoping that the author would allow this second Essay to be published.

ESSAY PRIZES FOR 1851.—Mr. PUSEY then submitted to the Council the schedule of prizes for the Essays and Reports of next year, the following subjects and respective amounts of which were discussed and agreed to; subject to such conditions of competition as shall be published in the ensuing prize-list of the Journal, and to the Essays being sent to the Secretary at the house of the Society, on or before the 1st of March, 1851:—namely,

Farming of Shropshire	£50
Farming of Northamptonshire	50
Diseases arising from the mismanagement of horses	20
Diseases of Cattle after parturition	20
Agricultural Geology of England and Wales	50
Production of Butter	10
Any subject in Agricultural Chemistry	20

Mr. FISHER HOBBS then called the attention of the Council to the desirableness of attracting public consideration more strongly to the application of steam and other motive power to the purposes of agriculture; and an interesting discussion ensued. Mr. Pusey agreed with Mr. Hobbs on the importance of this question, and the only doubt he felt on the adoption of any means taken to procure an Essay for the Journal, was the interference it might occasion with the objects of the stewards of implements, who, at the country meetings of the Society, only allowed prizes to be awarded after actual trial of the practical value of the implements entered for competition.—Colonel Challoner thought, that where a steady uniform draught was required, as in the use of the windlass, and in the case of the mole and draining ploughs, horses might be much more advantageously employed than they had hitherto been.—Mr. Miles and Mr. Pusey referred to Nottinghamshire and other counties where draining ploughs had been drawn by means of a moveable windlass.—Mr. Garrett could bear his testimony to the great interest felt very extensively at the present moment on the application of steam-power to agricultural purposes. The minds of many men were actively on the alert to devise means by which steam power could be best adapted to the requirements, not only of ploughing, but of other field operations; and many patents having in view the accomplishment of these important objects, were now in the course of enrolment. No new engine or new power was required, but simply the adaptation of the present steam-power. Mr. Hobbs's suggestion he thought a very good one, and well-timed; for two years ago it would have been premature, two years hence it will be too late. With regard to horses, Mr. Garrett thought it should be borne in mind that the horses on a farm consumed one-fifth of the whole produce of the land, while steam-power would call manual labour and human superintendence into extensive requisition. He conceived that an essay expounding the possibility and advantages of the adaptation contended for, would lead the way to the actual construction, exhibition, and trial of the agricultural engine so much desired.—Mr. Shelley considered, that with reference to motive power, that of water was not to be neglected where it was to be had. With regard to steam-power, he had himself employed it largely, and to his great benefit, for the last two years, and the commonest labourer could manage it. He believed that nothing would so much tend to set the farmer on his legs as the adoption of steam-power, and the efficiency and economy with which its application was in every case attended. He had, however, great difficulty in getting his neighbours to look at his own arrangements, much less to get them to adopt them. He therefore hoped that such a prize-essay as Mr. Fisher Hobbs proposed would reach the eye of farmers, and tend to convince them of the opportunities within their reach, but which they had neglected. He thought the Council owed their best thanks to Mr. Hobbs for having brought forward the proposition.—Mr. Shaw, of London, fully concurred in the desirableness of the prize proposed. We were not yet aware of the extent to which steam may be applied, nor the consequent amount of advantage to be derived from its means to the practical farmer. He conceived that a statement of the present application of steam on the one hand, and its prospective applications on the other, to agricultural purposes, would prove of the highest value.—Mr. Pusey concurred in the general opinion of the Council, that such a prize would not interfere with the operations of the country meetings, but in a great degree tend to promote them, by detailing the various modes of applying steam-power to farm operations, and proving its advantages, by showing its economy; he had therefore much pleasure in seconding Mr. Fisher Hobbs's proposition. It was then carried unanimously, "that a prize of 30*l*. be offered for the best essay on the relative advantages of steam and other motive powers, applicable to agricultural purposes," to be sent to the Secretary, at the House of the Society, on or before the 1st of March, 1852.

EXETER MEETING.—Lord PORTMAN laid before the Council the Report of the General Exeter Committee, which was unanimously adopted. The points to which it had reference were the following:

1. Preparations for the Pavilion Dinner.
2. Contracts for the Pavilion and Show-yard.
3. Lecture requested of Professor Simonds: "On the Structure, Functions, and Diseases of the Liver in domesticated animals," to be delivered in the Athenæum at Exeter, at 6 p.m., on Wednesday, the 17th of July.
4. Awards of prizes in the classes of Cattle to be read at the conclusion of that Lecture.
5. Sale of tickets to members only during that day from 10 a.m. till 6 p.m., and on the Thursday to members and any of their friends, from 8 a.m. till 3 p.m.

Mr. SHELLEY thought the Society was so much indebted to those railway companies who so liberally lent the aid of their extensive opportunities to promote the great objects of the Society at its country meeting, that he would desire the Secretary to report to the Council the present state of his correspondence on that subject. The following is accordingly the list of the companies who, up to the present time, have, in the handsomest manner, granted concessions to the Society's exhibitors at the Exeter Meeting; namely,

Bristol and Exeter Railway—Chester and Holyhead Railway—Cockermouth and Workington Railway—Eastern Counties Railway—Great Western Railway—London and South Western Railway—London, Brighton, and South Coast Railway—Manchester, Sheffield, and Lincolnshire Railway—Shrewsbury and Chester Railway—South Devon Railway—Stockton and Darlington Railway—Stockton and Hartlepool Railway—Taff Vale Railway—York, Newcastle and Berwick Railway.

The Secretary was in communication with the remaining railway companies, and there was no doubt that they would, in the same liberal and enlightened spirit, renew their former concessions for promoting the success of the Society's country meeting at Exeter this year.

JUDGES.—Lord PORTMAN reported progress that the judges' committees were in active communication with the parties whom they had decided to recommend as judges at the Exeter meeting.

MEETING OF 1851.—Lord PORTMAN also reported, on the part of the Inspection Committee, that H.R.H. the Duke of Cambridge, as Ranger of Hyde-park, had in the most gracious and condescending manner expressed the satisfaction it gave him to place at the disposal of the Society, for the show of breeding stock in 1851, that part of Hyde-park near Kensington-gardens, which lay between the Serpentine River and the Victoria Gate in

the Bayswater-road.—The Council expressed their satisfaction at this additional instance of His Royal Highness's interest in the Society, and his appreciation of the value of its public objects.

COGGESHALL: *Steam-power in Agriculture.*—Mr. Mechi lately gave a lecture on this subject before the Mechanics' Institution here; he said—I need hardly say that steam will do on a farm that which horses cannot do. I must now descend to the dry details of first cost and daily expense of my own six-horse power steam engine, and the uses to which it is applied, because I know too many of my practical friends have considered or believed Mr. Mechi a visionary theorist, or crazy enthusiast in agriculture; but time (aided by a certain number of goodly stacks) is working changes of opinion; and I would advise certain folks to look after their laurels, for the physic of sound theory is beginning to operate at Tiptree Hall Farm—(laughter)—as the forthcoming crops promise most abundantly to illustrate. In another century it will scarcely be credited that in this great agricultural county, of one million of acres, there could not be found half-a-dozen agricultural steam engines! indeed, it is only recently that steam power is being gradually applied to our county corn mills; so that if we depended on meal for our stock they would alike be subjected to starvation by a long calm, a heavy flood, or a dry summer. Having adverted to the drainage of the Bedford Level as one of the great benefits already derived by agriculture from steam power, the lecturer proceeded—There is no doubt but ultimately we shall avail ourselves of steam for irrigation in our warm and dry districts, and that it will ultimately be applied to the working and stirring of the soil; already many experimental trials have taken place. One thing is certain—that the general application of steam power in cultivation will necessitate such a squaring and levelling and re-parcelling of the soil as will thoroughly reform the hedge-and-ditch-row-ism and topography of this kingdom. (Laughter.) It will equally compel a re-adjustment of the system of transfer or exchange of land, which should change hands as easily as the 3 per cents. A farm of 600 acres should represent a square mile with a farmery in its centre, having half a mile diverging roads to its extremities; whereas now, under the system of old custom and unalterability, a farm of that size generally involves the intricate threadings of miles of almost impassable green and muddy lanes, with fields of every form except the right one. A difficulty has hitherto been experienced from the scarcity of engineers; but two working young men, of ability and experience (Messrs. Stiffler and Algar) having located themselves at Kelvedon, myself and others have found their services truly valuable; and if they succeed, great will be the advantage to this neighbourhood, since the good going of an engine, like that of a watch, depends not only on the skill and ingenuity of its original maker, but also on the ability of those employed to repair it when out of order. I am enabled to form a correct comparative estimate of the relative power of horses and steam, because, unfortunately, my first attempt was with six real horses—the remembrance of that great mistake awakens many unpleasant and unprofitable reflections. (Laughter.) The mere working space required for the six horses is three times as great as that necessary for the engine and boilers—to say nothing of the stalls, attendance, and food. If a steam-horse costs only 25*l.*, it is quite clear that it is in first cost, power, maintenance, and durability, more advantageous than a real horse; besides, if you feed it well with coals and water, you may work it all night as well as all day.

	£	*s.*	*d.*
First cost and outlay of my own 6-horse power engine, best wrought boiler	150	0	0
Fixing shaft, brickwork, &c.	70	0	0
Pair of mill stones, gearing, and miller's tools ...	50	0	0
Turner and Harwood's linseed crusher and gearing...	15	0	0
Pump and gearing	15	0	0
Sack tackle and gearing	10	0	0
Threshing machine and gearing, shutters, &c. ...	50	0	0
Dressing machine and gear	20	0	0
Chaff-cutter and gearing	20	0	0
Grindstone and gearing	10	0	0
	£410	0	0

I believe Messrs. Stiffler and Algar would undertake the whole for a much smaller sum; but of course the cost must vary in some degree with the buildings. For a small additional cost, I could, if necessary, drive an extra pair of stones.

Daily Charge.	£	*s.*	*d.*
Coals	0	10	0
Wages of man as miller and engine-driver	0	3	4
Sperm oil, rags, candles, packing, &c.....	0	0	6
Wear and repairs to engine, &c.	0	1	6
	0	15	4
Interest of capital, 400*l.* at 5 per cent.	0	1	4
	£0	16	8

Daily Work Done. (Charged at the price we should have to pay in the regular way, independent of cartage to mill, &c.)	£	*s.*	*d.*
Seven quarters of corn ground	1	1	0
130 bushels of chaff cut one-eighth of an inch long (less woman's time 7*d.*)	0	3	6
Miller's toll saved, 4lbs. per sack, is 56¼ lbs.	0	3	6
Linseed crushed, water pumped, sacks raised, grindstone turned, water boiled, food steamed.....	gratis.		
	£1	8	0

Deducting expenses as above, this gives a daily profit of 11*s.* 4*d.*, and the work done by the engine is more than ten horses could accomplish. But even if, instead of 11*s.* 4*d.* daily gain we only conducted our business at the ordinary cost, still there would be an immense convenience in being able to do everything in our own way and at the right time, without cartage to mill and the uncertainties of supply.

Cost of a Day's Threshing.	£	*s.*	*d.*
30 quarters of long mowed Wheat (or 40 quarters of reaped ditto) threshed, dressed, and sacked up in eight hours. This would cost in addition to expense of the engine given above, viz.....	0	16	8
Wages of seven men at 1*s.* 6*d.*.....	0	10	6
Three women and three boys at 8*d.* each.....	0	4	0
	£1	11	2

Or 1*s.* per quarter for the mowed and 9*d.* per quarter for the reaped Wheat. The engine would do more, but these quantities are as much as a good man can pass through his hands in the time. Having thus disposed of the statistical part of the question, I may observe that steam will have the effect of abolishing or diminishing the extent of land in Grass. The facility of cutting straw into chaff, and grinding corn into meal by steam power, will convince landlords and tenants too that the poor Grass lands will be more advantageously converted into good corn and root growing arable land. The Scotch system of two years Grass for rest will naturally give way to the improved method of obtaining abundant manure by purchased corn on boarded floors, or under sheds. My daily consumption of chaff is more than 130 bushels. If, by any mischance or repair, the engine is not at work for a few days, great is the outcry for its use. Everything seems out of joint without it. But on what sized farms can steam be advantageously used? Here I am sure I shall differ most widely from the majority of landlords and of tenants of the present day. Before I answer the question I should ask, what amount of live stock per acre do you mean to keep? If you determine to keep, as I do, 4*l.* to 5*l.* worth of live stock per acre, you will require a steam-engine on a farm of 130 to 200 acres varying in power from four to six-horse. Mine of six-horse power finds ample employment on a farm of 170 acres. In fact, as I extend my accommodation I shall increase my quantity of live stock, being convinced that on this depends the increased fertility of our soil. It may be said, "If everybody did as you do meat would be very cheap." I can honestly assure you there is no fear of everybody doing so; prejudice, or want of capital, both by landlords and tenants, will be an effectual bar to its general and immediate extension; but the sooner we begin the better, for it is quite clear that even in this well-cultivated county we are a desperately long way from perfection. It has been urged that the employment of steam power displaces manual labour. However specious this objection may appear, it is not founded in fact, because the same principle of profit and economy that would induce an agriculturist to employ steam would also cause him to drain and subsoil his land, open his ditches, square his fields, trim his fences, mend his roads, burn earth, cart chalk, keep his lands free from weeds, and do many things that tend to the increased employment of labour. Besides the making of a steam-engine is nearly all labour, except the mere iron ore obtained by labour. Thousands of labourers are rendered permanent and premature paupers by the slavery of agriculture—I mean threshing and chaff-cutting. These operations are generally paid for by the piece, or task work. The result is over-exertion, a short cough, asthma, pain in the side, or some permanent disability. I see too many instances of this kind. Steam power would prevent them. In conclusion, I recommend the use of steam-engines in agriculture—1st, on the principle of humanity, as improving, by the cheapening and increase of food, the physical, moral, and social condition of the working classes; secondly, on the score of economy and profit, individual, parochial, and general; thirdly, on the ground of providing food and employment for our mechanical engineers and miners, rather than for our horses; and last, though not least, as the basis for promoting the honour and safety of the nation, by increasing the number of hardy tars to navigate our coal laden vessels, or, if need be, to man and defend

"Old England's wooden walls."

In answer to a question from F. U. Pattison, Esq., Mr. Mechi said he employed eight horses on his farm, but thought he could do with six. Mr. Pattison considered eight horses amply sufficient upon a farm of 170 acres without a steam-engine, so that no saving was shown in that respect. Mr. Mechi said it was the opinion of his bailiff that it released two horses, besides which it should be recollected that by subsoiling and deep cultivation he used more horse power than many of his neighbours. The discussion also turned upon the amount of corn which the engine would grind in a day of 10 hours, in which Mr. Stiffler stated that Mr. Mechi's calculation of 15 sacks was a small quantity, he having seen a sack of Barley ground by that gentleman's engine in 20 minutes. As to the durability of engines, Mr. Mechi quoted a statement of Mr. Garrett, that one he had had in use 12 years was in as good order as at first. In this respect he was corroborated by Mr. Hall, of the Coggeshall silk factory, who mentioned that an engine which he bought second-hand, used 20 years, and which had since been used for a similiar period by the person to whom he sold it, was now as good as ever. Mr. Swinborne (isinglass manufacturer) referred to Mr. Mechi's estimate of 1*s.* 6*d.* per day for repairs, observing that in his experience, although his engine had broken down three times from being over worked, it had not cost so much as that. He for one should be very sorry to return to horse-power.

Mr. Pattison, after again adverting to the small saving of horse-power, proposed a vote of thanks to Mr. Mechi, observing that he was always pleased to see him and to look over his farm. He never met Mr. Mechi without a smile, and it did one good to see him. (Laughter and cheers.) *Essex Standard.*

Farm Memoranda.

STANTON, NEAR BAKEWELL.—"The farm now occupied by W. P. Thornhill, Esq., at Stanton, was previously occupied by a tenant, and on his leaving the same Mr. Thornhill took it into his own hands, and set about improving this farm in earnest by giving a thorough drainage of the land where wanted; at the same time trenching or double digging a great portion of the land. In this important operation, which must be at the foundation of all good husbandry on wet lands, complete success has been the result, the water being carried off by the drains—the land being thus brought into a fit state for the growth of root crops. The next improvement was (the farm being full of old crooked fences, and the fields small in proportion to the size of the farm) to take down, remove, and rebuild in straight lines the wall fences; the fields thus having been very much enlarged, appear to be well proportioned to the size of the farm. Rotation of cropping—the four course system is practised. First year, Mangold Wurzel, Swedish and other Turnips. Second year, Wheat, Oats, or Barley, principally Wheat. Third year, red Clover with an admixture of Rye-grass, cut twice, first time for hay; second, hay and the milk cows. Fourth year, Wheat and Oats. The root crops sown on the ridge, 27 or 28 inches apart, manured principally with farm-yard dung, with an addition of 1½ cwt. of guano to the acre. A large breadth of Mangold has also been grown this season, the crop exceedingly heavy: a great proportion of the Mangold top is spread on the stubbles to be ploughed in. The Turnips are drawn off, to be consumed by cattle in the yards. Forty-eight acres of root crops have been grown this year. A great breadth of artificial Grasses were annually grown on this farm; quantity of seed sown per acre of red Clover, 11 lbs. of red Clover, with two pecks of Rye-grass, sown with the Grass seed drill; the whole of the grain crops put in with the drill. Judging from the appearance of the stubble and stack yard, which is large, and filled with stacks of considerable magnitude, notwithstanding the stack yard is inadequate to contain the whole of this year's produce, one large stack being built outside, we have no hesitation in saying the grain crop on this farm the last season was not of an ordinary but most extraordinary character for quantity, as large as can be profitably grown. A large dairy of cows are kept on the farm of a really useful description, for both milking and grazing; upwards of 30 calves are annually reared; thus, with the milking cows, two years and yearling heifers and bullocks, a great number of cattle is regularly kept on this establishment; the farm horses are in the stable all the year; in the summer season they are fed on Vetches, Italian Rye-grass, &c. Mr. Thornhill has an annual sale of fat and store stock. A considerable portion of oilcake is consumed by the fat stock; the enriching qualities of which in the manure, together with the great quantity of manure made on the farm, is the grand secret, with skilful management, in the production of those great crops before referred to. The buildings at the farmery have been much extended to accommodate the cattle. In all the improvements made on this farm, we do not discover that there has been any unnecessary or fanciful expenditure of capital; the object steadily kept in view by Mr. Thornhill being, that in every addition or alteration made, they should be of the character to pay. We are decidedly of opinion that the system of farming pursued on this farm is highly meritorious, and worthy of imitation by every tenant farmer occupying land of a similar character. As Mr. Thornhill has kindly permitted the public to inspect his farm, we promise those who do so, and who take pleasure in farming operations, a gratification rarely to be met with. The people in the neighbourhood must be deeply indebted to the owner and occupier of this farm for annually expending so large a sum of money in labour. On the south-east side of the farm in question, we were shown by the bailiff a tract of land that may be called an appendage to the farm before referred to. This tract of land is of considerable extent, having a most uneven surface, a great portion of it covered in a great measure with large stones; in its natural state almost valueless. This portion of the estate is, by the expenditure of a large amount of capital, being brought into a state of cultivation, and made to grow Potatoes, Turnips, and excellent crops of Oats. We cannot but regard Mr. Thornhill, not only as a most spirited agriculturist, but a true benefactor to his country in creating a vast amount of employment for the labouring classes, and thereby producing an increased quantity of food for an increased population. PETER P. FIDLER, BENJAMIN SWAFFIELD, and WILLIAM WAYER," (a committee of the Bakewell Farmers' Club). The above report has evidently been drawn up with much care by the committee, but there is one important fact which has been overlooked—the manner in which liquid manure is applied, so that two crops of seeds can be cut twice every year without detriment to the land; this omission we are happy in being enabled to supply. The seeds are top-dressed twice each year before each cutting, the first time with 2000 gallons, and the second time with 1500 gallons of liquid manure; and the system pursued by which 30 acres of seeds are manured in this manner twice every year is this:—a liquid manure tank is sunk under the whole of the farm-yard, and arched over; this tank holds 95,000 gallons of liquid manure, which is caught during the five months that 150 head of cattle are tied up, and also the liquid

of between 50 and 60 pigs during a whole year. It is by these means that 30 acres of seeds are enabled to be manured twice every year, yielding a crop the first time of cutting at the rate of 2 tons of hay to the acre, and 30 cwt. per acre at the second cutting. The first top-dressing is applied about the middle of April, as soon as the seeds begin to spring, at the rate of 2000 gallons per acre; and the second application of 1500 gallons per acre is made as soon as the first cutting is carried off the ground. One of the great benefits which the ground derives from such a top-dressing of liquid manure every fourth year is, that it is now entirely free from the ravages of the wireworm; before it was applied the crops suffered greatly in this respect; the ammonia from the liquid manure is fatal to the wireworm. *Chesterfield Gazette.*

Reviews.

Treatise on the cultivated Grasses and other Herbage and Forage Plants; with the kinds and quantities of seeds recommended for sowing down land to alternate husbandry, permanent pasture, lawns, &c. By Peter Lawson and Son, Seedsmen and Nurserymen to the Highland and Agricultural Society of Scotland. Third Edition.

WE cordially recommend this work to those of our readers who are interested in the improvement or formation of Grass lands. A new edition, prepared most carefully, has been issued at a time when advice and instruction on the subject treated of seem most in demand. A number of useful tables are given, stating the kinds and quantities of Grass seeds required for sowing an imperial acre in the cases of alternate husbandry and permanent pastures under various circumstances—as for fields, lawns, water meadows, &c. We have no doubt they will be found highly useful.

Seed List. By John Sutton and Sons, Reading, Berks.

WE refer to it here in commendation of the very detailed statement of prices which it gives. About 50 different kinds of Grasses are specified, and their present prices named—a matter of great convenience to any who may wish to determine the cost per acre of any recommended mixture.

Miscellaneous.

Roots choking Drains.—In a recent case, where some Poplar and Larch trees stood about 16 to 18 feet from the line of a main drain, laid through a field, it was found that in two years the drain had become choked with roots; and it is believed that in many instances where drainage has not produced those improvements in land which were anticipated, and even where hedge-rows cross or adjoin any portion of a main drain, the cause may be an obstruction of this nature. In the case quoted, however, the precaution of placing vertical pipes at the junction of each of the parallel drains with the main aided greatly in pointing out the cause. The drains in this case are said to have been made of horse-shoe tiles, well laid, and fitting closely at the joints. *From the Builder, May* 18.

Calendar of Operations.

JUNE.

BEDFORDSHIRE, *June* 3.—The weather for some time past has been alike favourable for the operations of the field, as for the growing crops. Every description of crop looks well now, and Turnip sowing is well advanced. We have about half our "Swedes" sown, and shall be likely to finish in another fortnight. We can sow three acres a day, with seven horses, seven men, and six boys; one man ridges up the land for the dung with two horses; three men fill to three carts; one boy drives the intermediate cart; one man lays down the dung; one man and five boys spread; and one man with two horses covers it in. We sow on the flat in some instances, and prefer doing so after Tares, or any other green crop, which leaves a portion of refuse, which is most useful under the furrow, and prevents the due preparation of the land for the ridge system, by repeated ploughings. We think Tares never ought to be sown on land intended for Turnips, unless well dunged in the autumn. The crop of Tares is thereby increased, and the land, after the crop is consumed, is in good preparation generally with one ploughing. There is no loss of labour then, nor loss of moisture from the soil by stirring it about in hot weather to make it firm enough for the Turnip seed. We have upwards of 120 acres of green crops this season, and 22 acres have grown, and are growing one crop which will shortly be succeeded by another. We expect to have the greatest part of the Turnips sown before hay-making commences, and always endeavour to have all other kinds of labour as forward as possible, that the hands may be concentrated. The Potatoes have received their first hoeing, and the Mangold Wurzels will soon be ready for hoeing also. The horses are now living upon Tares, a bushel of Oats, and a bushel of rice meal each per week. The sheep are chiefly living upon Tares; and 40 cattle in yards and houses. The cattle have some Clover hay and Wheat straw cut into chaff, and mixed with the cut Tares. They appear to thrive very well, and make a good deal of manure. No system of management however, we know of, an be remunerative with present prices for marketable ommodities, while the general expenses remain as they are. *R. V.*

Notices to Correspondents.

AGRICULTURAL SHOW AT GLASGOW: *Forward.* It will take place on the last day of July and the 1st and 2d of August.

CHURN: *B, Lymington.* The tin becoming smeared with the butter is not any consequence of the metallic surface; but it is owing to the cream and butter being warm and soft. Fill the vessel in which the churn is placed with as cold water as possible.

CORN-LAWS: *J B—J N.* If you would favour us with your address we could explain satisfactorily.

GRASSES, &c.: *Inquirer.* 1, Festuca ovina; 2, Poa pratensis; 3, Anthoxanthum odoratum; 4, Cynosurus cristatus. The two last of little value as pasture Grasses.—Rape may be sown in July and mown during December for forage for cattle in the house.—*W C E.* For marshy grounds, occasionally overflowed by fresh water, Lawson recommends —Agrostis stolonifera, 2 lbs.; Festuca elatior, 3 lbs.; Festuca loliacea, 3 lbs.; Glyceria aquatica, 5 lbs.; Glyceria fluitans, 5 lbs.; Phalaris arundinacea, 2 lbs.; Phleum pratense, 2 lbs.; Poa trivialis, 3 lbs.; Lotus major, 2 lbs. This is in the case of alluvial soils. Where the soil is of a dry porous nature, on an open gravelly soil—and this corresponds more to the specimen you have sent—it is advised to sow: Achillea millefolium, ½ lb.; Agrostis vulgaris, 2 lbs.; Arrhenatherum avenaceum, 4 lbs.; Festuca rubra, 4 lbs.; Holcus mollis, 1 lb.; Lolium italicum, 4 lbs.; L. perenne, 6 lbs.; Medicago lupulina, 3 lbs.; Onobrychis sativa, 3 lbs.; Poa pratensis, 2 lbs.; Poterium Sanguisorba, 2 lbs.; Trifolium filiforme, 2 lbs.; T. repens, 2 lbs.; in all 35½ lbs., along with one bushel of Rye.

NETTLES: *Mr. Garrett* says that, advised by a correspondent of the *Agricultural Gazette*, he tried Nettles as food for pigs, boiling them in the same boiler in which he boils up their victuals usually. He gave them to the store pigs, who eat greedily every vegetable refuse offered them, but they will not touch the Nettles, nor even the liquor in which they are boiled.

RED-LEGGED GUERNSEY PARTRIDGE: Will some reader kindly state his experience of the time the eggs of this bird require in hatching? The books state the incubating period of the common partridge to be three weeks, leaving it to be inferred that all partridges agree in this respect; but I have good reason to believe that the eggs of the red-legged partridge require a longer time, and till the point can be settled by further experiment, should be thankful to know if others have noted the duration of the hatching process of these birds. *D.*

SCHOOL: *A Subscriber.* Mr. Dawes refers to the school at King's Somborne, Hants; where, we imagine, he may be addressed.

TANKS: *W M.* Your plan seems perfect. Pumps can be had with metal valves and metal pistons, with no leather about them at all. They are a good deal more expensive, but they are much more lasting, especially in the case of liquid manure.

TILE MACHINE: *A B C.* Mr. Whitehead, of Preston, Lancashire, has carried off the prize at the Society's shows in York and Norwich. He has machines varying from 17*l.* 10*s.* to 38*l.* in price. And we believe the grounds of the judgment in its favour to be trustworthy. 2*l.* 10*s.* per cent. on the rental is an ordinary charge for valuing estates. It includes all expenses; 5*l.* 5*s.* a day and expenses we should not consider a very high charge under these circumstances. Valuations merely for the information of the owner may be made by any one without a license, and there is no need that they should be drawn out on stamped paper. When the valuation is between two parties, and has the effect of a bond, of course the case is different. We do not know to what book to refer you about farm buildings. Mr. Donaldson is about to bring out a book, we believe, on rural architecture.

WEEDS, &c.: *B M.* The Plantain must be got rid of by spudding up the plants. Bone-dust sown broadcast immediately after the hay crop will improve the aftermath, and especially the crop of the next year; 8 bushels per acre of bone-dust, with two or three bushels which have been acted on by half their weight of sulphuric acid, would be a good dressing per acre. —If you are about erecting a stable, Stewart's "Stable Economy" would probably furnish you with useful hints.—*W D C.* Thistles and Sorrel must be pulled up; that is the true method of destroying them.

Markets.

COVENT GARDEN, JUNE 8.

Vegetables are abundantly supplied. Strawberries and Hothouse Grapes are both plentiful, and the same may be said of Pine-apples. Peaches and Nectarines are far from scarce. Walnuts and Chestnuts are abundant; Oranges and Lemons sufficient for the demand. Young Carrots and Turnips may be had at from 6d. to 1s. 6d. a bunch. The supply of green Peas is on the increase. Frame Potatoes fetch from 9d. to 1s. per pound. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, and Rhubarb are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Cinerarias, Lily of the Valley, Pinks, Carnations, Rhododendrons, Ranunculuses, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 10s	Lemons, per doz., 1s to 2s

Carrots, per bun., 9d to 1s	
Spinach p. sieve, 9d	

POTATOES.—SOUTHWARK, June 3.

The Committee report that the trade is heavy, considering the shortness of our supply, which is accounted for from the very warm weather during the last few days. The following are this day's quotations:—York Regents, 120s. to 160s. per ton; Scotch cups, 70s. to 80s.; ditto whites, 50s. to 60s.; Rhenish do., 60s. to 85s.; Belgian do., 60s. to 75s.

HAY.—Per Load of 36 Trusses.

SMITHFIELD, June 6.

Prime Meadow Hay	70s to 75s	Clover	68s to 84s
Inferior ditto... ...	55 65	New Clover	— —
Rowen	54 60	Straw	23 27
New Hay	— —		J. COOPER.

A very slow trade.

CUMBERLAND MARKET, June 6.

Prime Meadow Hay	70s to 74s	Inferior	65s to 75s
Inferior ditto... ...	55 65	New Clover	— —
New Hay	— —	Straw	24 28
Old Clover	78 84		JOSHUA BAKER.

WHITECHAPEL, June 6.

Inferior ditto ...	50 55	Inferior ditto... ...	65 70
New Hay	— —	Straw	22 26
Old Clover	80 84		

HOPS.—FRIDAY, June 7.

Messrs. PATTENDEN and SMITH report that the accounts from the plantations speak of a slight attack of fly generally, but it is not sufficient to cause any alarm. Middling and fine yearlings are in fair demand, as also fine 1846's and 1847's.

Mid. and East Kents ...	p. cwt. 160s to 200s	Farnhams, p. cwt.	—s — —s
Weald of Kents ...	130 —160	Yearling Kents ...	40 —100
Sussex	110 —130	Yearling Sussex...	40 —100
		Old Hops	20 — 70

SMITHFIELD, MONDAY, June 3.

The supply of Beasts far exceeds the demand. Trade is very dull, and 3s. 4d. is quite an extreme quotation. The number of Sheep and Lambs is rather larger; late prices are with difficulty supported. Calves are plentiful, but the average quality is not good, consequently choice ones make 4s. readily. From Holland and Germany there are 341 Beasts, 1040 Sheep, and 207 Calves; from Spain, 120 Beasts; from Scotland, 200; and 2000 from Norfolk and Suffolk.

Per st. of 8 lbs.—s d s d		Per st. of 8 lbs.—s d s d	
Best Scots, Herefords, &c.	3 2 to 3 4	Best Long-wools	to
Best Short-horns	3 0 — 3 2	Ditto Shorn	3 6 — 3 8
2d quality Beasts	2 6 — 2 10	Ewes & 2d quality	— —
Best Downs and Half-breds	—	Ditto Shorn	3 0 — 3 4
Ditto Shorn	3 8 — 3 10	Lambs	4 8 — 5 4
		Calves	3 0 — 4 0
		Pigs	2 8 — 3 8

Beasts, 3261; Sheep and Lambs, 26,720; Calves, 243; Pigs, 310.

FRIDAY, June 7.

The supply of Beasts has very considerably fallen off; they are readily sold at an advance of about 2d. per 8 lbs. We have an average number of Sheep and Lambs; for the former, trade is cheerful at rather higher prices, but for the latter it is not better. There is a very large supply of Calves; they are with difficulty disposed of at a considerable reduction. From Germany and Holland there are 30 Beasts, 590 Sheep, and 253 Calves; from Scotland, 50 Beasts; and 119 Milch Cows from the home counties.

Best Scots, Herefords, &c.	3 4 to 3 6	Best Long-wools	to
Best Short-horns	3 2 — 3 4	Ditto Shorn	3 6 — 3 8
2d quality Beasts	2 8 — 3 0	Ewes & 2d quality	— —
Best Downs and Half-breds	—	Ditto Shorn	3 0 — 3 4
Ditto Shorn	3 8 — 4 0	Lambs	4 8 — 5 4
		Calves	2 6 — 3 6
		Pigs	2 8 — 3 8

Beasts, 601; Sheep and Lambs, 13,030; Calves, 684; Pigs, 350.

COAL MARKET.—FRIDAY, June 7.

Buddle's West Hartley, 13s.; Carr's Hartley, 13s.; Wallsend Braddyll's Hetton, 15s. 6d.—Ships at market, 37.

MARK LANE.

MONDAY, JUNE 3.—The supply of English Wheat to this morning's market was small, and cleared at about the prices of this day se'nnight. Foreign met a very retail inquiry, but we do not alter our quotations.—Beans are 1s. per qr. cheaper. —Barley and Peas are unaltered in value.—The Oat trade is firm, and the finest qualities command rather more money.

Foreign	18097	3143	—	20535	576	1276

FRIDAY, JUNE 7.—With the exception of 10,250 qrs. of foreign Wheat, the arrivals of all grain during the week have been moderate. To-day's market was thinly attended, and the amount of business transacted very trifling; the value of Wheat, Barley, Beans, and Peas may be considered nominally the same as on Monday; but where it was imperative to force sales of Wheat from ship, the demand was so limited that they could only be effected at a decline of 1s. to 2s. per qr.—The Oat trade is firm, and fine qualities are the turn dearer.—Flour is a dull sale, and the turn of prices in favour of the buyer.—There has been some little business done in floating cargoes of Galatz Maize during the week at 31s., cost, freight, and insurance. Although the weather has been fine, and the value of Wheat has been generally well supported in the principal markets of the kingdom, and in two or three even symptoms of improvement have been manifest, with the exception of Beans, which are 1s. per qr. cheaper, prices of spring corn are maintained. The country continues to wear a promising appearance. Konigsberg, 1st inst.: High mixed and mixed Wheat in good demand, at 39s. to 37s.

LIVERPOOL, FRIDAY, JUNE 7.—There was a small number of buyers at our Corn Exchange to-day, and a general determination on the part of millers to remain inactive, and we have to note a dull sale for Wheat of all descriptions. Barley, Malt, Beans, and Peas meeting very little notice, scarcely maintained our last quotations. Oats, of which few good mealing samples remain undisposed of, were held firmly, but moved sparingly at late prices. In Oatmeal no variation. Indian Corn, upon a more limited demand than before, receded 6d. per qr. for parcels not yet landed.

TO NOBLEMEN, GENTLEMEN, AMATEURS, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed to sell by public Auction on the premises, Rosary, Breadmore, Hammersmith, on MONDAY, June 17th, 1850, at 12 o'clock, by order of the trustees of H. G. Hannington, Esq., three newly-erected Greenhouses, about 100 capital one, two, and three-light Boxes, Hand-lights, two Iron Rollers, Barrow, Seakale and other Pots, 100 Avenue Irons for climbers, 12 Hives of Bees, a large quantity of Chinese Figures, Vases, and Statues, 150 Fancy and other Rabbits, 100 Pigeons and Houses, 40 Doves; a fine assortment of fancy Poultry, Spanish and other breed; Store and Guinea Pigs; 13 large Zinc Store Canisters, three Garden Engines, 60 Mats; together with the selected Stock of Greenhouse Plants, 200 doz. of German Miniature Plants in pots, 15 gross of handsome German Pots, and sundry effects.—May be viewed two days prior to the Sale. Catalogues may be obtained (6*d.* each, returnable to purchasers, without which no person can be admitted) on the premises of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to sell by public Auction, on the premises, Sheep-lane, Cambridge-heath, Hackney, on MONDAY, June 10, at 1 o'clock, Three Newly-erected GREENHOUSES, each 120 feet long; about 1000 feet of Hot-water Pipe, Boilers, and Cisterns, Stages, a quantity of Slate, Shelving, &c.—May be viewed two days prior to the sale. Catalogues may be had on the premises, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on THURSDAY, June 13th, a first-rate Collection of DAHLIAS, also the newest varieties of Fuchsias, Verbenas, Geraniums, Heartsease, Roses, and other plants in bloom; together with a variety of Ornamental Plants for bedding.—May be viewed the Morning of Sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

EAST INDIAN ORCHIDS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent-garden, on MONDAY, June 10, at 12 for 1 o'clock precisely, 20 plants of Phalænopsis amabilis or grandiflora, just received from Manilla in fine health, and a small consignment from Ceylon, including some good Saccolabiums, Vandas, Dendrobiums, Cœlogynes, &c.—May be viewed the morning of sale, and Catalogues had.

MR. BATEMAN'S CELEBRATED COLLECTION OF ORCHIDS.—The Committee for providing a Church, Parsonage, and Schools in the wild, populous, and neglected district of Biddulph Moor, are happy to inform the growers of Orchidaceous Plants, that Mr. Bateman, in promotion of this important object, has generously placed at their disposal about 400 of his SPECIMEN PLANTS, among which will be found nearly all the rarest and most beautiful species at present in cultivation. These will be submitted for unreserved sale by Auction, by Mr. J. C. STEVENS, at his Great Room, 38, King-street, Covent-garden, on TUESDAY, the 11th day of June, at 12 for 1 o'clock, on the morning of which day they will be on view. — Catalogues may be had on application to the Auctioneer, or from either of the Secretaries, who will be happy to give any additional information respecting the projected Church, &c.

Rev. EDWARD WILSON, Buglawton, near Congleton,
Rev. JOHN SUTCLIFFE, Oatlands, ditto,
Honorary Secretaries.

FOR PUBLIC SALE, on MONDAY, June 10, at 2 o'clock precisely, at the New Corn Exchange Tavern, Mark-lane, 220 TONS OF ANIMAL MANURE OR GUANO, just imported per Queen of the Tyne, from Buenos Ayres. Catalogues and further particulars of J. A. RUCKER and BENCRAFT, Brokers, 26, Commercial Sale Rooms.

TO NURSERYMEN, GARDENERS, &c.

TO BE LET OR SOLD, the Lease of the well-known and long established PARADISE NURSERY, Hornsey-road, Islington. The whole or part of the Glass and Stock may be taken at a valuation.—Further particulars may be had by applying to Messrs. PROTHEROE and MORRIS, Leytonstone, Essex; or to Mr. WM. PAMPLIN, jun., on the premises.

MAYFIELD, SUSSEX.

TO BE LET, two desirable FARMS, adjoining each other, with convenient Houses and Farm Buildings in good repair, at Michaelmas next. They contain respectively about 270 acres of Arable, Hop, Meadow and Pasture Land, in the usual proportion. Rent 20*s.* per acre, tithe free. The Game is preserved, but the tenant will have permission to kill hares and rabbits. None need apply who cannot furnish most satisfactory testimonials as to their respectability and capital; and such parties will meet with every encouragement from the landlord, with reference to the present depressed state of agriculture.—Applications to be made to J. H. TRISTON, Esq., 5, Stone-buildings, Lincoln's-inn, London.

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

SUPERB NOVELTIES IN PAPIER MACHE, at MECHI'S, 4, Leadenhall-street, London.—A visit to this Establishment will prove that there is not in London another such stock of elegancies. They consist of Caddies, Tables, Envelope Cases, Netting Boxes, Companions, Cabinets, Jewel Cases, Work Boxes, Dressing Cases, Tea Caddies, Hand and Pole Screens, Card Racks, Table Inkstands, Regency Writing Desks, Portfolios, Playing Cards, and Visiting Card Cases, Cigar and Bottle Cases, Note and Cake Baskets. Also an assortment of Needle Cases, in pearl and tortoiseshell, Silver and Gold Pencil Cases, Pen Holders, and other articles suitable for presents. Inventor of the Patent Castellated Tooth Brush.

THE PRACTICAL GARDENER AND MODERN HORTICULTURIST; in one volume, 988 pages, closely printed, with upwards of 300 illustrated Woodcuts, containing the present improved scientific mode of managing the Kitchen, Fruit, and Flower Gardens, the Greenhouse, Hothouse, Conservatory, &c. By CHARLES M'INTOSH, C.M.C.H.S., of Dalkeith Palace. In cloth, lettered, price 21*s.*; and also with Specimens of choice Flowers, coloured, 26*s.*

"The labour and experience of a life devoted to the science of Horticulture."—*Vide Author's Preface.*

With an APPENDIX, describing a new and economical method of producing uniform Bottom-heat from Hot Water in Tanks, upon the most simple plan, with explanatory Diagrams, and Reference to Buildings now in successful operation; by which means, the "King of all Fruits," the Pine, and other tropical fruits and flowers, may be cultivated at less than half the expense of the old system.

London: THOMAS KELLY, Paternoster-row; SIMPKIN, MARSHALL and Co.; and sold by all booksellers.

On the 31st ult. was published, price 2*s.* 6*d.*, No. IV. of

PAXTON'S FLOWER GARDEN.

Edited by DR. LINDLEY and JOSEPH PAXTON,

And Illustrated by highly finished Plates and Woodcuts.

London: BRADBURY and EVANS, 11, Bouverie-street.

Lately published,

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics.

It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics, these little works will be found particularly suited. The principles of the various Sciences are rendered as familiar, and brought as near to our commonest ideas, as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

TAYLOR, WALTON, and MABERLY, Booksellers and Publishers to University College, 28, Upper Gower-street, and 27, Ivy-lane, Paternoster-row, London.

Just published, Second Edition, with Additions, 5*s.* 6*d.* cloth,

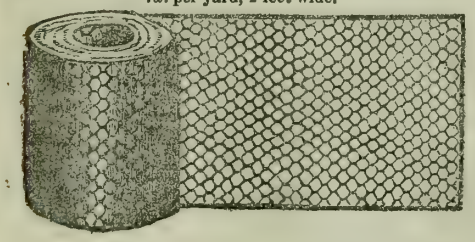
London: LONGMAN, BROWN, GREEN, and LONGMANS.

TO BUILDERS, &c.
IMPORTANT SANITARY INVENTION.



BY HER MAJESTY'S ROYAL LETTERS PATENT.
C. MARSDEN'S ROTARY WATER-CLOSETS and EFFLUVIA TRAPS, acknowledged by the most scientific to be the best and simplest self-acting Water-Closets and Effluvia Traps ever invented. A stench arises at the time of using all other Water-Closets—with this invention it can be got rid of. It is constructed in the shape of a drum, with four receivers or buckets caused to revolve by the weight of the matters falling into one of the receivers, when it instantly empties itself into the drain or sewer, and another bucket is ready from the opposite side to take its place, and two others on their ascent, to be emptied in their turn, while any upward escape of effluvia during these successive changes is effectually prevented, by overhanging and side flaps of vulcanised India-rubber, so placed that it is impossible to get choked up or get out of order; no balance weight or handles, no D or syphon traps required with these Closets. All traps that require water to keep them air-tight must necessarily leave a sediment to putrify. The value cannot be believed unless seen and tested.—Also Manufacturer of Decorative Marble Paper-hanging.—Waterloo House, Kingsland-road, near the Bridge.

CHEAP AND EFFECTIVE FENCE AGAINST HARES AND RABBITS.—Iron Wire Netting of various patterns, to exclude the smallest Rabbits, in coils of 50, 100, or any given number of yards, at prices varying from 4d. to 1s. per yard run. Aviary Net at proportionate prices. None sent out without at least two coats of the best Anti-corrosive Paint. Testimonials of the highest and most respectable character, received during the last 13 years, enable the Advertiser to speak with confidence as to the excellence of the article.—Apply to Mr. SAMUEL TAYLOR, Barnwood, near Gloucester; or to ROBERT WOODCOCK, at the Manufactory, Stoke Ferry, Norfolk.

GALVANISED WIRE GAME NETTING.—
7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7d. per yd.	5d. per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.
Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

METCALFE AND CO.'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.
METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.
CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. LLOYD, 12, Salisbury-square, London, and receive one copy as a sample.

One of these Mattresses, with a French Mattress on it, is a most excellent and soft bed. HEAL AND SON'S List of Bedding, with full particulars of Weight, Sizes, and Prices of every description of Bedding, sent free by post.
HEAL AND SON, Bedding Manufacturers, 196, opposite the Chapel, Tottenham-court-road, London.

DEPOT FOR PATENTED AND OTHER NEW AND USEFUL INVENTIONS, 97, NEWGATE-STREET.
ANTHONY'S PATENT AMERICAN CHURN.—"LONDON GOSSIP.—Then there is another bit of art,—which has been exhibiting itself in high quarters—A New American Churn, which makes butter almost as fast as cooks can use it. What will our dairy farmers say to this Yankee achievement? Will they take a hint, remembering that in these times butter travels by railway?"—*Chambers's Edinburgh Journal*, 18th May.
KEY's Patent American Force and Suction Pump, Ransome and Parson's Filters, Flexible Canvas Hose, lined with Gutta Percha, &c., to be had of KEY and MITCHELL.

ENORMOUS SAVING! GOING WITH THE TIMES!
HOW TO KEEP A HORSE for less than ONE SHILLING per DAY. The articles and numerous references may be seen, and a list of prices had at MARY WEDLAKE and Co.'s, 116, Fenchurch-street. A Pamphlet on the above may be had, each (post free) 1s. Also
HOW TO MOW, Cut, Cart, and Stack HAY, for less than HALF the usual cost, in any county and in any weather.—N.B. A Pamphlet on the above may be had, each (post free) 1s.

A BOON TO THE FARMERS.
FARMERS, be of good cheer, all is not yet lost.
Come to us, you will find us ready to meet the times!
As you cannot get the same price for your produce, so we cannot expect from you the same price for our IMPLEMENTS, and without first-class manufactured Implements you cannot stand these times! By inclosing two stamps, a list, with illustrations, will be forwarded. Real makers of what they sell.—Most liberal discount for cash.

PORT NATAL, NEW ZEALAND, AUSTRALIA.
Emigrants are informed MARY WEDLAKE and Co. have from time to time supplied the first settlers to Swan River and Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS, and tools of first-rate class. They beg an inspection of their stock.—N.B. Purchasers may have the benefit of an introduction. Most liberal discount for cash.

A LIVER COMPLAINT OF A MOST HOPELESS NATURE CURED BY HOLLOWAY'S PILLS.—Mr. Thomas Clark, of Lake George, New South Wales, was seriously afflicted for years with a liver complaint. His medical attendants, after trying all their skill, candidly gave their opinion that his case was hopeless. In this situation, and when expecting that every day would terminate his earthly career, a friend recommended him to try HOLLOWAY'S Pills, assuring him that he knew a person who was cured by them of that complaint. He adopted the advice and found speedy relief from taking them, and was in a short time perfectly restored to health.—Sold by all vendors of medicines, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Churchrow, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JUNE 8, 1850.

The Meeting then declared JOHN SHEPHERD and EDWARD BEACH, as having the greatest number of Votes, duly elected Pensioners of this Charity. EDWARD R. CUTLER, Sec.

37, Farringdon-street, June 15.

HALSTEAD AND NORTH ESSEX FLORAL AND HORTICULTURAL SOCIETY.—A GRAND FLORAL AND MUSICAL FETE will take place in the old Baronial Hall, at Hedingham Castle, near Halstead, Essex, on TUESDAY, the 9th of JULY, when the following Extra Prizes for SEEDLINGS (open to all England) will be given, namely, to be shown in pots, best Seedling Geranium, dark or crimson variety, 10*s.* 6*d.*; ditto, light variety, 10*s.* 6*d.*; ditto Fuchsia, dark variety, 10*s.* 6*d.*; ditto, light variety, 10*s.* 6*d.*; ditto Petunia, dark variety, 5*s.*; ditto, light variety, 5*s.*; ditto Calceolaria, 5*s.* CUT FLOWERS.—Best Seedling Verbena, 3 trusses, 7*s.* 6*d.*; ditto Pansy, 6 blooms, 7*s.* 6*d.*; ditto Pink, 6 blooms, 7*s.* 6*d.*; ditto English Iris, 6 blooms, 7*s.* 6*d.*; ditto Ranunculus, 6 blooms, 7*s.* 6*d.* G. P. ARDEN, Hon. Sec.

THE CHELTENHAM HORTICULTURAL SOCIETY will hold their 3d Annual Exhibition on Tuesday, June 18, at Pittville Spa. Gates opened at 2 o'clock. Admission, 2*s.* each. This Society holds five exhibitions in each year, and a Chrysanthemum Show in November. The days fixed for the other exhibitions are July 23d, Sept. 10th, and Nov. 12th.

By order of the Committee, C. F. WICKES, Secretary.

OXALIS ELEGANS FROM PERU.—A beautiful hardy species of Oxalis, in two distinct varieties; an abundant and constant bloomer, flowering in the open border from May till November—a desirable hardy plant for permanent beds.

Messrs. VEITCH and SON are now sending out flowering plants of the above at 5*s.* each, or six plants to the trade for 21*s.*, for either or both varieties together. Figured and described in Paxton's "Magazine of Gardening" for October, 1849, and Curtis's "Botanical Magazine" for January, 1850.

Exeter, June 15.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER, AND CELERY.

JOHN CATTELL, SEEDSMAN and NURSERYMAN, Westerham, Kent, begs respectfully to inform the public that Plants of his superior true sorts of the above are now ready, and will be forwarded, as usual, to order, on receipt of postage stamps or Post-office orders, at the undernamed prices, basket or mat and package included:

All the sorts of early Cabbage, Savoy, and Kale, including Brussels Sprouts, 4*s.* 6*d.* per 1000; all the sorts of Autumn and Spring Broccoli and Red and White Celery, 6*s.* per 1000; Cauliflower, early and late, and Red Cabbage, 9*d.* per 100; Drumhead or Cattle Cabbage, 3*s.* 6*d.* per 1000, 6*d.* per 1000 less when no mat or package is required. Packages of 1000 and upwards delivered free of carriage to the Edinbridge Station of the South-Eastern Railway.

Seeds of CATTELL'S superior "Dwarf Barnes," and his "Dwarf Reliance" Cabbage, may be had in packets, by post, for 12 penny stamps per packet, the former containing 1 oz., as usual, and the latter ½ oz.

ESCALLONIA MACRANTHA, beautiful, hardy evergreen, flowering Shrub from Patagonia.—The largest flowers, and handsomest of all the known species of Escallonia; the foliage a dark glossy green, habit compact and good, and an abundant bloomer, producing its clusters of beautiful rose-coloured flowers through summer and autumn.—Messrs. VEITCH and SON are now sending out fine established Plants of the above at 21*s.* each, or one over to the Trade on every three Plants taken. It is a Plant they can confidently recommend, and may now be seen in their Nursery covered with bloom. A coloured Plate and letter-press Description will be sent, postage free, on receipt of six postage stamps.—Exeter, June 15,

TO THE LADIES THAT TAKE AN INTEREST IN THEIR FLOWER GARDENS, AND WHO DOES NOT?

D. FERGUSON, with much pleasure states he can supply them with well-rooted plants, from cold frames, of first-rate Verbenas, Calceolarias, Geraniums, Heliotropes, Fuchsias, Anagallis, Cupheas, Ageratums, Pentstemons, &c., for bedding out, at 1*s.* 6*d.* per dozen, if 5 to 20 dozen are taken; 1*s.* 3*d.* if 20 to 50; above 50, 1*d.* each; and if 100, five dozen will be added: carriage free to London, Birmingham, Leamington, Peterborough, Banbury, Bedford, and all intermediate stations on the North-Western Railway. Lists marked for selection at the above prices, sent free on application: but those not already in possession of a collection, D. F. advises parties to state the colour and quantity they want, and leave the selection to him; and to those who have no convenience for wintering plants, they will find it advantageous to give their annual orders in July or August for the following Spring, as they, on taking five dozen and upwards, will have the choice, not only of those marked in the list, but any other bedding-out plant, if possible to procure, at equally low prices.

Letters directed Buckingham, in place of Aylesbury, reach D. F. one day sooner: where all post-office orders are requested to be made payable.

CACTI AND CAMELLIAS.—To be Sold, by order of the Executors of the late Mr. ROBERT STONE, Frognal, Hampstead, Middlesex, a Choice Collection of the above Plants, some of which are very curious specimens; also a very superior variegated American Aloe, to blow in eight years' time.—May be seen on application on the premises, Frognal, Hampstead.

CALCEOLARIA GRANDIS, a shrubby Peruvian species, an abundant bloomer, habit neat and dwarf, foliage small, fine glossy green, flowers bright yellow.

Messrs. VEITCH and SON are now sending out good established plants of the above at 5*s.*, or six to the trade for 21*s.*

Exeter, June 15

TO GENTLEMEN AND FLORISTS.

TO BE DISPOSED OF, about 50 CAMELLIAS, fine healthy plants, in good variety, 25 of them standing from 5 to 7 feet high, and 4 feet across. The price for the whole, 25*l.* The plants may be seen on application to F. J. BUCK, Manor Nursery, Shacklewell-lane, near Kingsland, London.

TO LADIES AND OTHERS INTERESTED IN HORTICULTURE.

THE STRAWBERRY.—An eminent Medical Writer thus notices the properties of the Strawberry:—"The act of eating this fruit cleauses the teeth and gums, and purifies the breath: it assists digestion, fortifies the stomach, and being entirely soluble never turns sour or undergoes fermentation. In many cases it is positively medicinal, removing rheumatic affections and other diseases arising from obstruction of the system."

How essential therefore it is to cultivate such fruit in perfection! Those who are desirous of so doing should apply to Mr. JOHN ROBERTS, of 34, Eastcheap, London, who has recently published a pamphlet on the cultivation of this delicious fruit, together with many other fruits and vegetables, which may be obtained by enclosing three postage stamps, addressed to him as above.

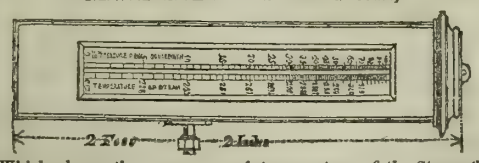
BEE HIVES.

GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—127, High Holborn, London.

Agents: WM. DRURY, Castle-street, Liverpool; HALL and WILSON, 50, King-street, Manchester; AUSTIN and M'ASLIN, 168, Trongate, Glasgow.

NOVELTY, ELEGANCE, AND DURABILITY.

R. RESTELL'S PATENT METALIC ORNAMENTAL GARDEN and CONSERVATORY LABELS, in a variety of patterns; may be written upon freely, are flexible, and calculated to last for 20 years.



To be had of the principal Seedsmen and dealers in Horticultural Implements.

Manufactory, 35, High-street, Croydon, Surrey.

TO BE DISPOSED OF, the Wholesale Department of an Old and Highly-respectable London Seed Establishment; any one wishing to embark in the trade, or to add to their own business, will find this an opportunity rarely to be met with.—Apply to Messrs. STUBMY and SIMPSON, 8, Wellington-street, London-bridge.

STEAM BOILER EXPLOSIONS.

HENRY BAKER begs to call the attention of Engineers and Proprietors of Steam Engines to his NEWLY-INVENTED STEAM-GUAGE,

Which shows the pressure and temperature of the Steam (it slightly differs from the drawing annexed). This instrument is an ornament to the Engine-room, and supersedes the ordinary Steam-guages in these respects. It is less cumbersome, cheaper, cannot get out of order in carriage, and is warranted accurate. Boiler explosions, in many instances, occur through Steam-guages not being in good working order, therefore every attention should be paid to these very necessary adjuncts.

HENRY BAKER'S STEAM-GUAGES may be fixed in a Counting-house, and will show the pressure the same as if it were fixed in the Engine-room, thereby having a check upon the man working the Engine. Price 2*l.* 5*s.*, and 2*l.* 2*s.*; Vacuum-guages, 3*l.* 3*s.* each.

HENRY BAKER, Barometer, Thermometer, and Philosophical Instrument Maker to the Board of Admiralty, 90, Hatton-garden, London.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long, 13 feet wide, 90*l*; 21 feet long, 13 feet wide, 50*l*.; 12½ feet long, 10 feet wide, 30*l*. A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber boxes, Iron hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

BLENHEIM PALACE KITCHEN GARDENS.

TO BE DISPOSED OF, the whole of the growing and now ripening crop of TWO PEACH HOUSES, TWO NECTARINE HOUSES, TWO VINERIES (finest Black Hamburgh and White Muscat), and an unequalled collection of the most splendid PINES, many of which will weigh 10 lbs. and upwards. This unrivalled assortment of Fruit offers an unusual opportunity to Tavern-keepers, Contractors for Balls, Public Breakfasts, or Dinners, to supply themselves for the next six or seven weeks with the finest fruit in the kingdom, at prices considerably lower than the exorbitant demands of the London Market Gardeners.—Applications from parties, to purchase the whole or part of the above, may be made to Mr. TURNBULL, Gardener, Blenheim, who will show the same.

TO GARDENERS AND OTHERS.

TO BE SOLD, A BARGAIN, A Six-roomed House, and a quarter of an acre of land, with two Greenhouses, &c., in a flourishing Building Society, which has been established more than six years, about five miles from Covent Garden Market.—For particulars, apply to Mr. STEPTOE, Herbalist, Covent Garden Market; and of Mrs. M'ALLISTER, Middle-row, Kensal New Town, Middlesex

TO FLORISTS AND OTHERS.

TO BE SOLD, very cheap, the LEASE of a Nursery, within two miles of London, containing one acre of ground, together with two good Dwelling-houses, let to respectable tenants, which nearly covers the rent of the whole. The Lease can be taken with or without the Stock (wholly pot plants) and Glass, or with a part thereof, to suit the convenience of the purchaser. For particulars, apply, if by letter post-paid, to A.B., 14, Sommerford-grove, Stoke Newington-road, near London.

TRUE DRUMHEADS FOR CATTLE, at THOS. WELLAND'S, Surrey Gardens, Wheeler-street, Godalming, Surrey, packed and delivered at Godalming Station, 3*s.* 6*d.* per 1000; other garden plants in great variety.

RANUNCULUSES, new and first-rate.—WALTERS'S Mixtures, which he offered in January last at 21*s.* per 100, may be seen during the week at Messrs. HURST & M'MULLEN'S, 6, Leadenhall-street, London, and orders taken for the same.

TO NURSERYMEN, GARDENERS, AND OTHERS.

PARTNERSHIP.—A young Man, aged 34, who has about 3½ acres of Land on a long Lease (more Land may be obtained, if required, adjoining the same), most desirably situated for a Nursery, in one of the greatest thoroughfares in a fashionable flourishing town, with a population of 8000, where there is but one more in the like business for many miles round. The Land is in a good state of cultivation, being at the present time well cropped with all kinds of Vegetables. There is also an increasing Seed Business. The Advertiser is desirous of meeting with a PARTNER, for the purpose of carrying out the business on a more extensive scale. Such an opportunity rarely offers itself.—For further particulars, apply by letter, prepaid, to H. P., care of Mr. George Warder Jordan, 11, Bell-yard, near Temple-bar, London.

HARTLEY'S PATENT ROUGH PLATE GLASS.

JAMES PHILLIPS AND CO., 116, Bishopsgate-street Without, beg to hand their list of Prices of the above description of GLASS.

		Cut to order in panes of	
8 by 6	and under	10 by 8	at 4½*d.* per foot.
10 by 8	,,	14 by 10	at 5*d.* ,,
14 by 10	,,	1½ foot, or sizes not exceeding 20 inches long	at 5½*d.* ,,
1½ foot	,,	3 feet, or sizes not exceeding 30 inches long ...	at 6*d.* ,,

PACKED IN BOXES of 50 feet each.

6 by 4 and 6½ by 4½...10*s.* 6*d.* 8 by 6 and 8½ by 6½...13*s.* 6*d.*
7 by 5 and 7½ by 5½...12*s.* 0*d.* 9 by 7 and 10 by 8 ...15*s.* 0*d.*

We do not pledge ourselves to execute large orders for small squares at the above prices, but only as far as they turn up in cutting. Should any quantity of small squares be required, a special contract is necessary.

Milk Pans from 2*s.* to 6*s.* each, Metal Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Wasp Traps, 3*s.* 6*d.* per dozen; Pastry Slabs, Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7*s.* 6*d*; 6 tubes, 10*s.* Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

From the *Gardeners' Chronicle*, December 8, 1849.—"As to the article substituted for Rough Plate, and which is actually in the market for the purpose of imposing upon gardeners, it is wholly unfit for any horticultural purpose. The best samples of it which we have yet seen is sold by Mr. JAMES PHILLIPS, 116, BISHOPSGATE STREET, LONDON."

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITION AT THE GARDEN, JUNE 8, 1850.

TO NURSERYMEN, SEEDSMEN, AND FLORISTS.

BETHAM AND BLACKITH (late JOHN BETHAM), CUSTOM HOUSE and GENERAL FORWARDING AGENTS, Cox and Hammond's Quays, Lower Thames-street, London, respectfully solicit the above to use their medium for the transmission of Plants, BULBS, &c., to or from all parts of the world. Constant communication maintained with the Continental and Foreign Nurseries.

Cox and Hammond's Quays, Lower Thames-street, June 15.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2d. per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½d. per foot. British Plate Glass, from 1s. 2d. to 2s. per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4d. per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2s. to 5s. each. Cucumber Tubes, from 12 to 24 inches long, at 1d. per inch. Lactometers, 7s. 6d. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

CROWN, SHEET, AND ROUGH PLATE GLASS FOR HOTHOUSES, CONSERVATORIES, &c.

The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.

100 and 200 feet cases of large Sheet Glass, from 2½d. per foot. Small ditto, 10s. 6d. per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Floriste, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

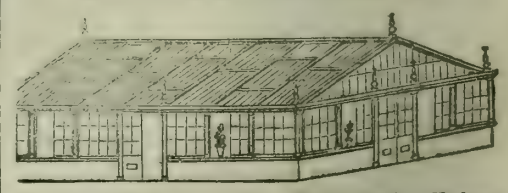
Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.



DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

Averuncators	Garden Scrapers	Pick Axes
Axes	Grape Gatherers and Scissors	Potato Forks
Bagging Hooks	Gravel Rakes and Sieves	Pruning Bills
Bills	Greenhouse Doors and Frames	,, Knives, various
Borders, various patterns	Hammers	,, Saws
Botanical Boxes	Hand-glass Frames	,, Scissors
Cases of Pruning Instruments	Hay Knives	,, Shears (riety.
Chaff Engines	Hoes of every pattern	Rakes in great va-
Chaff Knives	Horticultural Hammers and Hatchets	Reaping Hooks
Daisy Rakes	Hotbed Handles	Scythes
Dibbles	Ladies' Set of Tools	Scythe Stones
Dock Spuds	Labels, various patterns, in zinc, porcelain, &c.	Shears, various
Draining Tools	Lines and Reels	Sickles
Edging Irons and Shears	Marking Ink	Sickle Saws

		Youths' Set of Tools

G. and J. DEANE are Sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.—DEANE'S Horticultural Tool Warehouse, opening to the Monument, 46, King William-st., London-bridge

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—Under the patronage of her Most Gracious Majesty the QUEEN.—The THIRD EXHIBITION of the season will be held at the Royal Surrey Zoological Gardens, on WEDNESDAY, the 19th JUNE (open to all exhibitors), when Prizes will be awarded for the following productions, viz., Miscellaneous, Orchids, and Specimen Plants, Pelargoniums, Cape Heaths, Roses, Pinks, Ranunculus, and Fruit. In addition to the Prizes offered by the Society, Messrs. Paul and Son, of Cheshunt, offer Two Prizes for 12 New Roses, to Amateurs, and 17. 10s. will be awarded for Seedling Pelargoniums (see Pelargonium Fund advertisement in this Paper). The following Exhibitions will also take place at the Royal Surrey Zoological Gardens, on Tuesday, July 23d, and Wednesday, September 4th. List of Prizes, and the Rules for Exhibitors, may be obtained from JOHN TAYLOR NEVILLE, Secretary.
Ebenezer House, Peckham, Surrey.

THE FUNEBRAL CYPRESS—CUPRESSUS FUNEBRIS.
MESSRS. STANDISH AND NOBLE, of the Bagshot Nursery, beg to announce that they are now sending out the above magnificent Weeping Evergreen Tree, the hardiness of which is now proved beyond all doubt; and for particulars proudly refer their patrons to the highest authorities, viz., Dr. Lindley and Sir W. Hooker—see *Gardeners' Chronicle*, April 21, 1849, and April 13, 1850; Curtis's Botanical Magazine, for May; and the Gardeners' Journal, March 9 and 16 for the present year. Strong healthy plants, fit for immediate planting, 21s. each.—Bagshot Nursery, Surrey.

EXHIBITION OF AMERICAN PLANTS, KNAP HILL, WOKING, SURREY.
HOSEA WATERER begs to announce that the AMERICAN PLANTS at Knap Hill Nursery are now in bloom, and will continue in perfection during the month of June. As a display of flowers this is perhaps without a rival in this kingdom. May be seen, gratis, any day, except Sunday. The Knap Hill Nursery is within an hour's ride of London, being near the Woking station, South Western Railway, where every train stops, and from whence conveyances may at all times be had. H. WATERER is a principal contributor to the Exhibition in the Botanic Gardens, Regent's Park, orders for seeing which may be obtained on application to Fellows.
Knap Hill Nursery, Woking, Surrey, June 15.

AMERICAN NURSERY, BAGSHOT, SURREY.
GEORGE BAKER begs to inform the Nobility and Public his extensive collection of AMERICAN PLANTS are now in bloom, and will continue till the end of this month, and may be seen gratis. The Nursery is about 6 miles from the Staines Station, on the South Western Railway, and 3 from Virginia Water, from whence conveyances may be obtained.
G. BAKER is a contributor to the Exhibition in the Botanic Gardens, Regent's Park.—June 15.

MIMULUS INSIGNIS.
HENRY MAJOR, Knosthorpe, near Leeds, has ready for sending out healthy plants of the above most beautiful MIMULUS, price 3s. 6d. each, or three plants for 7s. 6d., post free.
This Mimulus has been very kindly presented to H. M. by the raiser, A. Clapham, Esq., who raised Mimulus "rubinus," and others. The following is the opinion of the Editor of the Gardeners and Farmers' Journal upon it:—"M. H. Your seedling is very attractive. Form excellent; throat bright straw colour deepening to chrome; lip brilliant crimson; edge perfect; throat spotted with rich crimson; the consistency of the flower most desirable."
It is respectfully requested that all orders be accompanied by a Post-office order or postage stamps.

MAYLE'S MODEL FUCHSIAS FOR 1850.—No grower can expect to win a prize at any of the principal exhibitions in town or country without these magnificent reflexed varieties.
Messrs. MAYLE and Co. will send out their SEVEN NEW FUCHSIAS on the 20th June, extra strong plants. From the very high opinions expressed of their merits by Dr. Lindley, Mr. Glenny, &c., they require no further comment from us. They are the things of the season, and must be had by all who wish to keep pace with the times.
No. 4, DIADEM, was shown at Walsall, near Birmingham, with two blooms, May 8th, and was awarded an extra prize. Judges' opinion: "By far the best ever raised."
Also first prize at Wolverhampton, May 25, against some fine older specimen varieties; and first-class certificate awarded at the Birmingham and Midland Society on the 20th.
Those in bloom were exhibited at Chiswick and Regent's-park June shows. The earliest orders will secure the strongest plants. Circulars can be had. Also Mr. Hoyles' superb Geraniums, a few extra strong blooming plants being left.
Stove, Greenhouse, Bedding Plants, &c., including every novelty of the season.—105, New-street, Birmingham.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE sent prepaid for four penny stamps, for postage. This Catalogue contains a rich assortment of the newest and best plants which can be procured. The stock of BEDDING PLANTS is unusually strong and fine. Several thousand plants of Verbenas are now ready for sending out, as well as our collection of other plants for bedding, the stock of which is also very extensive, consisting of Geraniums, Fuchsias, Petunias, Dahlias, Chrysanthemums, Anagallis, Bouvardias, Cupheas, Heliotropes, Plumbagos, Lantanas, Salvias, Lobelia Erinus grandiflora and compacta alba, Zauschneria californica, &c.
Persons requiring Plants for beds may depend on receiving a supply, strong, and in fine condition, at low prices.
Seed and Horticultural Establishment, Sudbury, Suffolk.

MEADOW AND PASTURE GRASS SEEDS.
GEORGE GIBBS AND Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32s. per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1s. 3d. per lb.; fine sorts for forming Lawns, 1s. 4d. per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the Kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes, kept ready for use, packed, and sent to all parts of the Kingdom; warranted best material. Garden-lights of every description, at JAMES WATTS', Hothouse Builder, Claremont-place, Old Kent-road. Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

EDWARD BECK, SLATE WORKS, ISLEWORTH.
SLATE CISTERNS, &c.; COLE'S PATENT.
E. BECK informs Horticulturists and the Public generally that Mr. COLE has granted him the use of his Patent for the unexpired term, and he is now able to supply SLATE CISTERNS fastened without iron bolts or the usual oil cement, thereby doing away with the difficulty which has hitherto existed of forwarding such articles by rail or waggon, fixed and ready for use instead of in pieces, as heretofore.
E. B. will be happy to answer any inquiries as to the price of Cisterns, or any other Slate articles manufactured by him, such as Orange Tubs, Plant Boxes, Tanks, Shelves, Garden-path Edging, Hot-water Tank Covers, Flower Boxes for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c., all of which may be seen in use at Worton Cottage, Isleworth, on application to the Gardener, Sundays excepted.
Estimates given for Work as shown upon Drawings, and in specifications. A large stock of Slate Slabs of all sizes and thicknesses, kept on sale.
N.B.—Dairies fitted either with Shelves or Milk Pans, of very neat appearance.

COUNTRY SHOWS.—Monday, June 17: Guildford Horticultural.—Tuesday, June 18: Hampshire Horticultural.—Wednesday, June 19: Stamford-hill Horticultural.—Thursday, June 20: Cheltenham Horticultural and Floral, Chichester Horticultural, and Bath Horticultural.—Friday, June 21: Newbury Horticultural.—Saturday, June 22: Staines Horticultural.

THE gem of the CHISWICK EXHIBITION on Saturday last was the purple Camarote (*Camarotis purpurea*) produced by Mr. HOLFORD's gardener, BASSETT. In this instance a poor and undervalued plant was shown to possess a degree of beauty which is hardly surpassed by any of its order: for what it wanted in breadth of colour it made up in gracefulness of form. To show that it could become a living pyramid of green and purple, most beautifully blended, was a great gardening achievement, and has for ever rescued a charming species from undeserved neglect.

The crown of the Exhibition, set with many gems, was a collection of Orchids from Mr. RUCKER's garden. Although it contained nothing so fine as the Camarote, yet it was studded with brilliants of the first water. No one ever before saw such glowing colours on these matchless jewels. The lemon-scented Toothtongue (*Odontoglossum citrosmum*) had exchanged its pallid hue for a ruddy glow that would have done no injustice to a Rose; the lip of the intermediate Cattleya rivalled the tint of JUNG BAHAUDER's amethysts; and no sapphire that glitters on his turban was more rich than the stain in the centre of Beauty Dendrobe's lip. How these things are to be done it boots not here to tell; it is clear that other growers still want the crowning art of throwing into their specimens such colour as gleamed from beneath the skin of Mr. RUCKER's favourites.

But unusual colour was not on this occasion confined to flowers only. The Marquess of WATERFORD's Irish Peaches were as perfect in their way as the London Orchids. No summer sun ever could have given a deeper colour, or elicited a richer perfume. To the very stalk they were ripened thoroughly. Much honour to our old acquaintance ROBERTSON, the Scotch gardener at Curraghmore; we only wish he had been an Irishman.

The next best specimens of good gardening were, to our mind, Mrs. LAWRENCE's Calceolarias. The florists, indeed, thought little of their "points," but everybody thought much of their cultivation. Short, stout, fat, healthy plants, with none of your spindling fly-bitten branches, and shrivelled leaves perishing under the influence of sulphur and red spider, but as healthy, and full of juice and life as a market gardener's Lettuce. If people could but turn out Calceolarias like these, they would soon recover their rank in public esteem. Thus grown they are charming; as they are usually grown they are hideous.

Of novelty there was little. The Roupellia, which gained the first prize, is a twining plant, with the habit and blossoms of a Stephanote, only the flowers want washing, and are not improved by 10 long brown tusks sticking out of the mouth. Messrs. VEITCH's Dipladenia nobilis was very much finer, but wanted the degree of novelty demanded of plants here exhibited as NEW.

Mr. COGAN, of the glass warehouse, in Leicester-square, placed upon the tables a glass Fern-temple, concerning which we shall only say for the present that it represented an excellent idea, which cannot fail to be worked out advantageously hereafter.

The day was fine; the garden delicious; and the number of visitors 7452, exclusive of 267 exhibitors and attendants.

THE beautiful appearance of the Rhododendrons and other AMERICAN PLANTS everywhere this spring, notwithstanding the severity of the winter—and the great improvements which the shows near London prove to have been effected among them, beyond anything that could have been anticipated—induce us to place at once, and prominently, before our readers some judicious observations on their cultivation, which have been recently published by Messrs. STANDISH and NOBLE, of Bagshot, in their new Catalogue of Hardy Ornamental Plants.

After remarking upon the general want of an accurate knowledge of the true principles of managing American plants, they proceed to remark to the following effect:*

"Comparatively few persons have succeeded in the cultivation of Rhododendrons; and those few, more from accidental circumstances than from a real knowledge of their natural requirements. In fact, it is a prevailing idea, that few localities are to be found where they will creditably exist—to luxuriate is out of the question. But, on the contrary, extensive practice shows that with a small expenditure of well-directed labour, Rhododendrons may be induced to repay the attention of the cultivator in any part, and almost any locality in Great Britain.

"A more unpromising appearance than that originally belonging to the present American Nursery at Bagshot, can scarcely be imagined. In its present improved state, it affords a good example of what can be done in the most sterile spots. The ground in question forms part of 50 acres, the whole of which is rated in the poor's-rate book at 8*l.* The soil, which is from 12 to 15 inches in depth, is a black sandy peat, resting upon a clayey subsoil very deficient in vegetable matter, and naturally incapable of producing any crop. With cultivation it has been rendered in the highest degree productive. The first operation was to drain it from 3½ to 4 feet deep; it was then trenched 2 feet deep, and to every acre so treated, from 30 to 40 tons of good farm-yard manure was added; and as a precautionary measure, in order to exhaust the rankness attendant upon this treatment, it was deemed necessary to take off the land a root crop of Potatoes, Carrots, Turnips, and Mangold Wurzel. After this treatment, American plants were found to thrive amazingly; but, like all crops in very poor soils, they continue to be benefited by the application from time to time of suitable enriching materials.

"It must not, however, be understood that American plants will flourish in a very poor soil; on the contrary, there is evidence everywhere that nearly all plants delight in a rich one. Even Mosses, Lichens, and Heath, are more healthy and vigorous in the richest localities. With a trifling expense, however, the poorest soil may be rendered suitable for Rhododendrons. An excellent compost may be made as follows:—To two parts of sandy loam or peat, or in fact any sandy soil that does not contain much calcareous matter (American plants exhibit a great dislike to that), add one-fourth leaf-mould, one-eighth sand, and one-eighth rotten manure. If wanted immediately, the whole should be well beaten, and thoroughly incorporated before using. It would, however, be of great advantage to allow the mixture to remain 12 months, turning it well two or three times during that period. In old exhausted beds, a good dressing of rotten manure forked in will be found highly beneficial.

"Another point of the highest importance, for it is the foundation of all success in the cultivation of the Rhododendron and fine-rooted plants of a similar character, is *never to allow them to become thoroughly dry at the root.* If this occurs, the whole structure of the plant is affected, deficiency of vital energy is the result, and the natural consequence of a deteriorated constitution is disease, and possibly death. The Rhododendron and its allies suffer more from excessive dryness than any plants which we recollect; therefore a damp situation must be provided for their site. If, however, stagnant water is present, drains must be employed, and they should be 3 feet in depth. If the plants can enjoy the shade of trees without drip from them, so much the better.

"At Highclere, the seat of the Earl of CARNARVON, in the lake at Milford, are several small islands of from 10 to 20 yards in diameter, planted with American plants, presenting the highest state of luxuriance; many of the plants are from 10 to 15 feet high, and constitute, in the blooming season, masses of beauty, from their summits to the very surface of the lake. The soil of these islands is not more than 18 inches above the water.

"On the Himalaya Mountains, the Rhododendron is invariably found growing near or on the margin of morasses. So magnificent is the appearance of masses in flower of the scarlet species of these mountains, that Dr. WALLICH compares the effect to that of regiments of soldiers in scarlet uniforms in the full sun when viewed at a distance. In America and other parts of the world, where any of the very

* We place this matter between inverted commas although it is not a literal transcript, because it is essentially the statement of Messrs. STANDISH and Co.

extensive tribe, commonly known as 'American Plants' are found, it is always on the margin of lakes, rivers or bogs, or on the nearest portions of dry land in their vicinity. Surely, then, if the many boggy places and swamps which are to be found in the plantations, on the borders of 'drives,' and even in view from many of our noblemen's princely mansions, are not worth reclaiming for any other purpose, they afford excellent situations for the display of taste and liberality: the ultimate result of which must be to gratify the eye of the proprietor, to enrich the landscape, and to give to our woodland scenery a beauty which is now, except in a few isolated cases, confined to the shrubbery and the pleasure ground.

"If only a moderate amount of stagnant moisture is present, ordinary draining is all that will be requisite. But there are situations in which this is not available, or would be too expensive, as, for instance, where the bog is of such a depth as would require a large amount of labour to procure sufficient 'fall' for the drains. Under such conditions the desired end can be arrived at by the following means: Procure a quantity of brushwood, faggots, poles, old 'pollards,' or any materials of a like nature, and with them form a foundation on the spot you wish to plant; upon this sufficient soil must be placed, that, allowing for subsidence, not less than 18 inches of suitable compost will remain above the surface of the bog. In such localities the Rhododendron will flourish in all its native beauty, and as the growth will be rapid, the whole substance of the soil will quickly become matted together by the roots of the plants, completely preventing any subsidence in the soil after the wooden foundation is decayed."

Suppose, however, that soil is naturally dry, and therefore the reverse of what "American" plants require, then Messrs. STANDISH and NOBLE give the following directions for nevertheless securing an adequate amount of moisture.

"The means by which this can be attained are—1, deep trenching the natural soil; and 2, keeping the beds perfectly flat, and *below* the surrounding surface, in order to prevent the escape of moisture, otherwise than by evaporation. In such situations, it is absolutely necessary to trench or in some way prepare a soil, 3 or 4 feet in depth; and the following will be found an excellent method. Having determined the outline of the beds, remove the soil a good spade's depth, with all its attached vegetation, to some convenient spot immediately contiguous to the operations; then cart away from 18 inches to 2 feet of the remaining soil, well breaking up the bottom; trenching it 18 inches would be better still. Upon this cast in the surface soil previously removed, well chopping it with the spade as the work proceeds; filling up with a sufficient quantity of prepared soil, so that after settling down it shall be a few inches below the natural surface. During dry weather, after the beds are planted, the surface should be kept constantly stirred with the hoe and rake, for the double purpose of preventing the growth of weeds, and retarding evaporation. Should an excessively dry season occur, the whole surface of newly-planted beds may with advantage be wholly covered with the short Grass from the lawns. It will at least prevent the necessity of a frequent use of the watering-pot, the application of which in all out-door gardening is a practice 'more honoured in the breach than in the observance.' If the beds are situated in the neighbourhood of trees, they are sure to be invaded by a legion of roots which, if allowed unmolested possession, will in a few seasons appropriate the whole of what you had intended for your favourites. But as we recommend American plants, in such situations, to be replanted and the soil trenched to a depth of 2 feet every autumn, and every third or fourth year the whole mass of soil trenched to the bottom—there will not be much to fear upon that point, and the mass of soil, by being constantly rendered permeable to the autumn rains, will always contain a large amount of moisture. There need be no fear of the plants suffering from removal, as Rhododendrons can be transplanted with perfect safety, even after they have attained an immense size, more especially when they have constantly been subjected to such treatment."

In conclusion the writers point out the error of supposing that these directions will involve a large outlay. "Nothing can be more erroneous. The directions apply to the poorest soils, and to situations of the worst character. In trenching and cultivation a small pecuniary outlay will accomplish much. Labour in this respect is cheap, and employment much needed. The sweepings of lawns, consisting of leaves and Grass, the trimmings of walks, and the refuse and clearings of the flower-beds, will, when thoroughly decayed, furnish a compost in every way available for the purpose, where the natural soil is not what could be desired; and here the preparation of the beds constitutes a mere nominal outlay."

We shall take some opportunity of commenting upon these good practical remarks, which, in the meanwhile, we recommend as safe rules to be observed by those who wish to emulate the Rhododendron growers of Bagshot and its neighbourhood.

NOTES OF A TRAVELLER.—No. XII.

PLANTS AND GARDENS OF THE ENGLISH AT SHANGHAE IN CHINA.—The gardens of the English residents in Shanghae far excel those of the Chinese in the number of species of trees and shrubs they contain, and also in the neat and tasteful manner in which they are laid out and arranged. In 1845 only one or two small English houses had been built, and no gardens had been formed; but now a large English town has risen on the banks of the river, and almost every house is surrounded by a garden.

The late Mr. Hetherington was the first to attempt rearing vegetables on a large scale. He introduced Asparagus, which now succeeds admirably at Shanghae, Rhubarb, Seakale, and all the vegetables common in English gardens. He also raised the Strawberry from some seeds I sent him in 1846; but, curious enough, although it grows luxuriantly, it scarcely bears any fruit. The blossoms appear to go blind soon after they expand. I have no doubt, however, that some method will be devised to overcome this habit, and I expect to see Strawberries produced in great abundance and in perfection in Shanghae. The ground about the town is too low and wet for the growth of the Potato, and hence no one has succeeded in rearing what would be called a good crop of this desirable vegetable. In the course of time, however, when the cultivation is attempted in the higher parts of the country, we may expect to get better Potatoes here than at Macao, although the latter are usually most excellent.* Mr. Hetherington fell a victim to a fever of a very fatal kind, which prevailed in the autumn of 1848. He was a true specimen of the old English gentleman, and was deeply regretted by all who had the pleasure of knowing him.

The English Consul, Mr. Alcock, has also a good vegetable garden on the grounds attached to the consulate. There is a noble plant of the Glycine sinensis in this garden, which flowers most profusely, and becomes covered with its long legumes or pea-like fruit, which it ripens to perfection.

The two first ornamental gardens are those of Mr. Beale and the Messrs. Mackenzie. Mr. Beale's house—a fine square building of two stories—is placed in the centre of the garden. In front is a fine Grass lawn, which extends from the house to the boundary wall near the river. Behind the house there is another lawn surrounded with a dwarf ornamental wall. A wide gravel walk leading from the entrance to the back part of the garden divides the house from the business part of the premises. This garden is rich in plants indigenous to China, and also contains many which have been introduced from other parts of the world. On entering the gate the first thing which strikes a botanist is a fine specimen of the new Funebral Cypress nearly 6 feet high, and just beginning to show its beautiful weeping habit. This has been obtained from the interior, and does not grow in the neighbourhood of Shanghae. Mr. Beale intends to plant another specimen on the opposite side of the gate, and when the two grow up, a very striking and pretty effect will be produced. In the same border there are fine specimens of Weigela rosea, Forsythia viridissima, Chimonanthus, Moutans, Lagerstrœmias, Roses, &c., and nearly all the new plants sent home to the Horticultural Society from 1843 to 1846. In this part of the garden there is also a nice plant of the new Berberis japonica, lately obtained from the interior, and described in my last letter.

The American Magnolia grandiflora has been introduced here, and promises to be a very ornamental tree; its fine green leaves and noble flowers are much admired by the northern Chinese. Several plants of Cryptomeria japonica are succeeding admirably, and will soon be much more beautiful than any the Chinese have in this part of the country. The garden has been raised with a large quantity of fresh soil considerably above the level of the surrounding ground, so that all the family of the Pines succeeds much better than in those places where they are usually planted by the Chinese; besides the latter generally spoil all their trees belonging to this family by lopping off the lower branches for firewood.

Large quantities of the Olea fragrans—the Qui Wha of the Chinese—are planted in different parts of the garden. These succeed much better here than in the south of China. In the autumn, when they are in bloom, the air is perfumed with the most delicious fragrance. Another most fragrant plant is the new Gardenia (G. Fortuniana), now common in English gardens, to which it was introduced by the Horticultural Society in 1845. In Mr. Beale's garden many of the bushes of this charming species are 10 or 12 feet in circumference, and in the season are covered with large double white flowers, as large as a white Camellia, and highly fragrant. Altogether this is a most interesting garden, and promises to be to Shanghae what the well-known one of Mr. Beale's father was to Macao.

* I have made a great many inquiries about the Potato disease in China, but it does not seem to have made its appearance. The Macao Potatoes have always been good and sound. *R. F.*

The Messrs. Mackenzie's garden here is also well worthy of notice. It resembles some of the neat suburban residences near London. The shrubs are arranged with great taste in groups and single specimens on the lawn, and consist of all the species and varieties common in this part of China. The collection of Azaleas is particularly fine. During the summer time, when these plants are in bloom, they are placed on a stage, and protected from the sun and rain. They flower in great profusion; the individual flowers are larger, and the colours are more brilliant than they are at home. Here, too, are gorgeous specimens of the new Viburnums (V. plicatum and V. macrocephalum) sent home to Chiswick in 1845. The first English Apple tree fruited in this garden about a year ago.

The gentlemen connected with the London Missionary Society have a village of their own about a quarter of a mile back from the English town. Each house has a nice garden in front of it, full of interesting Chinese shrubs and trees. Dr. Lockhart has the finest collection.

These short statements are sufficient to show your readers what has been done since the last Chinese war. Chinese plants have not only been introduced to Europe and America, to enliven and beautify our parks and gardens, but we have also enriched those of the Celestial Empire with the productions of the west. Nothing, I believe, can give the Chinese a higher idea of our civilisation and attainments than our love for flowers, or tend more to create a kindly feeling between us and them.

Before all these gardens could be stocked, the demand for shrubs and trees has been necessarily great. Things which, in former days, were comparatively rare about Shanghae, have been brought down in boat-loads, and sold at very low prices. Good young plants of Cryptomeria, 3 to 4 feet in height, are sold for 30 cash each, about a penny of our money; 100 fine bushy plants of the new Gardenia just noticed have frequently been bought for a dollar. It is amusing to see the boat-loads of plants ranged along the river banks to tempt the eye of the English planter. They are chiefly brought from the large towns of Soo-chow and Hang-chow, the former 50 miles distant, and the latter about 100. "Heaven is above," says a Chinese proverb, "but below is Hang-chow and Soo-chow." *R. F.*

DISEASES OF PLANTS.

(*Continued from p.* 357.)

Fifth Species, RUSTY BLIGHT; and, *Sixth Species*, COAL BLIGHT OR CARBUNCLE.—From the earliest times, agriculturists have understood by *rust* in corn, those spots which appear on different kinds of grain, and are covered externally with a humour which either condenses and dries into a powder, or at other times never resolves into powder. I should confine the name of *rust* more specially to those spots which assume a yellowish, or brown-red, or rusty colour, and give that of *carbuncle* to those which are not only larger than the former, but blackish and covered with a black powder; this kind having appeared to me always the most injurious to corn. Wheat, Barley, and Oats suffer the most from it; but, if closely observed, other Gramineæ will be found to be affected by it. In damp valleys, and sometimes in mountain woods, whilst examining plants in my botanical excursions, I have observed gramineæ covered with yellow spots, which I have considered as *rust*. Some assert that where the *rust* appears the epidermis is wanting. Others have observed that the spots are always preceded by a little swelling in the form of a vesicle or pustule. The spots of rust are always longitudinal, and it has been said that they first commence in the form of yellowish dots. I have not had the opportunity of applying the microscope to the disease in its early stage, but with the naked eye I have not always found the pustules, and never seen the black dots. The first symptom which has presented itself to me has been a spot of very pale green.

I have united under one genus the above six species of blight, contrary to the course usually followed by writers on rural economy, and which I myself adopted in my essay on vegetable nosology. I have been induced to do so from a close examination of these diseases, which have, for the most part, shown similar symptoms. The yellow blight alone has no extraneous substance adhering to the surface of the spots. But in many cases the external blight has a humour like that of the rust, and in others the form and symptoms of the carbuncle. Thus in 1761 the leaves of the Pines of the forest of Ravenna were sprinkled with a dry tenacious exudation in the form of very white globules which were black inside. All these forms of disease may also be occasionally found on one individual at the same time. I once observed several Wheat plants, of which some leaves were infected with the dry rust, others with the carbuncle. The upper leaves had spots of the external blight without any appearance of exudation, although they were black, the chaff was covered with melume, and the grain was sadly spotted in the inside; and the finding these diseases thus united is not so rare as is supposed. I have not yet collected a sufficient number of facts, but it will probably be ascertained, as I myself believe, that all these diseases are but so many various symptoms of *one* malady, of which the last stage consists in the presence of them all. There is a kind of blight called honey-dew, which is no other than a liquid produced by aphides, although it has been erroneously confounded with the others by many authors, and this may be a further reason for distinguishing the latter under one genus. Finally, the cir-

cumstances under which we see plants become blighted, rusted, or yellow-spotted, being generally the same, may be considered as a farther proof that these diseases may be all one.

VILLA AND SUBURBAN GARDENING.

Few articles produced in the kitchen garden are more esteemed than Celery, especially if it be of good quality, a circumstance somewhat rare in the villa garden. How often do we find it sticky, hollow, and rusty, and not unfrequently running to seed, if planted at all early. These imperfections are imputed to the seed being bad, never, or rarely, to ill-management. From numerous trials with various varieties, I am led to conclude that good culture is, after all, the principal point to be kept in view in order to secure quality.

The red and white varieties sent out by Seymour are the best in cultivation. For the amateur, March will be found early enough for the first sowing, which may be made under a hand-glass on a slight hotbed, such as would be used for the raising of annuals, or a small portion of seed sown in a pan, and placed in a greenhouse, will accelerate its early vegetation. In either case when the plants are about 2 inches high, they must be pricked out on a warm border 3 inches apart, in a bed of light vegetable soil. Advantage should be taken of showery weather for this operation. Should bright sunshine follow, a slight shading should be resorted to for a few days, until they begin to root in their new quarters. Later sowings may be made in the open ground in April and May, and the same course of preparation pursued with the young plants. When the latter have become strong, and about 6 inches high, trenches must be prepared to receive them. An open situation will be found an eligible one. Mark out the trenches a foot wide, and at least 3 feet from trench to trench. Take out the soil a foot deep, and bank it up on either side of the trench. Then place 6 or 8 inches of rich decomposed manure in the bottom. This should then be well and carefully intermixed with the soil immediately beneath it, at least a foot deep; when this is done, the trenches will be ready for planting.

Take up the plants carefully with a trowel, retaining as much soil as possible about the roots, and at the same time securing all the fibres which can be retained. In planting, the trowel must be used to remove the soil so that the roots may be properly spread out; when the transplanting is finished, give the trench a good watering, to settle the soil about the roots. It is desirable, when taking up the young plants, and before transplanting them, to trim back the outside leaves; but this must be cautiously and not violently effected. The growth of Celery is greatly promoted by a plentiful supply of water, and liquid manure water has been found to accelerate its progress in an astonishing degree.

To produce Celery of the finest quality only a single row must be planted in a trench, and as it advances in growth it must be earthed up occasionally, care being taken not to smother the hearts of the plants; and in order to prevent this a boy should hold each plant with his hands, so that the foliage may be kept close together, and not embedded in the mould. Always select a dry day for the purpose of handing up. This operation may be continued with the first planted rows until the stems are covered 12 or 15 inches. The later crops will not require more than from 9 to 12 inches of soil. If this system is pursued in the culture of Celery, an article of first-rate quality will be produced, bearing in mind that a cardinal point is an abundant supply of moisture during dry weather. *Pharo.*

THE GUANO TRADE.

A Conversation.—*A.* Well my man, what do you want with me? *B.* Why, mister, I should like to spake to you by yourself, if *you* please. *A.* Oh! There is no one here but friends; you can say what you like. *B.* Don't you dale in guaner? *A.* Yes; and pretty considerably, I think. *B.* Well, then, what do you think of that there stuff? [*Producing a nice looking, pale brown, smooth powder, in a sample bag.*] That'll do, won't it? *A.* Do! my good man; do what? *B.* Why *you* know what wery well. [*Grinning.*] Wery like guaner, an't it? *A.* Oh! this is mixing stuff! Aye, aye! I see. Well, old fellow, what do you want for it? *B.* Why, master, that'll depend on how much you'll have. For a small lot, say 27*s.*; for a good lot, less. *A.* Twenty-seven shillings a ton! that will never do; Why, this is nothing but loam. How do you make it out to be worth 27*s.*? *B.* No, 'tan't loom—not altogether — there's more than that. You smell on it! Bless your soul, I was a 'mazing long while afore I larned the trick. You try, you ca'nt make such nice looking stuff as this out o' nothing but loom. *A.* Pooh; nonsense. *B.* Well, you try, then, that's all. But how much 'll you take? *A.* How much will you deliver at a pound a ton? That's the point. *B.* That's wery low, 'tis indeed, master. But I'll tell you what; if you'll take 1000 ton, I'll do it for a guinea. I'm sure you can wery well afford that, for you know you'll sell it for 9*l.* or 10*l.* *A.* Well, I'll think about it. Where do you live? [*Whispers clerk, who goes out.*] *B.* Oh, I lives Lambeth way. Here's my direction. No, I won't give you that, I'll call again. *A.* Very well, then call again to-morrow. [*Exit B, followed by clerk, who dodges him to —— wharf.*]

Home Correspondence.

The Manettii Rose Stock.—In reply to Mr. W. Paul on this stock, I can only give the result of double the number of years' experience he can have had with it, before I ventured to say anything about its qualities as a stock. I grew it for, I think, five or seven years; it has annually increased in favour, and I now decidedly think it will, with the hybrid Bourbon Rose Celine, entirely supersede the Dog-rose as a stock for dwarf Roses. There may be other hybrid Roses equally eligible, but they will not in general strike so freely from cuttings; in this respect, although the hybrid Rose Celine is very excellent, it is objectionable, as two-thirds of the cuttings often die. The best, not the "worst" quality of this stock is its great excitability, for it will grow well in the poorest soils, and may be budded freely in the driest seasons for pot-culture; for spring grafting, or the *greffe herbacée* (summer grafting) it is really invaluable; it does not here develope buds so rapidly as the Dog-rose, and after the first season requires but little care; but then I plant it in poor soils, and find it valuable on this account. I have near my house some borders on which Roses budded on the Dog-rose were cultivated for many years, till indeed the ground was thoroughly exhausted, and they refused to grow any longer. I gave these borders a dressing with sand from my sand-pit—no manure—and planted them with Manettii stocks; these were budded last season; one bed with 1000 of the Rose Géant des Batailles. Their state is perfect; they are not too robust; they have not the "hectic glow;" and next season they will, I have no doubt, come forth with "pristine vigour." I am much older than Mr. W. Paul; for "time has thinned my hair." I cannot turn fine periods; but I can give an account of what I see and practise. A Persian yellow Rose, now six years old, on the Manettii stock, is now in fine health; has never given a sucker from its roots, and the last four years not a shoot from its stem. Lady Alice Peel, and other Hybrid Perpetuals, from four to five years old, are in perfect health, the stock swelling with the head. They have never given a sucker from their roots, and but rarely a shoot from their stems. The Hybrid Perpetuals Comte de Paris, Dr. Marjolin, and several others that make but feeble growth on the Dog-rose, on the Manettii grow well and bloom admirably. What can we want more? These discussions about stocks in your columns are very proper, for they often elicit valuable facts. We have yet much to learn. *Thomas Rivers.*

The Weather.—I observe in your Paper a wide range of temperature registered during the week ending June 6; and on two occasions a great degree of cold is recorded. This occurred on the nights of the 1st and 3d; the former being 38°, and the latter 37°. The following is the temperature during the same week at Pimlico, and, for the sake of comparison, I have added that at Chiswick:

	Pimlico.			Chiswick.		
		Max.	Min.		Max.	Min.
May	31	75°	49°	31	76°	41°
June	1	73	48	1	74	38
	2	73	49	2	76	40
	3	74	48	3	75	37
	4	75	51	4	78	44
	5	77	56	5	78	55
	6	67	48	6	62	49

I have frequently observed, by your Journal, a great degree of cold occurring at Chiswick at night. Is it because Chiswick, being so near the Thames, is exposed to cold winds off the water as soon as the sun goes down? My thermometer is a self-registering one, and at night hangs outside a second-floor window, exposed westerly perhaps, 35 feet from the ground; in the morning I remove it to a wall in the garden, about 5 feet from the ground, because, if suffered to remain during the day where it hangs at night, the sun in the afternoon would shine upon it. It was bought at Casella's, in Hatton-garden, and is a correct one. It coincides with all I see hanging out at the different opticians' shops. All my temperatures are shade temperatures. *A Young Gardener.*

Cuthill's Black Prince Strawberry.—Although the early blossoms of this very prolific Strawberry were cut off by frost on the 10th of May, I am able to send you a basket of perfectly ripe fruit from the open ground, where they have had no artificial assistance in ripening whatever. My first gathering was made on the 10th inst. *J. Cuthill, Camberwell, June* 12. [Very good they were.]

Destruction of Ants.—I have suffered much trouble and inconvenience by being visited with these pests in my underground apartments, and I have tried many remedies, such as tobacco-water, poisoned sweets, as honey, &c., but all without success. I then directed my attacks to the outside of the house. I dug a trench the whole length of the wall. I then poured a good supply of hot water into the trench, which completely saturated the earth, and might have destroyed some of my little enemies; still I do not think that leaving them at this stage would have completed the business. I procured an iron rod, and, the earth being softened by the water, I forced the rod 3 or 4 feet through the bottom of the trench, and thus pierced holes all along the house, and by these means probed to the foundation. I then obtained from the gas-works a quantity of water which had been used in their purifying process. I poured this into the holes I had made, and, in filling up the trench, I well mixed the gas-tar water with the mould. I soon found the numerous army was retreating. Still, for a few days, I thought I had not succeeded, as the number appeared to have increased; the colony, however, bore the appearance of confusion; the numbers afterwards daily decreased, and now I am quite rid of my foes. They consisted of the black or very dark kind of ant. *Achores.*

Portable Greenhouse.—I have seen mentioned somewhere, under this heading, a French contrivance, consisting of one or more oil lamps, warming a pan of water, and above the water again a pan of sand, in which to plunge flower-pots; the whole covered by a large hand-glass. You will oblige me by saying whether some such plan is likely to answer for the purposes of striking cuttings, raising tender annuals from seed, and occasionally as a seed bed for Melons and Cucumbers. If you think it is likely to answer, will you add whether such things are kept by any tradesman, whether a dwelling-room will be an unsuitable place for it, and to what heat I must have the means of raising the water, in order to secure enough of bottom heat; also whether the glass ought to have the means of ventilation at the top, and any other conditions of success which may occur to you. If the plan is a good one, it may perhaps be worth the notice of your excellent contributor, "Pharo;" as, if useful to any one, it will be so to those for whom his articles are designed. An apparatus only 18 inches by 12 inches will hold 24 3-inch pots, and may be used for four or five successive batches of cuttings in one season, which will probably supply the wants of a large proportion of your readers. *T. P.* [Such a contrivance was mentioned by us, on French authority, some years since. It could hardly fail to answer.]

Statice armeria.—One of my young men has brought me a few plants, with flowers nearly pure white, and some slightly tinged with pink; they were found growing on the shore of Belfast Lough, between Bangor and Donaghadee. Perhaps some of your correspondents will inform me whether it is common or not, as I have not seen any of it before. Many interesting plants are to be found round this part of that fine but unfortunate country. *Pride, Bangor Castle, Down, June* 8.

Way in which Toads Shed their Skins.—At p. 181 of the *Gardeners' Chronicle* for this year is an account, by W. Turner, of the manner in which he saw a toad shed its skin. This statement does not materially differ from that given in Bell's "British Reptiles," except in one point. Bell describes the cuticle as "pushed by the two hands into the mouth in a little ball, and swallowed at a single gulp." I have this morning witnessed an exhibition of this remarkable economy in the disposal of his old clothes, by one of the large Jersey toads, of which I received two living specimens a few days ago. Observing the back parts of the animal to be bright and moist, and seeing it raise its hand, as if to scratch its back, I at once perceived what was going on, and summoned my family to witness the process. The toad continued at intervals of a few seconds to open its mouth wide, and at the same time to assist the removal of the cuticle, by stretching its arm and contorting its body, much in the way we see our amateur boatmen of the Cam divest themselves of those seamless knitted jackets, which they pass over their heads. A great part of the cuticle had already disappeared from the hinder quarters, and I observed a continuous and almost imperceptibly slow progression of what remained round one of the corners of the mouth and down the throat. In this way the cuticle became removed in proportion as it was detached. The whole of the left side was cleared first, with the exception of a small tattered fragment that adhered round the fingers, and which I did not observe to be removed by the mouth. The right arm was then more successfully liberated, the cuticle slowly disappearing round the right angle of the mouth, much as we might fancy a long strip of ribbon maccaroni would descend if carefully swallowed without a rupture. I did not notice any direct pushing of the cuticle by the hands into the mouth; nor yet any pellet formed of it, to be bolted at a single gulp. Whether there has been any mistake in the description of the process adopted by our English toads I will not venture to assert, but certainly my own pet swallowed his Jersey jacket in a very gradual and deliberate manner. *J. S. Henslow, Hitcham, March* 11.

Irish Peat Charcoal.—The fertilising qualities of peat charcoal, even in its plain state, are very great; but when mixed with night-soil, its good properties are of course much increased, and in the latter condition a less quantity is required for an acre. Farmers often fail in raising small seeds, Turnips, for instance; more especially in the south of England. The Turnip seeds are sown in a poor hot soil, without any stimulant being immediately available. The seeds in consequence vegetate slowly, giving the fly time to eat the seed-leaf before the rough leaves have been produced. This can only take place in poor soils. On the other hand, market gardeners never fail in obtaining excellent crops, however hot the weather may be, a result owing entirely to their land being rich. This fact, therefore, should induce farmers to mix their small seeds with powdered peat charcoal before they sow them, all complaints of their failing then would cease. Everything ought to be done that can be done to stimulate young plants. They cannot grow too fast. Farmers, like gardeners, do not want to occupy the land six months with one crop, if the same can be grown in four. Charred peat might be used in many ways. It might be employed with advantage in cow-houses, piggeries, and in dung-heaps. When Potatoes are planted, if charred peat is used instead of dung, the young crop will have none of those scabby appearances which always occur where dung is used in the furrow; and the latter offers a great harbour for all sorts of insects. Mr. Smith, of Deanston, informs me that, in the island of Lewis, he is burning peat and using the ashes as manure, after

the plan which I recommended two years ago. It answers admirably. The farmers of the south of England have no idea what peat moss or bog is; they imagine that it is simply heath soil, which is a poor, sandy, black mould, generally covering the surface of the ground, not more than 6 or 8 inches deep. On the other hand, I have seen peat moss 20 feet deep, and in some places 30; all being one solid black mass. The Irish Amelioration Society ought to manufacture two sizes, one as large as the lump sugar we put into our tea; this size would keep strong clay land opener, warmer, and drier; the lumps of peat would also retain moisture in the earth longer in hot dry weather, and pieces of this size would be more lasting as a fertiliser. The smaller size would suit light land, and would be serviceable for top dressings. It would be a pity to burn such valuable manure, or it could be easily compressed in a machine and dried; it might then be bought in London readily, and it makes the best of fuel. If Mr. Rogers's plan of mixing the charred peat with night-soil could be carried out on a large scale, it would be much better than allowing the night-soil to be emptied into the common sewers, making them what may be termed elongated cesspools, from whose chimneys or "gully holes" are evolved the most deleterious gases. Peat charcoal has been proved to be a perfect deodoriser, and mixed with this material our town filth might be carted to the country and made available at once. This is the more necessary, as the hardness of the times will not now allow the farmer to send his waggon and four horses, with a man or two, to fetch home a load of dung, much of the goodness of which has been washed and heated out of it. For my own part, I have for some years used nothing but liquid manure water, salt, soot, and wood ashes, but now I shall employ charred peat. All the plants I cultivate grow most luxuriantly in it plain as well as mixed with night-soil. To amateurs I am sure it will prove a boon, as it will do away with the filth and nuisance of dung. *James Cuthill, Camberwell, London.*

Leaking in a Swimming Bath.—I should be obliged by some information as to the best mode of preventing leaking in a swimming bath. The bath is situated in an old quarry, one side being good rock, from whence flows the stream which supplies the bath. The other sides and the bed of the quarry are entirely composed of rotten stuff and rubbish, which, notwithstanding constant puddling, is continually breaking away at the sides, and letting the water out. The size of the bath is 16 by 18 yards, and it ought to be 8 feet deep. Different cements have been repeatedly advertised in your paper, but I shall be glad to know if they will hold so much water. *J. C. C., Wales.*

Societies.

HORTICULTURAL: GARDEN EXHIBITION, *June* 8.—The leading features of this, in all respects, excellent Midsummer show being touched upon in another column, we shall, as before, confine ourselves here strictly to details.

In collections of 20 STOVE AND GREENHOUSE PLANTS, the first prize was awarded to Mr. May, gr. to Mrs. Lawrence, of Ealing-park, for a group, beautifully bloomed, and, with perhaps two exceptions, exhibiting the very best cultivation. At the back stood an enormous Epacris grandiflora (not the same plant which was exhibited in May), well furnished with foliage and blossoms to the very pot; supporting it on one side was an immense Polygala acuminata, quite a mass of purple flowers, and on the other, an equally fine Coleonema rubrum. In front were Ixora coccinea, richly ornamented with noble heads of scarlet flowers; the purple blossomed variety of Aphelexis macrantha, the best of all the Everlastings; a pyramidal Eriostemon buxifolium, a well flowered Pimelea spectabilis, at least 4 feet across and as much in height; Erica Bergiana, 3 feet high and as much through, covered with small round rosy-purple blossoms; the clear yellow Allamanda grandiflora, the blossoms of which suffered much from exposure, the plant having been brought out of a close warm house; Epacris miniata, by far the most brilliant of the genus; a beautiful blue Leschenaultia, and a plant of the red variety, forming quite a globe of flowers; a capital bush of the rosy-pink Pimelea Hendersoni, a yellow Cape Heath, the fragrant Adenandra, a small Chorozema ovata, loosely supported on a few sticks so as to form a well flowered little bush; the sweet scented Sphenotoma gracilis, Franciscea acuminata, and Azalea variegata.—The second prize was awarded to Mr. Cole, gr. to H. Colyer, Esq., of Dartford, for evenly grown plants, approaching so closely the perfection of those from Ealing-park that when they were first staged in the morning some persons imagined that they would be placed first. At the top was an Allamanda Schottii with bright yellow blossoms nearly 6 inches across, and in front an excellent Stephanotis floribunda, also beautiful plants of Dipladenia crassinoda, Pimelea Hendersoni, Ixora coccinea and crocata, Gledstane's Azalea, a large spreading Pimelea decussata, the Box-leaved Eriostemon, not very thickly flowered; two capital Everlastings, a good plant of the red-blossomed Leschenaultia, the beautiful Echites splendens with six open flowers on it; Sphenotoma gracilis, Chironia glutinosa, Chorozema Henchmanni, Crowea saligna, a good plant, but insufficiently in bloom; the showy Clerodendron squamatum, and a Cape Heath.—A third collection was contributed by Messrs. Frazer, of Lea-bridge. It consisted of the large flowered Epacris, two red Azaleas, Ixora coccinea, Chorozema varium, the yellow-blossomed Hibbertia Cunninghami, Erica Cavendishii, and a variety of E. Linnæoides, Polygala acuminata, an Everlasting, Henderson's Pimelea, the white-flowered Lachnæa eriocephala, Gompholobium polymorphum, in the shape of a dwarf bush, supported by a few sticks; Franciscea acuminata, Boronia pinnata, the Jasmine-like Rhynchospermum, and Hypocalymna robustum.—Mr. Pamplin, of Lea-bridge-road, sent a fourth group, in which were the opposite-leaved Polygala, a large white Heath, the woolly Pimelea (P. lanata), Epacris miniata, the brilliant red Azalea called optima, a neat well-flowered Erica cubica minor, the Box-leaved Eriostemon, two Vincas, the fragrant Stephanotis floribunda, and a few other plants.

In collections of 15 STOVE AND GREENHOUSE PLANTS, the first prize was awarded to Mr. Green, gr. to Sir E. Antrobus, Bart., of Cheam. In this group we remarked well managed plants of the large flowered Allamanda, Rondeletia speciosa, Stephanotis floribunda, the best of all climbers for the roof or stove, when it can be planted out in the bed; Epacris miniata, two Helichrysums, Sphenotoma gracilis, the opposite-leaved Polygala, Wilson's excellent variety of Erica tricolor, Chorozema varium, Leschenaultia formosa, Henderson's Pimelea, Erica depressa, Ixora coccinea, and the variegated Azalea.—Mr. Gerrie, gr. to Sir J. Cathcart, Bart., sent the next best group, in which were five varieties of Cape Heath, the flesh-coloured Gloxinia, Sollya linearis, insufficiently in bloom; the red and white Vincas, a large Stephanotis floribunda, Epacris miniata, a small Gardenia radicans, and Adenandra uniflora.

In the class of 10 STOVE AND GREENHOUSE PLANTS there were seven exhibitors, all of whom sent creditable collections. A Gold Banksian Medal was awarded to Mr. Carson, gr. to W. F. G. Farmer, Esq., of Cheam, for large and well managed plants of Polygala oppositifolia, Allamanda cathartica, Epacris grandiflora, the Anemone-leaved Boronia, a purple Everlasting, Leschenaultia formosa, and the best variety of L. biloba; Sphenotoma gracilis; a small Ixora coccinea, with 13 fine heads of flowers, and the showy Medinill (M. speciosa). A second prize was assigned to Mr. Taylor, gr. to J. Coster, Esq., of Streatham, for a group in which were a beautiful Erica Westphalingia, quite a mass of bright crimson blossoms; E. Cavendishii, a red Azalea gracilis, a large bush of the opposite-leaved Polygala, the white-blossomed Pavetta caffra, Boronia serrulata, Azalea variegata, a purple-flowered Helichrysum, and Leschenaultia formosa. The next group in point of merit came from Mr. Bruce, gr. to B. Miller, Esq., of Tooting. We remarked in it good plants of Pimelea Hendersoni, Ixora coccinea, Acrophyllum venosum, Gompholobium polymorphum, trained over an egg-shaped trellis; Leschenaultia formosa, two Helichrysums, Epacris heteronema, and Chorozema varium.—Mr. Malyon, gr. to T. Brandram, Esq., of Blackheath, sent well cultivated plants of Phymatanthus tricolor, forming quite a little globe of flowers; Aphelexis humilis; Erica elegans and E. propendens, the latter loaded with small pink bells; Epacris miniata, the still somewhat scarce Aotus gracillima, Azalea lateritia, Polygala cordifolia, Chorozema varium, and Pimelea linifolia. Mr. Stanly, gr. to H. Berens, Esq., Sidcup, Kent, produced the large-flowered Epacris, two red Azaleas, the rose-coloured Vinca, Henderson's Pimelea, the useful Franciscea augusta, a Cape Heath, and small plants of Leschenaultia formosa and Boronia serrulata.—Mr. Glendinning, of the Chiswick Nursery, Turnham-green, furnished Pimelea Hendersoni, Tremandra verticillata, Aphelexis humilis, Erica splendens, the blue Leschenaultia, Gledstane's Azalea, Polygala cordifolia, Erica Cavendishii, E. perspicua nana, and Gesnera microrhiza.—Finally, from Mr. Stuart, gr. to T. Huggins, Esq., of Norwood, came Gompholobium polymorphum, on a large circular trellis; a pretty good Epacris miniata, a nice little plant of Mason's Heath, Bossiæa linophylla, a small but good Aphelexis macrantha purpurea, Erica Cavendishii, Leschenaultia formosa, and Zichya longipedunculata.

In collections of six STOVE AND GREENHOUSE PLANTS, the first prize was awarded to Mr. Kinghorn, gr. to the Earl of Kilmorey, Orleans House, Twickenham, for a large and fine Erica Cavendishii in a tub, the large-flowered Epacris, a flat and spreading Azalea Gledstanesii, Leschenaultia formosa, a little cone of flowers; Aphelexis humilis, and a charming bush of the violet blossomed Tremandra verticillata.—Second, Mr. May, gr. to E. Goodhart, Esq., Beckenham, Kent, for Ixora coccinea, Pimelea Hendersoni, Erica Cavendishii, Chironia glutinosa, Aphelexis sesamoides, and Acrophyllum venosum.—Third, Mr. Young, gr. to C. Baron, Esq., Denmark-hill, Camberwell, for Coleonema rubrum, Polygala cordifolia, Pimelea decussata, Franciscea villosa, and Erica ventricosa alba.—Fourth, Mr. Epps, of Maidstone, for a small Pimelea Hendersoni, covered with blossoms; P. mirabilis, a seldom seen species; a double red Azalea, and Aphelexis macrantha purpurea.—Equal prizes were awarded to Mr. Hamp, gr. to J. Thorne, Esq., and to Mr. Speed, of Edmonton. In these two groups we remarked a well flowered Erica Cavendishii, Ixora coccinea, a large Pimelea decussata, Mr. Fortune's Gardenia, an Everlasting, Clerodendron fallax, Tremandra verticillata, the rose-coloured Vinca, two Cape Heaths, and Chironia glutinosa.

HELICHRYSUMS.—Collections were shown by Messrs. Green (1), Young (2), Cole (3), and Stanly (4). In these we remarked Aphelexis sesamoides purpurea, humilis, and its large flowered variety, argentea; macrantha purpurea, spectabilis grandiflora, and Phænocoma proliferum.

ORCHIDS.—Fine as these were in May, they were far excelled both in quality and quantity on Saturday last. Mr. Holford's gr. Bassett produced a Camarotis purpurea 5 feet in height, quite a pyramid of purple flowers from the top to the bottom. This formed, as well it might, an object of general admiration. Scarcely inferior to it was an Odontoglossum citrosmum in the collection of Mr. Mylam, gr. to S. Rucker, Esq. This had five glorious spikes of flowers on it, and they were most beautifully coloured. Indeed the amount of colour which they possessed formed a distinguishing characteristic of all Mr. Mylam's productions. His yellows were decidedly yellows, his purples purples, and his pinks pinks. Each colour, whatever it might be, was "brought distinctly out." By this means even Vanda cristata, usually a dingy looking plant, was, in Mr. Mylam's hands, really chatming. But in addition to his plants exhibiting to the best advantage all the colours which they naturally possessed; they were capitally cultivated and flowered, and on this account richly deserved the Large Gold Medal which was awarded them. The group comprised, in addition to the Odontoglossum citrosmum and Vanda cristata above alluded to, Cattleya violacea, with six spikes of handsome flowers; C. Mossiæ, with from 17 to 20 expanded blossoms; the true C. intermedia, C. candida, Dendrobium formosum, with some 20 blossoms on it, large and beautiful; the rare Anguloa Clowesii, with three yellow blossoms; a copiously bloomed Barkeria spectabilis, in a wire basket; the same excellent Saccolabium præmorsum that was produced on the 18th of May, still in perfection; the rare Aerides maculosum, and Odontoglossum Karwinskii; the large flowered Butterfly plant (Phalænopsis grandiflora), Cypripedium barbatum, a large Aerides affine, A. odoratum, a tall Vanda teres, and Brassia verrucosa. The second prize was awarded to Mr. Blake, gr. to J. Schröder, Esq., of Stratford, for the large blossomed Phalænopsis, Aerides maculosum, A. odoratum, crispum, and a variety called Schröderi; Saccolabium præmorsum and S. guttatum, Barkeria spectabilis, Anguloa Clowesii, with three open blossoms, and one about to expand; and a beautiful specimen of the white flowered Calanthe veratrifolia.—Mr. Williams, gr. to C. B. Warner, Esq., of Hoddesdon, obtained a third prize, for Maxillaria tenuifolia, an Odontoglossum citrosmum which had lost all its colour, and was perfectly white. Several finely flowered species of Brassia, the scarce Cœlogyne Lowei, the charming Dendrobium Devonianum, an Oncidium or two, Aerides crispum, and Cattleya Mossiæ—the latter, although it had been fine, was rather past its best.—In the Nurserymen's Class of 15 Orchids there were three exhibitors, Messrs. Veitch, Rollisson, and Dobson. The Exeter group consisted of the rare Cattleya Acklandiæ, a handsome species; a small plant of the as yet scarce transparent Dendrobe, a large Sobralia macrantha, Cattleya veratrifolia, a conically trained plant of the beautiful Dendrobium Devonianum, Oncidium sphacelatum, with seven spikes of brown and yellow flowers; the larger variety of Oncidium ampliatum, Aerides crispum, Saccolabium guttatum and præmorsum, the bearded Lady's Slipper (Cypripedium barbatum), Lacæna bicolor, and a miserable Barkeria spectabilis.—Messrs. Rollisson sent a large Dendrobium moschatum, D. Devonianum, and D. formosum; Oncidium divaricatum, one of the handsomest of the small brown and yellow kinds; the violet-flowered Huntleya, with six shell-like blossoms; Stanhopea tigrina, a large Aerides odoratum, the spotted variety of Oncidium luridum, and one or two other plants.—Mr. Dobson had his large and fine Dendrobium nobile, which was produced on the 18th of May last, still in perfection; also a beautiful specimen of the large flowered variety of Oncidium ampliatum, a fine example of Aerides crispum, the orange-blossomed Epidendrum vitellinum, E. crassifolium, and a few less striking plants.

Collections of 10 ORCHIDS were contributed by Mr. Carson, gr. to W. F. G. Farmer, Esq., and Mr. Franklin, gr. to Mrs. Lawrence. Mr. Carson produced an Acanthophippium bicolor, covering the surface of the pot with curiously formed red and yellow blossoms; the bearded Lady's Slipper (Cypripedium barbatum); the large flowered Phalænopsis, Oncidium divaricatum and flexuosum, Saccolabium guttatum, a large and fine Aeridus odoratum, the rose coloured variety of Epidendrum macrochilum, Lacæna bicolor, with two noble spikes of flower, and an Odontoglossum.—Mr. Franklin furnished small plants of Phalænopsis grandiflora, Oncidium divaricatum, Odontoglossum citrosmum, two varieties of Cattleya Mossiæ, the tortuous flowered Trichopil (T. tortiliflora), Stanhopea oculata, Aerides crispum, and Dendrobium pulchellum.

Groups of six ORCHIDS were communicated by Mr. Gerrie, gr. to Sir J. Cathcart, Bt., and Mr. Kinghorn, gr. to the Earl of Kilmorey. The former had a capital Stanhopea oculata, but it was not forward enough; another species of Stanhopea, Cattleya Mossiæ, two Oncids, and Saccolabium guttatum.—Mr. Kinghorn sent Cattleya Mossiæ rather past its best, Calanthe veratrifolia, the large flowered Phalænopsis, and a Stanhopea in the way of Wardii.

Specimen ORCHIDS consisted of the noble Camarotis purpurea, already alluded to, from Mr. Bassett; a good Dendrobium speciosum, from Mr. Cole; Oncidium flexuosum, from Mr. Bruce; Cattleya Mossiæ, from Mr. Frazer, gr. to J. L. Leigh, Esq.; Dendrobium nobile, from Mr. Green; and an Aerides crispum, from Mr. Dobson, gardener to Mr. Beck.

Azaleas.—Collections of six were shown by Mr. Green and Mr. May, gr. to Mrs. Lawrence, and although past their best, they made a good display. The two groups were again nearly equal in point of merit. Mr. Green's kinds were Apollo, decora, variegata, lateritia, optima, and rosea punctata. Mr. May had fulgens, decora, Minerva, variegata, coronata, and Gledstanesii. —Messrs Lee, of Hammersmith, had a seedling called "Symmetry," apparently a considerable improvement on lateritia, which it very much resembles.

Tall Cacti in flower were shown by Mr. Green. They consisted of Epiphyllum Russellianum, Jenkinsoni, Ackermanni, and rubrum cæruleum; Cereus speciosissimus and C. Egertonii, the latter a beautiful variety, at present but little known.—Mr. Hoyle, of Reading, showed a seedling Epiphyllum called "platypetalum," a most brilliant coloured variety.

Roses, although good, wanted the richness and beauty which they possessed in May. The plants then exhibited were past, and the interval between the May show and the present was too short to admit of fresh plants being brought nicely into flower. Nevertheless the exhibitions of Messrs. Lane and Francis were very nearly in perfection, and so were those of Messrs. Rowland, Roser, and Terry. The boxes of cut blooms from Mr. Terry and others, maintained their condition throughout the day, and were much admired. Among the different varieties shown we observed Aubernon, Fulgens, Duc de Cazes, Coupe de Hebe, Mrs. Elliott, Madame Laffay, Blairii No. 2, Triomphe de la Queue, William Jesse, &c.; and among yellows La Pactole, Persian, Smith's, Pauline Plantier, Vicomtesse de Cazes, and Harrisonii. Several collections of yellows were disqualified on account of their not being exhibited according to the regulations.

Cape Heaths were plentiful, well cultivated, and finely flowered. Those in 11-inch pots consisted mostly of small plants; but they were generally perfect examples of good Heath growing.—In collections of 10 varieties, a first prize was awarded to Mr. Smith, gr. to J. Quilter, Esq., of Norwood, for beautiful plants of elegans, Bergiana, vestita coccinea, v. alba, suaveolens, Cavendishii, metulæflora, perspicua, Westphalingia, and Bruneoides. Second, Mr. Mylam, gr. to S. Rucker, Esq., for tricolor rubra, t. Wilsonii, Cavendishii, halicacaba, jasminoides, ventricosa hirsuta, v. grandiflora, inflata rubra, &c. Mr. Cole was third, with Cavendishii, Wilson's tricolor, t. rubra, Bergiana, gemmifera, and splendens. — Among Nurserymen, Mr. Epps was first, with good plants of splendens, perspicua nana, vestita coccinea, propendens, ventricosa alba, ampullacea vittata, Cavendishii, tricolor dumosa, and ventricosa coccinea minor. Messrs. Rollisson, who were second, had ventricosa hirsuta, v. prægnans-superba, v. breviflora, v. grandiflora, Cavendishii, tricolor, amabilis, Beaumontiana, and ampullacea nana. Messrs. Veitch were third, with densa, a distinct looking species; rubella, a minute rosy-flowered kind; splendens, depressa, florida, ventricosa grandiflora, Cavendishii, and metulæflora. — Messrs. Fairbairn produced perspicua nana, tricolor, depressa, Bergiana, Cavendishii, mutabilis, elegans, Beaumontiana, and ventricosa breviflora. Mr. Epps showed three pretty seedlings; one more especially, called tricolor Eppsii, is a promising flower.

Single Specimens consisted of splendid plants of Aphelexis purpurea and of Erica depressa, from Mr. May, gr. to E. Goodhart, Esq.; a charming Indigofera decora, from Mr. Ivison, gr. to the Duchess Dowager of Northumberland, at Syon; the best variety of the blue Leschenaultia, from Mr. May, gr. to Mrs. Lawrence; Aphelexis humilis, from Mr. Bruce; Pimelea decussata, from Mr. Hill, gr. to T. Davies, Esq.; Polygala acuminata, from Mrs. Lawrence; an Everlasting and Chironia glutinosa, from Mr. Cole; Erica depressa, from Mr. Green; the same species of Cape Heath, from Messrs. Fairbairn; Epiphyllum Jenkinsoni, from Mr. Collins, gr. to Miss Elliotson, of Clapham, and a large Coleonema, from Mr. Terry, gr. to Lady Puller.

New Plants.— Mr. Ivison, gr. to the Duchess Dowager of Northumberland, at Syon, again sent a flower and two leaves (one inverted so as to show the under surface) of the queen of aquatics (Victoria Regia); also a pink-blossomed Bejaria, which was probably B. Lindeniana, but its flowers were not expanded enough to allow a correct opinion to be formed of it.—Mr. Cole, gr. to H. Colyer, Esq., had Roupellia grata, a plant possessing little beauty.—Messrs. Veitch, their Jasmine-flowered Rhododendron, and Dipladenia nobilis, but, although very handsome, the latter was not sufficiently new to be noticed by the judges.—Mr. Glendinning, of Chiswick Nursery, and Mr. Henderson, of St. John's-wood, furnished the white variety of Campanula nobilis.—Messrs Garaway, of Bristol, Achimenes grandis, and Messrs. Frazer, of Lea-bridge, Hypocalyptus obcordatus, not a new plant.

Miscellaneous Subjects.—Nepenthes sanguinea, a noble species, with great pitchers that would hold more than a pint, of a warm brown colour outside, and mottled with purple inside, from Messrs. Veitch. Also a truss of a rose coloured Rhododendron from the same nurserymen. A large mass of Platycerium grande attached to a circular board, and a tubful of Nymphæa cærulea, finely in flower, from Mr. Ivison. An assortment of Iris blooms from Mr. Salter, of Hammersmith; variegated and alpine plants from Mr. Wood, of Norwood; and alpines from Mr. Turner, of Holloway, and from Mr. Turner, of Barnet, Herts. A beautifully flowered plant of the curious Gloxinia Fyfiana from Mr. Dobson, gr. to Mr. Beck; six Amaryllids from Messrs. Garaway, of Bristol; Dielytra spectabilis from Mr. Mountjoy, of Ealing; and an ornamental glass Fern case, on the principle of Dr. Ward's invention, from Mr. Cogan, of Leicester-square.

Pelargoniums were shown in excellent condition, and formed one of the most attractive features of the exhibition. Mr. Cock, of Chiswick, obtained the 1st prize for six plants in 8-inch pots, beautifully grown and well flowered, of Gulielma, Rosamond, Orion, Mont Blanc No. 2, Centurion, and Sikh; a 2d prize was awarded to Mr. Black, gr. to E. Foster, Esq., Clewer Manor, Windsor, for six superior kinds, but they were not sufficiently in flower. They consisted of Gipsy Bride, Constance, Narcissus, Alonzo, Victory, and Ariel; 3d, to Mr. Stains, Middlesex-place, New-road, for Negress, Orion, Alonzo, Pearl, Victory, and Rosamond; 4th, to Mr. Robinson, Pimlico, for Rosetta Superb, Gulielma, Forget-me-not, Negress, Pearl, and Orion.—Six plants in 11-inch pots: 1st, to Mr. Cock (the only exhibitor in this class), for Rosamond, Pictum, Salamander, Centurion, Thisbe, and Pearl. Nurserymen.—Six plants in 8-inch pots: 1st, to Mr. Beck, of Isleworth, for Rosalind, Emily, Delicatissimum, Prince Arthur, Mont Blanc, and Star; 2d, to Mr. Bragg, of Slough, for Centurion (Beck), Gulielma (Beck), Pearl, Phyllis, Norah, and Marian.—Six plants in 11-inch pots: one exhibitor, Mr. Gaines, Gulielma, Model, Miss Holford, Negress, Emma, and Aspasia.

Fancy Pelargoniums: 1st, to Mr. Robinson for capitally managed plants of Fairy Queen, Queen Superb, Madame Miellez, Statiaski, Reine de Francais, and Anais; 2d, to Mr. Gaines for Orestes, Priam, Hero of Surrey, Odoratum magnificum, Elegans, and Reine de Francais; 3d, to Mr. Ambrose, of Battersea, for Madame Miellez, Magnificum, Anais, Defiance, Jenny Lind, and Ibrahim Pacha; 4th, to Mr. Stains, for Jehu, Superb, Statiaski, Madame Miellez, Queen Victoria, Bouquet tout fait, and Yeatmanianum grandiflorum.

Cape Pelargoniums were exhibited by Mr. Parker, Mr. Stanly, Mr. Stains, and Mr. Malyon. Among these were well cultivated plants of elatum, roseum, glaucum, Blandfordianum, tricolor, reniforme, flexuosum, ardens, bipinnatifidum, quinquevulnerum, glaucifolium, and others.

Calceolarias.—By far the best collection was contributed by Mr. Franklin, gr. to Mrs. Lawrence; but unfortunately it was disqualified, on account of the plants being in pots larger than the regulations allowed. Each plant was an example of the most perfect cultivation, good foliage, dwarf, and bearing heads of flower from 2 to nearly 3 feet in diameter. The sorts were—Catherine Seaton, Earl of Roslyn, Queen Victoria, elegans, Baron Renfrew, and Lucy Ashton. Mr. Gaines, who received the first prize, had Regulator, Pantha, Baron Eden, and Nil desperandum, &c. Mr. Glendinning, Full Moon, Lady Gray, Homer, Mulberry, Marquess of Abercorn, and Lord Cockburn. Mr. Stanly sent Sebastian, Solicitor-General, Chancellor, Beauty, Attraction, and Canary.

Seedling Florist Flowers.—A tent was devoted exclusively to the exhibition of these, an arrangement which appeared to give general satisfaction. As usual the principal occupants were seedling Pelargoniums. Mr. Beck had Incomparable, a rich bright crimson of fine shape, but perhaps a little inconstant; also Tyrian Queen, a fine purple but bad in form; Major Domo, rose, very large and a free flowerer.—Mr. Hoyle exhibited Ajax, a very dark purple, of good shape and a free bloomer; Nectar Cup, rose or fawn colour, a pleasing variety of good form; also Ocellatum and May Queen, which have been noticed before.— Mr. Ponty sent Prince Arthur, a good shaped rose with a clear white throat.—Several fancy varieties were staged, but they did not appear to be any improvement on those already in cultivation. Some Fuchsias and Petunias were shown, about which we have nothing to state.

Fruit, with a few exceptions, was not above mediocrity. A well-formed Providence Pine-apple, weighing 9 lbs. 11 oz., was exhibited by Mr. Chapman, gr. to J. B. Glegg, Esq.; Mr. Davis, gr. to Lord Boston, had the same variety of Pine-apple, weighing 8 lbs. 3 oz.; and Mr. Slowe, gr. to R. W. Baker, Esq., another Providence, weighing 6 lbs. 11 oz. — In the Market Gardeners' class, Mr. Davis, of Oak-hill, East Barnet, produced a Providence weighing 6 lbs. 12 oz. The same grower also had a Queen, 2 lbs. 14 oz., and a Black Jamaica, 2 lbs. 8 oz. Mr. Rust, gr. to J. Maclaren, Esq., sent a Queen weighing 3 lbs.; and Mr. Brewin, gr. to R. Gunter, Esq., the same kind of fruit, weighing 2 lbs. 12 oz.

Grapes. — Fine bunches of Black Hamburgh and Black Prince were exhibited by Mr. Frost, gr. to Lady Grenville, at Dropmore; Black Hamburgh by Mr. Stent, gr. to W. Herbert, Esq., of Clapham; the same variety by Mr. Foggo, gr. to the Marquis of Abercorn; Black Hamburgh, good Muscats, white Muscadines, and Black St. Peter's, by Mr. Rust, gr. to J. Maclaren, Esq.; Black Hamburgh by Mr. Turnbull, gr. to the Duke of Marlborough, at Blenheim; the same variety, Dutch Sweetwater, and Muscat of Alexandria, by Mr. Brewin; tolerably good Muscats by Mr. Kemp, gr. to Mrs. Grillion; Stillwell's Sweetwater and Muscat of Alexandria, by Mr. M'Walter, gr. to Col. Challoner; and Chasselas Musqué by Mr. Chapman, gr. to J. B. Glegg, Esq.—In the Market Gardeners' class, Mr. Davis, of Oak Hill, produced excellent Black Hamburgh; Mr. Toy, Oatlands Palace-gardens, Weybridge, Black Hamburgh, Black Prince, and very good bunches of Muscat of Alexandria; and Mr. Chapman, of Vauxhall, good samples of Sweetwater. A single bunch of Black Prince, weighing 2½ lbs., was furnished by Mr. Chapman, gr. to J. B. Glegg, Esq.; Mr. Davis, of Oak Hill, had a monstrous bunch of Black Hamburgh, weighing 3 lbs. 4 oz.; but it was disqualified by the judges, on account of their considering it to be, not the heaviest single bunch, but three distinct bunches issuing from one eye.

The best Peaches, by far, were a half-dozen Royal George from Ireland, produced by Mr. Robertson, gr. to the Marquis of Waterford, at Corraghmore. These were very large, handsomely grown, beautifully coloured, and notwithstanding the distance of transit, in excellent condition; Mr. Chapman, gr. to J. B. Glegg, Esq., had good specimens of Grosse Mignonne; and Mr. Vare, gr. to Gen. Lygon, Spring Hill, Oxon, fair fruit of Royal George and Bellegarde; Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, sent Late Admirable; and Mr. Gardiner, gr. to Sir G. Philips, Bart., Royal George, and Yellow Alberge. Fine looking Scarlet Nectarines were shown by Mr. Chapman, gr. to J. B. Glegg, Esq.; Elruges, by Mr. Foggo, and Brugnon Nectarines by Mr. Evans, gr. to Mrs. Newdigate, Nuneaton, Warwickshire.

Uvedale's St. Germain Pears, and Sturmer Pippin Apples of last year's growth, still in good condition, were communicated by Mr. Nottidge, of Streatham; Brown Turkey Figs by Mr. Foggo; the same kind of Fig by Mr. Chapman, gr. to J. B. Glegg, Esq.; and May Duke Cherries, from the Royal Gardens, Hampton Court, by Messrs. Jackson, of Kingston.

Strawberries.— Fine specimens of British Queen were exhibited by Mr. Busby, gr. to S. Crawley, Esq., Stockwood Park, Luton, and the whole of these, even the tips, frequently pale in this variety, were well coloured. The same sort was exhibited by Mr. Elliott, gr. to J. B. Boothby, Esq., and by Mr. Toy. The latter likewise contributed Keens' Seedling, as did also Mr. Monro, gr. to Mrs. Oddie, of Colney House, St. Alban's. Well-grown British Queen Strawberries in pots were produced by Mr. Elliott, Keens' Seedling by Mr. Monro, and the same variety by Mr. Toy.

Melons.—Several were exhibited, and, considering the season, they were generally well ripened. Mr. Monro showed (as the heaviest Melon) a fruit of his Egyptian Hybrid Green-fleshed, weighing 7 lbs. 8 oz.; and Mr. Gadd, of Betchworth Castle, a Canteloup weighing 5 lbs. 13 oz. The first prize for the best flavoured Melon was awarded to Mr. Fleming, for his Hybrid raised between the Hoosainee and Ispahan; and the second to Mr. Welding, gr. to Capt. Kennett, of Ham, for a Hybrid Green-fleshed. Other Melons consisted of a Beechwood, 6 lbs. 4 oz.; a Hybrid Green-fleshed, 3 lbs. 12 oz.; Snow's Green-fleshed, Hybrid Persian, Cuthill's Scarlet-fleshed, and Wood's Egyptian Green-fleshed.

Mr. Hamp, gr. to J. Thorne, Esq., sent a small cluster of fruit of the Musa Cavendishii, in the production of which he is very successful.

Royal Botanic, *June* 12.—The plants mentioned in the preceding report having been very generally reproduced at this show, we confine our observations entirely to the subjects which we did not remark at Chiswick. Messrs. Henderson, of Pine-apple-place, had a small plant of their charming Begonia cinnabarina; Messrs. Veitch, their evergreen shrub Escallonia macrantha, which is reported to be hardy, and Dipladenia urophylla, a rather pretty species, but wanting in brilliancy of colour. Mr. Ivison, gr. to the Duchess Dowager of Northumberland, sent Curcuma cordata, a somewhat scarce plant.

Mr. Falconer, gr. to A. Palmer, Esq., of Cheam, exhibited a group of tall Cacti, large, and well flowered. The sorts were Epiphyllum Jenkinsoni, and its large flowered variety, E. speciosum, Cereus speciosissimus and C. Mallesonii, and its rose-coloured variety.—Messrs. Lee, of Hammersmith, showed their dwarf Cereus called Leeanus, a beautiful kind, with four large semi-double orange scarlet flowers placed on its summit, one, as it were, at each corner of a square, and bending gracefully outwards.

Orchids.—Mr. Barnes, gr. to H. Hanbury, Esq., sent a collection consisting of Brassia Wrayæ, Oncidium altissimum, O. luridum guttatum, the Brassia-like O. phymatochilum, the large flowered Phalænopsis, Saccolabium guttatum and præmorsum, a very fine plant of the hardy Lady's Slipper (Cypripedium spectabile), Aerides Brookii, and the rosy variety of Epidendrum macrochilum. The same grower also had Barkeria melanocaulon.—Mr. Mylam, gr. to S. Rucker, Esq., sent a large and fine Aerides odoratum, hardly forward enough; Odontoglossum Lindleyanum, and Paphinia cristata. —Mr. Schröder had Coryanthes macrantha, with one flower open, and Vanda tricolor.—Messrs. Rollisson, Acineta Barkeri, with a fine spike of yellow flowers, and Coryanthes macrantha.

Stove and Greenhouse Plants.—Mr. Barnes, gr. to H. Hanbury, Esq., produced Tremandra verticillata, Erica Cavendishii, Boronia serrulata, Ixora coccinea, Azalea variegata, Æschynanthus Boschianus, Henderson's Pimelea, Franciscea acuminata, Dipladenia splendens, and D. crassinoda. D. crassinoda, a beautiful plant when well flowered, was pretty generally exhibited at this show. Another collection of 10 well grown plants was shown by Mr. Croxford, gr. to H. Barnes, Esq., of Stamford-hill. It consisted of Gompholobium versicolor, Ixora coccinea, Aphelexis macrantha purpurea and humilis, Stephanotis floribunda, Epacris miniata, very highly coloured; Phænocoma proliferum, the blue Leschenaultia, the white-flowered Vinca, and Allamanda cathartica.—Mr. Laybank, gr. to T. Maudslay, Esq., of Norwood, sent the best variety of Aphelexis sesamoides, Erica depressa and E. ventricosa alba, Hoya carnosa, the red-blossomed Leschenaultia, Boronia serrulata, a Chorozema, a Dillwynia, and an Azalea.—Mr. Green had an excellent specimen of Mr. Fortune's Gardenia, but its beauty was unfortunately over. It had had a dozen blossoms on it at one time.—Mr. Carson sent Mussænda frondosa in excellent condition, its large white bracts contrasting strikingly with the broad green leaves and small yellow flowers.—In Mrs. Lawrence's collection were Gompholobium splendens, so trained as to form a charming little bush of the clearest yellow; and a capitally bloomed plant of the Fuchsia-like Abelia floribunda. The latter was at least 3 feet high and as much through.

Roses were in good condition. Messrs. Lane had a most beautiful specimen of the comparatively new Rose Souvenir d'un Ami—white, tinged in the centre with salmon, large and handsome. Their "Queen," too, was the admiration of everyone. The other kinds were Chénédolé, Comtesse Molé, Great

Western, Madame Plantier, Paul Perras, Souvenir de la Malmaison, Fabvier, Miellez, Miss Glegg, and Devoniensis. Mr. Francis had Las Cases, Belle de St. Cyr, Pauline Plantier, Fulgens, Duc de Cazes, Mrs. Elliott, Madam Laffay, William Jesse, Chénédolé, and Coupe d'Hebe. Among Messrs. Paul's were Baronne Prevost, Charles Duval, Mrs. Bosanquet, finely bloomed, Nephetos, Augustine Mouchelet, and others. In Mr. Terry's group was a fine example of La Dauphine. Yellows consisted of Harrisonii, Persian, Queen Victoria, Smith's Vicomtesse de Cazes, flavescens, La Pactole, and Pauline Plantier. Mr. Standish had a new Rose in the way of Safranot.

Some Fuchsias were shown, and we remarked an interesting collection of Ranunculuses from Mr. C. Tyso, of Wallingford. The following are a few of the leading sorts which the collection contained: Berinus, Dr. Channing, Kilgour's Queen, Apollo (dark), Niobe, Robert Burns, Lambton, Gomer, Amasis, Enchanter, and Tyso's new seedlings—Exhibitor, Elegance, Captivator, Festus, and Tysonius.

Fruit was produced at this show, but with one or perhaps two exceptions it was not remarkable either for quality or quantity. Of tropical fruits Mr. Ivison sent examples of Gamboge, Star Apple, Loquat, ripe and unripe Vanilla, and Diospyros Sapota.

Miscellaneous.

Mr. Bateman's Orchids.—The following list of some of the prices obtained at the late sale of these plants will probably interest a good many of our readers:—Angræcum eburneum, a fine specimen, fetched 19*l.* 19*s.*; A. caudatum, two plants in one, each coming into flower, 18*l.* 18*s.*; Aerides affine, fine specimen, 14*l.* 14*s.*; A. odoratum, ditto; A. maculosum, 8*l.* 18*s.* 6*d.*; A. quinquevulnera, 6*l.* 15*s.*; Vanda suavis, 17*l.* 17*s.*; V. Batemanni, 5*l.*; Cattleya labiata, 11*l.* 11*s.*; C. Aclandiæ, two plants in one, 11*l.* 11*s.*; C. Walkeriana, 7*l.* 17*s.* 6*d.*; C. maxima, 6*l.* 6*s.*; Cœlogyne cristata, 7*l.* 7*s.*; Coryanthes Fieldingii, 7*l.* 7*s.*; Saccolabium guttatum, fine plant, 12*l.* 1*s.* 6*d.*; S. ampullaceum, 10*l.* 10*s.*; Dendrobium densiflorum, fine plant, 11*l.* 6*s.*; D. Dalhousieanum, 5*l.* 10*s.*; D. Devonianum, 4*l.*; D. cærulescens, 4*l.* 5*s.*; D. moniliforme, 4*l.* 10*s.*; D. Veitchianum (Java), 6*l.* 6*s.*; D. palpebræ (Moulmein), 4*l.* 5*s.*; D. nobile, 3*l.* 5*s.*; D. transparens, 4*l.* 5*s.*; Epidendrum phœniceum, 4*l.* 5*s.*; Lælia Perrinii, fine plant, 11*l.*; L. acuminata, 5*l.*; L. crispa (Cattleya crispa), 4*l.* 10*s.*; L. cinnabarina, 3*l.* 15*s.*; Miltonia candida grandiflora, 3*l.* 10*s.*; M. cuneata, 4*l.* 5*s.*; M. spectabilis, 4*l.*; variety of ditto, "with whole coloured purple flowers," 5*l.* 15*s.*; Oncidium Martianum, 4*l.*; O. pelicanum, 5*l.* 10*s.*; Phalænopsis amabilis, 4*l.* 5*s.*; P. grandiflora, 3*l.* 5*s.*; P. rosea, 1*l.* 3*s.*; Ansellia africana, 3*l.* 12*s.* 6*d.*; Anguloa Ruckeri, 3*l.* 3*s.*; A. Clowesii, 2*l.* 15*s.*; Barkeria Skinneri, 2*l.* 15*s.*; Bolbophyllum Lobbii (Java), 2*l.* 3*s.*; and Odontoglossum citrosmum, 3*l.* 10*s.* Other lots, of which there were in all 202, fetched from 10*s.* to 2*l.* 10*s.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Particular attention should at all times be paid to the preparation of winter-flowering plants, and first and foremost of these is the Azalea. Those plants which were forced early, and have completed their growth, should be gradually exposed to a cooler temperature; and, when their blossom buds are perfected, they should be placed out in an open airy situation. As soon as the season is turned, those which have filled their pots with roots should be favoured with a slight shift, which will be found particularly serviceable to those varieties of a half-deciduous habit, like A. indica alba; for the consequent activity of the roots tends very considerably to preserve their foliage under cool treatment in autumn, besides giving additional substance and stability to the flowers. As habit becomes a second nature, these earliest forced plants of last season will, of course, come in for the same purpose this year. Euphorbia, Eranthemum, Justicia, Vinca, Begonia, Gesnera, Gardenia, Franciscea, Jasminum, Aphelandra, Poinsettia, Torenia, Cactus truncatus, &c., are useful for autumn and winter flowering. The existing plants of this kind should continue to receive every encouragement in the way of rich soil, liberal pot room, and an adequate amount of heat and moisture, that they may form handsome, healthy specimens. It is well also to propagate some young plants of many of these kinds, as they will be useful for flowering in small pots this season, and will be grown on to make the larger specimens for next. All free-growing plants should be encouraged with weak manure water once or twice a week, according to the progress which the roots have made towards the sides of the pots.

FLOWER GARDEN AND SHRUBBERIES.

Hyacinths, Tulips, and other bulbs, whose foliage is now fully matured, should be taken up, dried, cleaned, and stored in an airy room till autumn. It is a common practice to throw away the old bulbs which have been forced, or to stick them into some out-of-the-way border, and take no further notice of them; but they are well worthy of a greater share of attention. If, after being well ripened, they are taken out of the soil, carefully stored in a dry room during their season of rest, and in autumn replanted in beds of light rich soil, a healthy stock will be established in a few years, and from these the largest and soundest bulbs can annually be selected for forcing. Of the remainder, those which are large enough to flower at all may be planted in the flower garden, where they are highly ornamental during the spring months, and are at the same time preparing themselves for forcing in future years. Therefore let all the old bulbs you have in or out of the ground be taken care of till the planting season arrives. Hollyhocks, Dahlias, Delphiniums, Phloxes, and other herbaceous plants, must be neatly tied to good strong stakes; but this is very different to bundling them up in such a manner as to deprive them of light and air. The object of tying is to support the weight of the plants; but, at the same time, light and air should be freely admitted amongst the branches. In tying the Hollyhock, it is a common practice to bind up six or eight shoots to one stake, in which case the flowers are almost entirely concealed by the leaves. The proper way is to select a few of the strongest shoots of each plant, and tie them to separate stakes, placed sufficiently distant to admit light and air; so treated, the flowers display themselves to advantage, and their appearance is truly noble.

HARDY FRUIT GARDEN.

The shoots which are retained on wall fruit trees require attention in nailing or tying, as the fruitfulness of the trees very much depends upon the shoots not being allowed to crowd or interfere one with another; and if their ornamental appearance, in an artistical point of view, is any object, the shoots should be laid in at proper angles while they are young. Continue pinching the points of Gooseberry and Currant shoots, and especially where they are blighted; it is a very quick way of destroying myriads of insects, while at the same time it forms a necessary part of the cultivation of the plant. Continue the exterminating process wherever insects make their appearance, as well upon the smaller bush fruits as upon the wall trees. The garden engine should be at work every night and morning upon these and the walls. Early Cherries particularly require this, as the black fly is making its appearance, and if not destroyed in time will soil the fruit as well as injure the leaves. Where common tiles have been adopted as a means of keeping Strawberry fruit clean, they should occasionally be turned up, by which a congregation of snails, beetles, and other injurious insects, will be exposed to view, and may be easily destroyed. The facility with which this may be done gives the tiles a great advantage over Grass or straw, as the latter materials harbour insects without affording the means of getting at them.

KITCHEN GARDEN.

No crops after this time should be sown so thickly as to require much thinning, for in hot dry weather considerable injury is thereby done to the plants which are retained. Plants sown now for future transplanting should be sown much thinner than would have been thought necessary a month or six weeks back; this is to allow them a longer period to grow before they will need to be removed, and in order that they may then be carefully lifted with large balls of earth. Make regular sowings of Turnips and Spinach, and of Lettuces and other salads, once in two or three weeks; sow a bed of Carrots, and of Onions, for using in a young state; and as small roots of Beet are generally preferred, a late crop of them should now be sown. A sowing should be made of the Vanack, or early dwarf Sugar-loaf Cabbage, for late summer and autumn use; and of Knight's Protecting Broccoli, for late spring use. Cardoons should now be transplanted from the frames or pots, choosing a moist or dull day for the purpose, and watering them afterwards in hot weather till they are thoroughly established. Let the leaves of Garlic be tied in knots, to check the production of flowers, and assist thereby the development of the roots.

State of the Weather near London, for the week ending June 13, 1850, as observed at the Horticultural Garden, Chiswick.

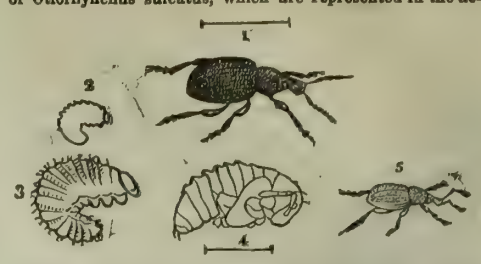
The highest temperature during the above period occurred on the 19th and 22d, 1846—therm. 93 deg.; and the lowest on 16th, 1829, and 22d, 1830—therm. 39 deg.

Notices to Correspondents.

Asparagus: *Anon.* You may apply, in February or March, as much as 20 lbs. of salt to a bed 33 feet in length by 4 feet in width.‡



Black Beetles: *G C.* If your floor cannot be pierced as we formerly recommended, then you had better procure one of *the capital traps* sold by Marchant, 253, Regent's Circus, Oxford-street; or Jackson, 19, Threadneedle-street.

Books: *Alpha.* Baxter's "British Flowering Plants" is very useful; but it only contains one species of each genus. Moore on Ferns is cheap, Newman's is more costly, Francis's, of which there is a new edition just out, is between the two; either will probably serve your turn.—*J Poole.* You must study—1, "School Botany;" 2, "Elements of Botany," in which you will find all the information you seek. You have put the cart before the horse.

Garden Memoranda: *Helmsley.* We cannot insert statements from anonymous correspondents or interested parties.

Guano: *A Subscriber.* If the public will support us, merely by adopting our advice, or by opening their eyes a little wider than usual, we shall break up the nest of thieves, numerous and strong as they fancy themselves. But the men of Liverpool should do there what we do in London. It is not quite fair to ask a metropolitan Paper to perform purely local duty. There is plenty to do at Liverpool and every other principal port.

Insects: *W F.* You will find an account with figure of the Otiorhynchus tenebricosus in its perfect state in the *Gard. Chron.*, p. 316, 1842. Its transformations are similar to those of Otiorhynchus sulcatus, which are represented in the accompanying woodcut. 1, the perfect insect somewhat magnified; 2, its larva or grub of the natural size; 3, ditto magnified; 4, the pupa magnified; 5, Otiorhynchus picipes. The larvæ of all these species feed at the roots of plants, and consequently the more perfect insects you now destroy the less will your Filbert plantation suffer by-and-bye. *W.*—*S H H W.* The caterpillars sent, which have done so much damage to your Ranunculus bed, are the larvæ of the common Daddy-long-legs (Tipula oleracea). Examine the roots of the plants carefully as soon as they appear to flag, and destroy all the flies as soon as they appear in the winged state, which will now be in a very short time. *W.*—*E T C.* Why did you not send specimens of the Smother fly? We can only guess what it is—Psylla Fagi, Linn. If repeated syringing fail, try whether smartly shaking the trees, placing under them large sheets of paper covered with pitch, will not lessen the evil. *W.*—*G B.* Earwigs may be trapped by placing a little dry moss in the bottom of small garden pots, and inverting the latter on stakes a short distance from the ground. Withered Hemlock or Bean stalks also make excellent traps for them. These should be examined daily, and the insects in them destroyed ‡—*T D H.* We cannot guess what is the species of insect found at the root of your Orchids without seeing a specimen. If it be a Podura, we should scarcely think it would injure healthy plants. Please to send us some specimens for identification. *W.*—*T S P.* The insects sent from Pembroke dockyard, where they are destroying the Oak stuff, are the larvæ of the destructive Lymexylon navale (killed by being sent loose). The plan suggested by Linnæus for their destruction was to sink the timber in water, at the time the perfect insects make their appearance, by which they are destroyed. We should be very much obliged to you for a piece of the wood containing some of the insects sent up uninjured, in order to trace their transformations. *W.*—*J W.* The beetles infesting the bacon are the common bacon beetle (Dermestes lardarius), and the small insects sent with them are their young. In so bad a case as this the sooner the bacon is eaten the better; plunging it into hot water will kill the insects. *W.*

Lilium: *E H.* Cold, acting upon a rank watery growth, has probably done the mischief.

Names of Plants: *Erzeroum.* 97, Ribes alpinum.—*P B.* 1, Epidendrum tripterum; 2, a variety of Epidendrum aromaticum; 3, Cymbidium chloranthum; 4, Phaius bicolor. We must decline answering your inquiries in future, if you *will* not state where the plants come from. Refusing this, surely very reasonable, information, quadruples our trouble.—*An Old Subscriber.* No; it is the Ivy-leaved Pelargonium.—*Rougham.* Smilacina racemosa.—*G P H.* Some Hypnum; Ervum hirsutum and Festuca ovina.—*Ravenswood.* Collomia lateritia.—*R Cox.* Anagyris indica.

Peas: *A Market Gardener.* The "Early May" Pea is not invariably single blossomed. Whether it, or any other variety, may or may not produce only single blossoms, depends upon circumstances over which a seedsman has no control, and therefore he cannot be liable to an action, we should suppose, if what are called "single blossomed" should occasionally produce double blossoms; but if he warrant the contrary, of course he must abide by the consequences.‖

Pines: *B A L.* No Conifers like chalk. If you have any near you which form an exception, then you may form an opinion by comparing the habits of those you want with what you have.

Pits: *Sub.* The drip will be carried down, if the back is 2 feet higher than the front on a width of 8 feet; or, in other words, the sashes may be made to slope 1 foot in 4.‡

Potatoes: *John Lawson.* Your plant has been killed by excess of water. All plants are injured by excess of water; the Potato more readily than many. The "disease" is not indicated by your roots, &c., rotting. They could not do otherwise.

Slugs: *Strawberries.* Slices of Swede Turnip make good decoys for slugs; or ducks will eat them, and lime-water applied night and morning, when slugs are feeding, will soon rid you of them; but perhaps the most effectual remedy is pretty strong gas water applied at feeding time, provided you can use it without its touching your plants.‡

Misc: *F Z.* We must refer you to advertisements; we cannot undertake to do the business of advertisers.—*Ravenswood.* Glycine sinensis may be propagated by cuttings of the root, struck in heat, or by layers. A Pomegranate is certain to flower against a south wall, as soon as it is old enough, provided the border is well drained. The Laburnum is mildewed; you cannot prevent it now; it is probably of no great consequence. The common English Buckbean is not sold, but grows everywhere in marshy places. You had better try the tank water experimentally before you use it on a serious scale. We have no experience with it.—*W M, Ely.* You can have the Numbers; the price is 2*s.* 6*d.*—*W A A Rothwell.* We do not know what Lilly band is.

SEEDLING FLOWERS.

Calceolarias: *J R R.* Crushed to pieces in coming through the post.*—*W C.* So shrivelled up that no opinion of their merits could be formed. Can you favour us with fresh blooms.*—*J G.* Prettily marked. All inferior to kinds already in cultivation. The best are 9, 13, 18, 26, 27, and 30.*—*Kilnwick.* Clear yellow, mottled with rich brown; size and substance good, but hardly round enough.*—*Anon.* Numbers all detached when received, therefore we cannot distinguish them. They are all more or less deficient in shape; of one of them, however—the largest—we should like to see better specimens. The white ground variety is striking; but it is much too small, and otherwise defective.*

Honeysuckle: *T B.* Your seedling does not appear to be any improvement on the Scarlet Trumpet.*

Pansies: *Y Y.* 38, white ground, top petals dark purple, lower petals margined with the same colour, good eye, which joins the margin—a great defect. 4, purple, with a white ground; worthless as a show flower. 65, white ground, top petals rosy purple, lower petals margined with the same colour; large, but thin and rough. 61, rich dark mulberry self; a promising flower. 2, rich yellow ground, top petals dark maroon, lower petals margined with the same colour, eye good; a full sized and fine flower.*

Scarlet Pelargonium: *W Turner.* Your seedling had fallen to pieces before it reached us. We can therefore only speak of its colour, which is brilliant.*

TURNIP SEEDS.

DUNCAN HAIRS having personally superintended the selection and growth of the Turnip Seed he offers, can with confidence recommend them as genuine. Likewise, AGRICULTURAL SEEDS of every description, of first-rate quality and low in price. Catalogues with prices free.

Garden Tools, Nets, and every article connected with the trade wholesale and retail.

Seedsman and Florist, 109, St. Martin's-lane, Charing-cross.

AGRICULTURAL DRAINING: THE DERBY LEVEL.—A Very Superior Draining Level, of great simplicity, price 3*l.* 5*s.*, to be had of the Maker, Mr. JOHN DAVIS, Optician, Derby. The above is securely packed and sent to any part of the empire.

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8*s.*, 15*s.*, and 21*s.*, casks inclusive.

PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence: not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2*s.*; rich brown, 2*s.* 9*d.*; greens and light colours 4*s.* per gallon.

G. BELL and Co., 2, Wellington-street, Goswell-street, London.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10	0	0
Clover Manure, do.	11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works Greenwich.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

SOUTH WALES RAILWAY.—NOTICE is hereby given, that this Railway will be opened for Passenger Traffic on the 19th of June, 1850. Trains will start as under:

	A.M.	A.M.	P.M.	P.M.		A.M.	P.M.
Swansea—Week Days	7.0	10.30	2.0	6.0	Sunday	7.0	6.0
Chepstow do.	8.0	12.0	4.30	7.0	do.	7.0	6.0

Calling at Intermediate Stations as per Train Bills, which will be procurable at the Stations on the Railway on and after the 18th June. By order of the Directors,

FREDERICK G. SAUNDERS, Sec.

WANTED, A GELDING, 15 hands high, not exceeding six years of age, powerful, with good action, and quiet to ride or drive. Any breeder or farmer having a horse of the above description, well broke in and perfectly sound, may hear of a purchaser by stating full particulars, with price, to T. M, 12, Star-street, Paddington, London.

N.B.—No dealer will be attended to.

GARDEN NETS, FISHING NETS, SHEEP NETS.—New Garden Net, made by machinery, 1½*d.* per yard; Tanned Fishing Nets, ¾*d.* per yard; 3-strand Thread Nets, to protect fruit from wasps and flies, 6*d.* per square yard—this article has been approved by the Horticultural Society, dipped in preparation to prevent decay. All kind of Seine, Trammel, Casting, Drag, Hoop, and other Nets cheap. Strong Sheep Nets of New Zealand Cord or Cocoa-nut Fibre, 4½*d.* per yard, 4 feet high.—R. RICHARDSON, 21, Tonbridge-place, New-road, London. N. B. Maker of the Patent Rabbit-proof Wire Fencing, 6¾*d.* per square yard.

The Agricultural Gazette.

SATURDAY, JUNE 15, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June 19—Agricultural Society of England.
THURSDAY, — 20—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 26—Agricultural Society of England.
THURSDAY, — 27—Agricultural Imp. Society of Ireland.

A MOVEMENT has recently taken place in several influential quarters to obtain an alteration of THE SCOTCH LAW OF HYPOTHEC so far as regards the landlord's power to compel a repayment by a purchaser for grain bought by sample in open market from a tenant against whom a right of hypothec has been executed by his landlord for arrear of rent.

The English Law of Distress, in such cases, gives the landlord a right over the tenant's property only as long as it remains on the farm, and ceases when sold to, and in the possession of a *bona fide* purchaser; but if purchased by a person in collusion with the seller, with a fraudulent intention, then the right of recovery still remains with the landlord. In Scotland, on the contrary, if a tenant be placed under the bar of hypothec by his landlord for arrears of rent, no corn-dealer, miller, or any other person, can purchase grain from him by sample or otherwise, even in open market, without being subjected to the liability either of returning the grain or paying the landlord for it, even although he has already paid the price to the person from whom the corn was purchased. Farther, this law gives the landlord a *preferable* claim over his tenant's property, to the exclusion of all *common* creditors—the Crown, superiors, farm-servants, and creditors for funeral expenses, alone being excepted.

The obvious operation of such a law is to exclude the business of farming from participating in the advantages of ordinary mercantile transactions. The tenant can neither purchase goods nor borrow money upon the same conditions as the manufacturer or merchant, because of the existence of a law which concedes the privilege to the landlord of stepping in, whenever an arrear of rent occurs, and taking possession of the whole property on the defaulter's farm, and retaining it, or selling it for his own behoof, and in full payment of those arrears to which the hypothec extends. Agriculture thus becomes severed and isolated from other branches of industry; it and those engaged in it are helotised, and deprived of the unfettered freedom which characterises and has made glorious the commerce of Great Britain.

The ordinary term of taking possession of a farm in Scotland, in localities where the practice of steelbow does not exist, is at Martinmas (11th Nov). The tenant occupies the farm for 18 or, at least, 15 months from that date before being called upon to pay any rent. Thus a person entering a farm at Martinmas, 1850, would not require to pay rent until Candlemas or Whitsuntide, 1852, and then only a portion of it. Rents in Scotland are either paid half-yearly, tertially, or quarterly, but in the last year of the lease the whole rent must be paid before the tenant can sell off, or remove his crop and stock; or failing this, proper security must be granted for its being paid. From the nature of this engagement it seems not unreasonable for the landlord to demand the most unexceptionable security from a tenant for the payment of his rent; but unfortunately out of this long-credit system has arisen a special law which excludes all ordinary creditors from participating in a share of the effects of a bankrupt tenant until the landlord's claim is settled in full. Such a law as that of hypothec is probably well adapted to the condition of bondsmen—for whom it was originally concocted—but in a free and enlightened age it is a blot on the statute-book. A law claiming, for the lord of the soil, a lordship also over the bodies and chattels of his vassals might correspond, in some degree, to the condition of the tenantry in the times of the earlier Stuarts, but now as there is liberty to the person and freedom of thought, so should agricultural property be disenthralled from a law which is so emphatically feudal in its every feature. The *Faith* which merchants and commercial men repose in each other's integrity, and which has infused a spirit of honour and truth into the transactions of business life in Britain, seems to have neither part nor lot in the bargain between the owner and occupier of the soil, wherever a law exists to give one creditor an exclusive preference over all others.

But what, we may inquire, have been the practical effects of this system on the business of farming in Scotland, a country where the law of hypothec has existed so long, and is still so impregnably intrenched behind the accumulated ramparts of custom, and existing engagements, combined with the inability of the farmers to free themselves from its operation, and the unwillingness of their landlords to forego the privileges it confers? Its first effect undoubtedly has been to induce farmers to occupy land with comparatively small capital, in consequence of the long-credit system, which gives them the privilege of sowing, reaping, and selling the first crop of a new lease before any rent is asked. The obvious effect of this privilege is to encourage competition for land among individuals whose capital in nine cases out of ten is greatly inadequate to stock and improve it properly. This competition so fostered has not unfrequently presented the anomalous fact of land rising in price, while the value of corn, cattle, &c., has been long and rapidly diminishing. The law of hypothec has therefore contributed greatly to the existence of two evils—the first an unnatural competition for land, and secondly an occupancy with a capital generally much below what is requisite to extensive and permanent improvements.

The ultimate effect of removing the law of hypothec entirely from the statute book of Scotland, and substituting in its stead the more rational and equitable law of distress, as in England, would prove highly beneficial to the interests of the farmers themselves, by restricting the competition for land to that point at which the capital employed must necessarily correspond to the requirements of the particular subjects upon which it is to be expended. Were this law abolished a landlord would reasonably require an instalment of rent at the end of the first six months' occupancy, instead of at the end of 15 or 18 months, as at present, and consequently the capital required in such a case must not only be sufficient to stock the land with cattle, horses, implements, manures, seed corn, &c., but also leave a surplus to pay a half-year's rent. The law of distress would, under such circumstances, be perfectly competent to protect the landlord against any default on the part of the tenant.

As matters are at present, a tenant, with a 15 or 18 months' credit from his landlord who has a preferable claim over all common creditors to his tenant's effects, is placed out of the pale of an unfettered trader. In proportion to the amount of credit afforded by the landlord, and the extent of preferable claims guaranteed to him by law, so must the commercial status of the tenant be lowered in the estimation of all with whom he may have dealings. The banker freely lends money to the merchant or manufacturer upon very ordinary security, because he knows that, happen what may, he has an equal right with other creditors to the effects of the individual he has trusted. With a farmer this can never be the case as long as the law assigns to the landlord the "lion's share" of his effects in the event of a sequestration being taken out against him. The manufacturer may, and often does, surmount a bankruptcy, and future prosperity sometimes enables him to clear off old scores, but a farmer once a bankrupt in Scotland, it has been more alliteratively than feelingly said, has no resource but a "turnpike or a tavern." The case of an enterprising tenant who has sailed too near the wind and run himself aground in consequence of his very efforts to obtain greater scope for improvement, is a particularly hard one—all he needs being time to extricate himself from his present difficulties; his capital is not lost, it is only invested in his farm and will reproduce itself sooner or later, either in part, in whole, or with increase according to the skill displayed in laying out, but he falls on "evil times"—a bad harvest, or a fall in the price of farm produce occurs, his outgoings exceed his income, and he finds himself by and bye not in a position to meet his landlord's agent at rent day. He cannot

go to a capitalist or banker to ask assistance, because the landlord's right of hypothec stands in the way; and finally he is thrown upon the landlord's mercy, who may, under such circumstances, dictate his own terms. This is by no means a fanciful picture, it is a stern reality of every day occurrence, and this year more frequent than ever. Is the landlord to blame? No, certainly not for adopting a course which the law recognizes; but, assuredly yes, if the tenant's defalcation can be satisfactorily proved to be the result of improvements, the benefits of which are still unrealised, the justice either of ejecting him for arrear of rent, or the exaction of usurious interest on the balance due may fairly be questioned. If an ejectment be made, the landlord retains property which the *civil* law recognises as his, but which the *moral* law can never sanction as such. Let landlords concede this point—remuneration for unrealised improvements—and the law of hypothec bad as it is both in principle and practice, would press much more lightly on the tenant, while at the same time his status in the estimation of the money dealer would be materially changed to the better.

Lord BROUGHAM'S bill for altering the law of hypothec only goes the length of depriving the landlord of the power to reclaim farm produce sold in open market to a *bonâ fide* purchaser. The terms of the bill are so moderate and reasonable that even the most stringent sticklers for maintaining the other provisions of the law of hypothec can scarcely object to it, or refuse concurrence in its object, which is virtually to acknowledge the integrity of all public sales of farm produce, and to protect the buyer against the liability of paying his purchases twice over—a state of matters most revolting to the spirit of British love of fair play and common sense. *J.*

ESSEX FARMING.

THOUGH the county consists of various soils, the system of agriculture followed on the heavy and lighter lands respectively is pretty uniform. Corn farming is the distinguishing feature of the district, and long fallows and diligent hoeing keep the land very clean and free from weeds. The four-course system is generally adopted. Barley is sometimes sown after Wheat, when the land is in a rich state, and excellent crops are got by this management. To illustrate the mode of cultivation we shall take a farm of 200 acres near the Roothings—a clay marl district, some miles west of Chelmsford.

The soil is on a gentle slope, by no means a strong clay, mixed with small stones and chalk, the fields large, and not encumbered with wood or wide hedgerows. The farm buildings are abundantly commodious for the stock at present kept by the farmer. They are erected by the landlord and kept in repair by the tenant, who farms on a lease of 14 years. Where the tenant thinks it necessary, he drains the land at his own expense, making the drains 22 inches deep and about 32 feet apart, and filling them with haulm (stubble). The subsoil being a stiff clay forms an arch over the haulm, which remains open after the stubble itself has rotted away. Such drains are supposed to last a 14 years' lease, and are of much benefit to the land. They are made in the division that is to be fallowed. The fallow is ploughed and harrowed as often during the summer as the farmer thinks it necessary, never less than five or six, and occasionally as often as eight times. A portion of it is burnt annually, and that which is in the most foul condition is chosen for this operation; indeed, it is found advantageous to sow Rye-grass occasionally with the preceding crop, in order to get plenty of roots and organic matter to assist in the combustion of the clay. Early in May the land to be burnt is ploughed very light, well dragged about, and then gathered into heaps, a quantity of haulm having been previously placed in the centre. This is set on fire, and the earth packed round it, care being taken not to let the fire burn through without putting on more earth, while too heavy a quantity at a time must also be guarded against, as that would extinguish the fire. The fire is kept burning slowly night and day till the whole is reduced to ashes. These are spread over the ground at the rate of 100 or 120 yards an acre, and at a cost in labour of from 20*s.* to 25*s.* The effects of the burning are, that after it the land dries sooner, can be worked and sown earlier in spring, and that both the quantity and quality of crops are improved, especially so of Barley and Clover. Experienced farmers say that the oftener it is burnt the more the soil is improved, and in many cases the process is repeated every sixth year. It is most necessary that the land should be well under-drained before being burnt. Four or five acres of the division in fallow are sown with Swedes and Mangold Wurzel, well manured. Half of this division is sown in autumn with Wheat (6 pecks an acre), the other half early in spring with Barley (4 bushels an acre); the Barley taking the place of the Wheat in the next rotation. The Barley land is sown with 14 lbs. of red Clover to the acre, the greater portion of which is fed off, and a small portion mown for hay. The Wheat is followed by Beans, the land being dunged and the seed dibbled in. The Beans are not horse-hoed, but kept remarkably clean with the hand-hoe. They are hand-hoed by men at a cost of 3*s.* an acre for each hoeing, and that is repeated five times in a season if necessary, but never less than three times. The Clover and Beans are both followed by Wheat. In the 200 acres there are thus annually—45 acres in long fallow, 5 acres in roots, 75 in Wheat, 25 in Barley, 25 in Clover, 25 in Beans. The haulm already mentioned is the stubble which is mown and stacked up in long heaps after harvest. The stubble for this purpose is left about 2 feet long, the farmers arguing that the less bulky he can make his crop in harvest, when wages are high, the better. In this way a much greater number of bushels of grain is carried home in the waggon, stored in the rickyard, and finally much more easily passed through the threshing-machine. When the busy harvest period is over, the haulm or stubble is then cut with the scythe and carried to the field where the operations of burning and draining are to be effected next season. Under this management the crops reaped average 28 bushels of Wheat, 40 of Barley, and 32 bushels of Beans. The whole stock kept on this 200-acre farm is 80 sheep in summer, five or six cows, and 12 or 14 straw-yard cattle. Eight work horses to do the horse work; three in a plough in winter, two in summer. The rent is 20*s.* an acre; tithe and rent charge, 6*s.*; poor-rate, &c., 4*s.*; or about 30*s.* an acre altogether. There is no hay or straw sold, and about a ton of guano is annually bought.

On the farm of Mr. W. Hutley, of Witham, we found a much more enriching system adopted. By heavy applications of purchased manures, and the conversion of all his straw into excellent dung—by feeding his roots in conjunction with cake and corn—he keeps his land in a high state of fertility.

His lighter land he drains at his own cost, with 2-inch pipes, 32 inches deep, and 32 feet apart. Heavy land, he thinks, with many others in this county, receives no benefit from tile drainage. His fences are kept very narrow, and the land ploughed close into their roots. On land which is not too heavy for roots he thinks it advisable to have a long fallow, perhaps once in eight years, on the principle "that soil which is generous to him should be treated gratefully in return." A crop of Tares preceding a fallow "draws" the land, in his opinion, to the extent of 20 bushels of Wheat an acre; that is, he would expect 40 bushels an acre without a crop of Tares, and only 20 bushels when a crop of Tares had been previously taken. He manures highly for his Mangold Wurzel, the yellow globe variety, using 30 loads of dung, 4 cwt. of Rape dust, and 2 cwt. of guano per acre. The result is a yield of 35 tons an acre over his whole crop, and that he is now selling at 15*s.* per ton on the spot, to be sent to London, which is equal to 26*l.* 5*s.* an acre. The green crop thus appears to be much more remunerative than the corn crop, when it can be disposed of on such advantageous terms; 40 bushels of Wheat per acre, and 56 bushels of Barley are reckoned equivalent crops when the soil is in equally favourable condition. Wheat is sown broadcast, after Clover and Beans, at the rate of 6 pecks an acre; Barley is drilled in after a long fallow in spring. Mr Hutley's system is to have one-fourth of his farm in Wheat, one-fourth in fallow and roots, one-fourth in Barley, and one-fourth in Clover, Trefoil, and Beans. By changing the latter every rotation, red Clover is repeated only once in 12 years, and a plant seldom or never fails. In the management of stock Mr. Hutley's practice is to turn his horses into a large open yard, in front of the stable, after they have had their bait of corn, and here they remain out night and day, when not in the yoke, summer and winter. He is never troubled with grease or other ailments among his horses. His sheep are fed partly in the field and partly in the yards; the couples are fed in the field on roots; 300 tegs are kept in two adjoining yards, 150 in each—one provided with shelter sheds, the other quite open. Both yards are well littered with straw, and in these the sheep have been kept during the winter. They receive roots, cut chaff, and 200 lbs. of oilcake daily, among the 300. They are now being sold out at an increased price, between carcase and wool, of 18*s.* to 20*s.* for 30 weeks' keep; thus leaving the cost of the cake (about 9*s.* a head), a large quantity of rich manure, and 4*d* a week for the roots and chaff. The feeding of pigs is carried on to a great extent by Mr. Hutley. He breeds none, but buys pigs at about 18*s.* and feeds them five weeks, when they are ready for the London market. They are fed on meal of different kinds, and sometimes on boiled Indian Corn. The difference between the buying and selling prices of the pig stock for one year has reached more than 2000*l.*, and seldom falls below 1200*l.* or 1500*l.* As this sum goes to pay for the corn consumed by the pigs, it shows how much Mr. Hutley is adding every year to the fertility of his farms. Oxen are fed on meal and chaff; few are kept, as they are not, with this management, a paying stock. Mr. Hutley attributes his success in farming to a liberal application of capital to the land, by drainage, chalking, artificial manures, and, above all, by keeping a large stock and employing sufficient labour. To do this he has been encouraged by a moderate rent, and entire confidence in his landlord.

At Tiptree-hall we examined the well-known and much-discussed farming operations of Mr. Mechi. The regularity and luxuriant appearance of the Wheat crops on the fields next the public road led us to anticipate an instructive visit, and we were not disappointed. It is of course quite unnecessary to enter into any history of the farm, as Mr. Mechi himself has already made that public. We shall, therefore, confine ourselves to a short description of some interesting matters of detail:

The farm is 170 acres in extent, principally a strong soil, with a very impervious clay subsoil. It adjoins Tiptree-heath, which is naturally very barren. By drainage, ample manuring, and liberal expenditure, the whole farm is kept in constant tillage; one-half of it every year under Wheat, the other half in Clover, Italian Rye grass, Tares, and roots. The Wheat is drilled in stetches, about 7 feet wide; it is twice horse-hoed; Beans, Peas, and Tares are also sown by the drill. Red Clover is sown on the same land once in eight years, and never misses a plant, 12 lbs. of seed being allowed to the acre. The Italian Rye-grass, though thin on the ground, is the most forward spring feed we have seen this season. Having walked over every field on Mr. Mechi's farm, we have no hesitation in saying that, for clean cultivation and healthy appearance of Wheat and other crops, it is equal to any, and superior to most, farms we have met with in this county. In the management and accommodation for stock Mr. Mechi is yet experimenting. The stock always kept on the farm are 150 sheep, 200 pigs young and old, 24 fatting bullocks and cows. Besides roots, 10 sacks of meal are used daily in feeding them; 700 to 1000 quarters of corn are bought annually for this purpose. All the animals are kept on boards, to economise the straw, and, with the exception of some of the pigs, they looked clean and comfortable. Mr. Mechi considers it proved that pork at 6*d.* per lb. will pay for Barley at 36*s.* a quarter; and at 4*d.* per lb., for Barley at 24*s.*, besides the manure. Two bullocks are placed in each box, 10 square feet of space being allowed to each. The boards on which they stand are 3 inches broad, with 2-inch intervals. For calves, 1½-inch intervals, and for sheep 1¼, are found best. One man feeds 200 pigs, mixing and carrying them food. They are fed thrice a day. A 6-horse power steam-engine is employed in threshing the crop, cutting chaff, grinding meal, bruising Linseed, hoisting sacks, &c. In short, no expenditure is spared by Mr. Mechi; and whether it has, on the whole, been profitable or not, there can be no doubt whatever that his example has in many points been instructive to the agricultural community.

From Colchester eastwards towards the sea stretches a tract of well-farmed land. We may especially notice that held by the Messrs. Ward, of Great Bentley, whose cleanly cultivated fields and admirable stock of every description are sure to claim the attention of the observant traveller. From Colchester, in the opposite direction, and nearly on the borders of Suffolk, is Boxted Lodge, the residence of Mr. Fisher Hobbs, a distinguished stock breeder.

His improved breed of Essex pigs is well known at all the great agricultural shows. They are perfectly black, rather a small size, and of somewhat delicate appearance, peculiar for early maturity and fineness of flesh. They are superior to any other breed as "jointers," of 50 lbs. weight or so, for the London market, which weight they make at about three months old. When kept to a greater age they feed well, making, with good management, a score, or 20 lbs. weight a month; a 10 months' pig usually weighing 10 score. The breed being kept perfectly pure by Mr. Hobbs is in much demand for crossing. With the Berkshire it makes an excellent cross, keeping its properties of early maturity with increased size. All the perfect animals are retained by Mr. Hobbs for breeders. They are sent to many parts of the United Kingdom and abroad, and are so much in demand that 10 guineas each is commonly realised. One litter of 12, which we saw, Mr. Hobbs expects to sell before the end of the year for 100*l.* Besides pigs Mr. Hobbs keeps a very pure breed of Leicester sheep, Hereford cattle, and Suffolk horses. His agricultural management is also deserving of notice. Having lately succeeded, by the decease of an aged relative, to the estate he now occupies, he is actively engaged in its improvement, levelling down unnecessary fences and abrupt eminences, clearing the land of superfluous timber without sacrificing its natural beauty, grubbing out useless underwood, forming irrigated meadows, opening up better roads of access to the different parts of his farms, and by a better style of cultivation adding fertility to his fields and affording constant employment to his labourers. The residence of such men as Mr. Hobbs, Mr. Mechi, Mr. Hutley, Mr. Baker, and the Messrs. Ward, in different parts of the county, must give a great stimulus to the development of the agricultural resources of Essex.

In concluding our observations on Essex, we may point to the fact that hitherto the chief dependence of the farmer has been on his corn crops, stock being kept for manure, but not generally as a source of profit. Considering the proximity of this county to London, and the consumption of milk which might ensue if the enormous population of the metropolis could obtain a supply of good milk on moderate terms, we are of opinion that farmers would find it very advantageous to turn their attention to this source of profit. Intersected as the county is with railways, there is nothing in the distance to prevent daily supplies being sent to London, and milk is a commodity in which we are not likely to have much foreign competition. To obtain a supply of this on the clay farms, we should expect a system of house-feeding on Clover and Tares in summer, and on Mangold Wurzel, Cabbages, &c., in winter—the most economical, while it would also provide an advantageous means of converting into fertilising matter the haulm which is now looked upon almost as a nuisance by many Essex farmers. *The Times Commmissioners.*

BOX-FEEDING, THIN-SEEDING, &c.

Error in pluribus est; correctio autem in paucis. *Ambros.*
Non errare angelicum, est; errorem defendere diabolicum. *August.*

THE readers of the *Agricultural Gazette* will remember that some months since, on closing the discussion on box-feeding, I stated it was too monstrous an abomination to continue long; but that returning better sense in its advocates would soon induce them to abandon it; and that ultimately it would become a mere matter of history, and of wonder that such a monstrosity had ever existed in this country.

It will be remembered also that I gave an account of three ranges of "cattle boxes," which I inspected, being the most conspicuous and extensive of all I had seen. The owner of one of them, which I will call No. 1, became ashamed of his boxes as soon as he had read my article condemning them; and he told me that had the article appeared before he sunk his abominations, the lives of several fine beasts which had died in their filthiness from diseased lungs would have been saved, as he should have kept them clean and above ground. No. 2 was a range excavated *secundum artem* by my esteemed friend Mr. Mechi, and when I examined those "boxes," they were in glorious operation, having as much filth and effluvia in them as the most loving advocates of the nuisance could desire. The cattle, also, had their sides and legs delightfully plastered over with a mortar composed of their own liquid and solid excrements. No. 3 was a fine range of buildings, and really the best boxes I had seen, but as three oxen only had died in them when I visited them, I notice them on the present occasion no further than merely to observe that I had not forgotten them. I return then to No. 2, that is, to Tiptree-hall boxes. About 12 months since all my esteemed friend Mr. Mechi's thoughts seemed to dwell on the beautiful working of his boxes; they were then in perfect working, dark, dismal, cadaverous and offensive enough even for the inventor himself, and as I groped my way at the head of them I heard a man down in a box with a currycomb puffing and blowing, and scrape, scrape, scraping the clotted dung off a restless and fidgetty beast in his muck dungeon. I explained to the worthy proprietor that I preferred light, pure air, and cleanliness for cattle, as I did for myself, and not darkness, noxious vapours, and filth; but my friend replied, that his boxes were perfect specimens of the system of box-feeding, and in complete and profitable operation, and that my objections to them arose from my ignorance of the virtues existing in pits sunken 3, 4, or 5 or more feet in the ground, and full of liquid and solid animal excrements, and particularly to the cattle in them, and that the manure thus made was wonderful as a fertiliser. Of course, having for many years adopted a different opinion and system, I bid adieu to my friend for that time, he retaining his sentiments and I retaining mine, as is often the case with other disputants, and in other matters of more rationality.

But time rolls on, works wonderful changes, and thus it has been with my esteemed friend, Mechi, the box-feeder, and myself. A fortnight since I visited my friend again, and, although I found he had five times, or ten times, or even a hundred times, for aught I know, more cattle than formerly, yet he has now not one single box, they having, as I said they would be, all become a mere matter of history at Tiptree-hall, and are now remembered only as things that had been, but are not. All my friend's living-cattle graves have lately been covered over with open frameworks of boards, fitted close enough together to prevent the cattle from falling through them and being smothered in the cloacæ below, but not so close as to stop the excrements from dropping through; for, although my friend now repudiates the cattle being forced down into

the cloacæ, he still retains the opinion that the effluvia arising from the fermenting and putrefying masses of animal excretæ immediately under his cattle have a very beneficial effect upon them. Hence, Tiptree-hall homestead is now excavated into a number of cattle cloacæ, and all immediately under the beasts, which are enclosed over them, recreating, puffing, blowing, and fattening in vapours, which, had I not witnessed to the contrary, I should have thought would have destroyed them all in less than 24 hours. And, oh! what numbers of pigs; there were pigs of all ages and sizes stalking about in an open pen up to their bellies in their own excrements; and, as my friend and I passed along it was delightful to hear him explain how clean and decent they were, leaving no offensive matters on the boards, but causing all to glide into the cesspools below, whence they sent up the exhilarating and fattening vapours, cheering and perfuming the happy cattle above. But another feature in my friend's new system is still more wonderful and deserving of notice—he is now enabled to dispense, he says, with straw bedding for his cattle, having learnt the art of transmuting that article, formerly so requisite for litter, into nutritive food, as the adepti in past ages transmuted lead and iron and other base metals into pure gold. I examined the laboratory in which the mysterious operations were going on, and even saw some of the precious elixir by which the transmutation was effected. Two young alchemists were engaged upon these mysteries, and I was pleased to see how the chopped straw was thrown into an alembick full of the boiling elixir by them; and how quickly it was changed into hay and corn, and as effectually as old people at a fair are ground young in a mill. This was a pleasing and a valuable operation, and I have no doubt but it will very soon become as general as box-feeding was 12 months since, though that mystery is now almost defunct.

I must, however, not conceal from the readers of this article that, on examining the straw after it came out of the precious elixir, it appeared to me to be no more hay and corn than it was before it was thrown into the mysterious cauldron; but that it was nothing but straw still. But the adepti attributed my want of discernment to my ignorance, and perhaps that was the case; but I still think that the transmutation is merely imaginary, and that straw, valuable as it is for cattle-bedding, is nearly worthless for food for them: my friend's cook will make rich soups from chips of wood as easily as he himself will cattle food from straw.

Hence, although my friend, in reference to his cattle and pig feeding has made an upwards motion by covering over his cloacæ and raising his cattle out of them; yet, in my humble opinion, he has merely changed one error for another, and is as far from the simple and natural plan as ever he was.

"Incidit in Scyllam qui vult vitare Charybdim"

is an ancient proverb, which my friend Mechi in this change seems to have verified to the letter.

But I have another crow to pick with my friend. Until last year he was an eloquent advocate of agricultural improvements, and particularly for the seeding of land with a rational quantity of seed only. In this he demonstrated as clearly as possible that the quantity of seed generally used was doubly or trebly too much; that it both exhausted the soil and produced less crops than a rational quantity, and that it produced an abundance of impoverishing straw, but very little corn. But since my friend has discovered the precious elixir of transmutation, and has erected his apparatus for the turning of straw into hay and corn, he has changed his system of corn-growing as effectually as he has his cattle-feeding, and is become one of the thickest seeders, if not the ultra-thickest seeder, in the county of Essex, or of any county. In examining my friend's corn fields a fortnight since I found that the corn had been thrown into his rows as if it had been shovelled in for the double purpose of seeding and manuring the land with it. I took up handfuls after handfuls of Wheat plants having from 14 to 20 grains of seed to each of them, and half a dozen of such handfuls were in a space not too large for one single grain to come to maturity in; in fact, I never in my life saw land thicker seeded than my friend Mechi's now is. Now, why this sudden change from an advocacy of the thinnest to the practice of the thickest possible seeding? Surely if in 1847 to seed land thin was wise, it was wise also to do so in 1849. But my friend replies, not so; that he has lately discovered that thick-seeding is right and that thin-seeding is wrong. Then, I ask, why did not my friend make this discovery before? But what proof have we that he was not right in 1847 and wrong in 1849? and that he was so I have not the least doubt whatever, and will here prove that he was. But my friend may retort upon me, and say that corn is so cheap now that he cares but little about it, and especially as by his transmuting straw into fattening food for cattle, straw is more valuable than corn, and so he changes with the times, and grows an abundance of straw instead of corn. This reason may appear feasible, but it will not bear examining. It is easy to demonstrate that straw alone cannot be grown but at a very great loss, that it is nearly worthless as food for cattle, and is fit only for litter and manure; whoever, therefore, grows more straw than is really requisite for a good crop of corn, does so at a great and ruinous loss to himself and his country. But on my remonstrating with my friend on the enormous thickness of his crops, his reply was, that he should "flag" his Wheat, and that he had discovered that 6 pecks an acre was the minimum quantity of seed Wheat which ought to be sown, for he could flag off the superfluous growth. Now, my friend, permit me to reason with you; you should flag your Wheat, you said, but is there a more barbarous operation in existence than the flagging of Wheat? the flags are the lungs of the plants, and you cut them off just when they are the most wanted to feed the plant. But you were a thin-seeder, and you discovered that thick-seeding was better: 40 years since I assisted in dibbling an acre of land with 1 peck of Wheat, and ever since that time I have advocated and practised thin-seeding, and it has never failed me. This year I have a field, a part Wheat for the fifth time, but the greater part Wheat the fourth time in five years. The seed was—a part 2 pecks an acre, a part 1½ peck an acre, and a part not 6 quarts an acre. Now, I will back an acre of this field against any acre of Wheat on Tiptree-hall farm, and if I am allowed to choose my acre I will undertake to produce 3 coombs more upon it than there shall be upon any acre on Tiptree-hall farm. But perhaps my humble doings may be thought unworthy my friend's notice; but if so, I will back two of my parishioners' farms against my friend's, and one farm upwards of 200, and the other upwards of 300 acres of arable land. I will take 20 or 30 acres on the larger of these farms; for every 3 pecks of seed sown on them, the produce shall be equal or superior to every 6 pecks sown at Tiptree-hall farm; or, I will take the smaller of those farms, and for every 5 pecks there the produce shall be equal to the 6 pecks at Tiptree-hall, nor do I see why my small occupation should be despised. I have a field of Beans, a field of Barley, and a field of Wheat. The Bean-field is miserably poor and full of Twitch Grass, as it only came into my possession last autumn when I had not an opportunity for cleaning it. The Barley field was drilled with only 2 pecks of Barley an acre; it was Barley also in 1847, 15 coombs and 3 bushels an acre; Barley in 1849, nearly as good a crop; and I have a field the fourth time Wheat in five years. A part of this field was drilled with 2 pecks an acre, a part with 1½ peck an acre, and a part was transplanted with plants from the other parts pulled up for that purpose. Now, I will back the Beans against any at Tiptree-hall, the Barley against any Barley at Tiptree-hall, and the Wheat against any Wheat at Tiptree-hall, and if that part of the field be chosen where the least seed was put in, I will undertake to have, as I have stated, 3 coombs an acre more than on any acre on Tiptree-hall farm. And should my friend not deign to contend with me this year, I will take my Bean-field next autumn and seed it in his presence with 12 times less seed than he has proclaimed to be the minimum quantity he can produce a fair crop with, and still I will beat him by 2 coombs an acre. Nor, let my friend suppose, that I make these challenges to him in a hostile spirit; by no means: but, on the contrary, I esteem my friend too much for that, but I challenge him on public grounds alone. My friend proclaims that he cannot grow a good crop of Wheat with less seed than 6 pecks an acre; I undertake to grow more from my 6 quarts an acre than he can from 6 pecks; but I do not boast of this. I am pleased nevertheless at seeing some of my parishioners and neighbours, but particularly some of my parishioners, following my example, and with half the quantity of seed that appears to be requisite at Tiptree-hall producing a larger produce at harvest, and in my opinion also of a better quality. This is cheering, because I feel satisfied, that when men have once reflected upon and proved that my friend's minimum quantity is full from 6 to 12 times more than is requisite in skilful hands, they will learn to use their own judgments, and at length sow no more seed than nature requires, and that is a very small quantity indeed.

Both my Wheat and Barley this year is at least five times too thick for a truly fine crop, and the former did not average 1½ peck of seed an acre, and the latter was but exactly 2 pecks. In conclusion, Mr. Editor, permit me to invite, through your journal, those numerous gentlemen who have favoured me with their correspondence, and others, also, to come to Wix and see my doings; I will undertake to show them such growing corn as they shall not find in any other part of this country, and I add it will give me a pleasure to see them. I will also exhibit to them the two-horse drill I invented and made for my use, my horse-hoes likewise, and one of my friend Dr. Newington's patented dibblers, the first of which was first used on my land. *George Wilkins.* P.S. Wix is six miles from Manningtree Station.

Home Correspondence.

Agricultural Errors.—Though it is an unpleasant task, it may nevertheless be a friendly office to point out errors, that they may be corrected. It is a very common error to think that large farms, low rents, high prices, and richness of land, are requisite to enable farmers to cultivate profitably. These, if the farmer be equal to the most perfect management of a large farm, are all of them extremely desirable. But we have known tenants unthrifty with all these advantages combined. We have also seen others thriving on well cultivated farms, possessing few or none of these advantages—thus proving the possibility of doing so; for "what one man has done, another man may do," or even surpass his teachers, for every succeeding generation should be wiser than their predecessors, having, in addition to the experience of the past, the discoveries of the present; and each new improvement being a step towards still further advances. Many years ago, when corn and stock were very high, I noticed a fine estate belonging to a kind landlord, who, like his father before him, never raised a rent or discharged a tenant, but let his farms so low that the tithe was actually valued at more than the rent; and yet, though the situation was good (only that some fine land was dispersed in distant parts of large open fields), the tenants did not thrive, and many of them had commonly to go to "Borrowby bank" for a part of the rent. And why did not the farmers prosper with such advantages? I answer, the lowness of the rent made them careless; for rents may be too low, as well as too high; and much of the land laying dispersed about open fields, and some of it far from the homestead, they could not, if ever so desirous, manage it as well as if it had been laid out in compact farms of moderate size, with a homestead near the centre of each. Besides this, they were like men working "the chain gang," unable to exert their powers to the best advantage, for they were bound to the unprofitable, and even yet not very uncommon system, of two white corn crops and a summer fallow, and the preservation of a wasteful stock of game. This was the more absurd, as a considerable portion of the estate, if enclosed, was suitable for Turnips, Barley, and seeds. On this latter system, or something like it, other land, which formerly was considered unworthy of cultivation, has for several years been producing grand crops, and fine flocks, under the management of enterprising and thriving tenants, paying for land of natural inferiority, far higher rents to judicious landlords, allowing and encouraging their tenants to make the most and best of their farms, by good cultivation, without fettering them with improper restrictions, or taxing them with the keep of an unreasonable stock of game. Thus the landlord's portion, and the tenant's too, was very small in one case, and very fair in the other; and the condition of the labourers resembled that of their respective employers. While the fox-hunting squire, and travelling lord, could obtain small rents from illiterate, servant-like tenants, they went on easily, without aiming at any improvement. But since the prop is removed, efforts are required to make great improvements. As both landlords and tenants have been accustomed to grow heedlessly together in past times, so now, they must unite their exertions to make such progress as is consistent with this age of progression. *An Old Farmer.*

Farming Accounts.—The Dutch have a proverb that "no one is ever ruined who keeps correct accounts," and this saying, there is no doubt, contains much truth; and if it applies to the merchant, trader, and manufacturer, it must do so still stronger to the farmer, whose business it is by small outgoings to create a stock, which at the year's end shall afford, in addition to returning the expenditure, a surplus for his remuneration. But farmers are seldom accountants; it does not enter their ideas that a knowledge of booking can be a necessary part of their education, and yet what is more evident than the occasion for their knowing not only what proportion their general expenditure bears to the gross returns, but that they should also be aware in detail of the cost and returns of the several products of their farm, so that they may ascertain not only their position as to profit or loss at the year's end, and be able to develope the profitable branches of their farming by a sacrifice of the unprofitable; but, further, that they may readily estimate the advisability of a practice or of an outlay by a calculation of the cost and return. It is to the neglect of this very important branch of education, to the want of this aid to good farming, that great numbers of landowners as well as farmers sink their money so unprofitably. They are led into plans by gross returns, without a knowledge of the cost, and then fancy their lost capital has gone in improvements or amendments of their land, which are to make a return hereafter. When, in reality, some vicious system, some false views of profit have swallowed it. I often see land yearly depreciating, but which the owner or occupier fancies he must have been doing much to greatly improve, simply because he finds he is yearly becoming poorer by his use of it. How often does the stock master, delighting in his stock, reconcile the consumption of nearly all his produce, the appropriation of half his farm, to the maintenance of animals which at the year's end give but a comparative trifle for their keep, with the impression he shall recover their cost in the return of grain. A better system of accounts, an accurate knowledge of the cost on one side, and of the return on the other, would often set many right who are going very wrong indeed. Figures should be the farmer's test of every operation, every system should undergo a comparison of cost to the return. Why should manufacturers, traders, and merchants, be governed by their estimates, and their debtor and creditor accounts, and farmers not? I confess I like the present cry for balance sheets, for my early education was a mercantile one, and much I owe to it; but at the same time the desirability of figure proof be admitted, we must not forget that good farming when first planted requires time to produce fruit—it is a tree which takes years of care and attention before it blossoms. Four or five years must be expected to pass before it must be regarded for its returns. The greater the occasion therefore for accounts, to distinguish money lost from money invested. On a future occasion I will go into details as to the books a farmer must keep to correctly understand what he each year is doing. *Hewitt Davis, 3, Frederick's-place, Old Jewry, London.*

Value of Manure.—Mr. Mechi, in your Paper of the 4th inst., reverting to his live stock account, estimates the value in manure created by the consumption of his green crops and bought food, and this value he treats as a credit. But he must debit his Wheat crop either

with the cost of the green crop or with the value of the manure, and in either case the charge amounts to not less than 3*l.* or 4*l.* per acre, as I showed in a former comment. I repeat the question, can this pay? I am no enemy to high farming, but as Mr. Mechi is a man of figures (as we all ought to be) I want to see him work out his calculation, as it is important not to deceive ourselves or one another. I must say that I quite agree with "Amicus Tull" that high farming if carried out by many must cause overproduction; and that it cannot be relied on as a panacea, though it may be made very advantageous to particular individuals. I may add, with reference to "Amicus Tull's" project of successive Wheat crops, that from the time of Tull it has been frequently attempted and given up after a few years' trial. Wherever I find mention of it, it has been accompanied by horse or hand-hoeing, in order to keep the land clean; and Cobbett, who edited Tull's work, gives as a reason for the failure of the plan, that the additional culture keeps the crop in a state of growth too long, and makes the ripening late and the harvest uncertain and critical. Still, under some modifications, and with the aid of improved hoes, which would enable the rows to stand closer together, thus facilitate the earlier maturity of the crop, the experiment might perhaps be tried again with a prospect of success. Indeed, I believe it has been tried, and is still in course of trial on garden ground at West Dean, in Sussex, under the auspices of the Hon. and Rev. Vernon Harcourt. *A. H. Hall, Watergate, Petersfield.*

Wages of Labourers.—Under this heading I was pleased to see, in your last publication, some remarks on the practice, in Herefordshire, of giving cider to farm labourers, as part of their wages, and from which it would appear that it was almost impossible to break through this baneful, absurd, and ridiculous custom, whereas the contrary is the fact. I have, for some years past, though farming in the middle of the county, discontinued and discountenanced the practice by every means in my power, and in lieu of cider, or other liquor, give an equivalent in money; and among other advantages, thus avoid my house being beset every morning by applicants for leave "to be drunk on the premises," as the excise vocabulary runs, whilst it at the same time affords them the means of purchasing what drink they require; and I found that, generally speaking, I get a better class (certainly the more sober) of men about my farm; they stick to their work more regularly, do it better, and earn more money; and though they of course purchase liquor of some sort, I invariably find that what, under such circumstances they deem sufficient, is little more than one-half the quantity they stipulate for when it forms part of their wages; but in making this allowance it is of course necessary to have regard to the price at which it can be procured by them from the retail dealer. By this plan more money is taken home on pay night, and the wife and children are benefited, instead of an unnecessary portion of the labourer's wages being selfishly swallowed in drink. The second plan answers equally well at all times; in harvest, for instance, when cider generally is given in wasteful profusion, I find it answer so well that I rarely see a drunken man about my premises. At this period, when a number of hands take a job together, say reaping, they often purchase half a hogshead or a hogshead of cider on wholesale terms from some neighbouring farmer, and for which I make myself responsible, pay, and charge them with the amount consumed on a final settling, finding them of course a safe place to keep it in, and a tap key for their own use. They thus can have what they require; and I find that they consume less than they would expect when, as I have said before, it is given as part of their wages. I hold the practice of paying a mixed wage to be analagous to the truck system, bad in principle and demoralising in effect, and consider that it is much better that the labourer should receive the full value of his hire in money, in order that he may spend it in such a way as he may deem most profitable to himself and family. I am aware that many farmers, having to pay rent for large quantities of orcharding, object to the system for which I am contending upon the ground that they might find some difficulty in disposing of their cider; but this is, I submit, to a great extent a mistake, inasmuch as an ample demand or consumption would be still kept up, the difference being merely the channel of demand and supply, and I admit this amount of consumption almost with regret, because I am fain to regard the great quantity of orcharding in Herefordshire as the curse of the county. We have, perhaps, taken as a whole, one of the deepest and naturally most fertile soils, in England, in too many instances inefficiently cultivated, not so much from the negligence or otherwise of the farmer, as from the besotting influence of cider on the labouring classes, rendering them physically inactive, of inferior mental capacity, and frequently inducing premature infirmity; whilst other counties, not possessing the same natural advantages, but happily without orcharding in excess, have, mainly by the superior activity, health, sobriety, and intelligence of the labouring class, been raised to the highest state of cultivation. I by no means intend to say that men can be expected to sustain a hard day's toil out of doors, and especially in hot weather, without drink of some kind, or that such drink should be water only; but what I mean is that it should not be supplied to them as part of their wages—that they should receive the full value of their hire in money. *Thomas France, Massey Hall, near Ledbury.*

Drilling. — Nothing can show more strongly the backward state of farming on a large part of this kingdom, than the little progress which has been made in the drill system for the cereal crops. Here is a system the most beautiful in theory, the most ingenious in contrivance, and the most perfect in practice that can be imagined, invented by Jethro Tull, now much more than a century ago, yet at the present time it is still in many places quite unknown, in others only partially or imperfectly executed. Nor do we seem to be making much more rapid advances towards the attainment of it. Some there are who profess to teach others in the art of agriculture, and therefore might be supposed to be more conversant with it in its higher branches, yet seem to know no more about Tull, than they are likely to do about Tully. It highly becomes these, unless they could sit down content with that mediocrity of performance, suited rather to the plodding husbandman than to the enlightened agriculturist of the present day, to study the works of this long neglected sage, to use their utmost endeavours to bring them before the public, and to the means of carrying out into practice the principles and elements which he lays down for scientific husbandry; and of whom Cobbett (no mean authority) says, that till he read Tull he knew nothing of these principles; but what struck him most forcibly, when he came to read Tull, was, that all that he had read before, with anything like principles in it, had been stolen from him, shockingly disfigured indeed, but still, whatever there was of good, was his. Now what are the objects which Tull points out are to be attained by the drill system? 1st, the regular and economical deposition of the seed; 2d (by far the most important part), the after culture. It is to be recollected that it was on the principle of deep and thorough tillage that all the great work of Tull was performed—that of raising capital crops of Wheat for a number of years running without manure; and when this so great an effect is produced from such a cause, does it not stand to reason that every effort should be made to bring the soil into a fine friable state, not only before the seed is sown, but also after the plant has appeared above ground? Tull says (p. 197), "The horse-hoeing is performed after the great frosts are passed, and when the weather will allow it. As to how many times Wheat is to be hoed in the summer, it depends upon the circumstances and the condition of the land and weather; but be the season as it will, never suffer the weeds to grow high, nor let any unmoved earth lie in the middle of the intervals long enough to grow hard." A feeble attempt has been made in some cases to introduce the drilled system, but it is much to be doubted whether in this the objects just pointed out have been at all attended to. Much as I admire the superior farming of the Lothians, their noble fields of Turnips from 50 to 100 acres, and a great deal of their management, yet I may be allowed to say they are deficient in the particular to which I have just alluded, of which I may here give an instance. Having been taken by a very intelligent conductor to visit one of the crack farms near Dunbar, I remarked to the tenant that I had not seen in Scotland any of the drilled husbandry, to which he replied he had a field of Wheat drilled. On inspecting this field we found it drilled at narrow intervals, but it was a poor crop, not more than 23 bushels an acre; and it may be here remarked that at the great show in Edinburgh, in 1847, there was only one drill machine exhibited, and that came from England, sent by Messrs. Garrett. With such an inefficient execution, it would be in vain to expect such a redundancy of growth as a continued course of tillage would assuredly bestow. The greater strength of the stem, the larger size of the head, the more numerous grains in each ear, and those more full and plump, are certain indications of the drill husbandry properly conducted. There is no excuse for this not being totally and fully carried out in the present day, the facilities for it so far exceeding those which Mr. Tull possessed when he invented his first, and therefore rude implement, the idea of which he took from the barrels of an organ. The drill machine of Messrs. Garrett, with the horse-hoe adapted to it, is a most admirable implement. It will also deposit the seed of the Turnip or Mangold Wurzel in a very regular manner. In former years I have always dibbled my Mangold Wurzel, and have invariably had great failures; this year I used Garrett's machine with a small roller, which I had made and fastened to the hinder part of the machine. This effectually kept out the drought, from which we have lately been suffering; and since some genial showers have fallen, the plants have risen beautifully. I do not profess to show any first-rate farming, as I only take farms into my own hands which have been worked out by bad, slovenly tenants. When a farm is one mass of weeds, rubbish, undrained, untilled, and perhaps has to be drained at the time when the Turnips should be sown, it is quite impossible to make any great figure in this way; but it may be here mentioned, by way of proving that present rents may be supported with present prices, that having so had a farm of this kind in hand for two years, I let it a short time ago to an excellent tenant, at an advanced rent. There have been published reports of the farming in this county, and there has been shown in them some good farming in certain parts, but chiefly in those near the large towns of Liverpool and Manchester. This is more like market gardening than what is called self-supporting farms, as they have the advantage of having large quantities of manure cheap, and they can sell their Turnips from 15*s.* to 20*s.* a ton. In these reports it is mentioned that some attempts have been made at drilling; but it is nowhere stated that the after culture has been adopted; and it therefore only resembles the old story of the play of Hamlet being advertised in a country village, with the part of Hamlet omitted. Until this after culture be applied, let nothing more be said of the drill system being used. I hope to show at some future time, from undoubted facts, in a field grown in three different ways, the far greater produce there was from the drilled part over that which was sown broadcast. Messrs. Garrett's machine and horse-hoe are expensive in the first instance; but so great are the advantages arising from them that on a farm of considerable size it is believed they will repay the cost almost in a single year. *Law. Rawstorne, Penwortham, May 25.*

Italian Rye-grass.—I shall be much obliged by your opinion, or by the experience of any of your correspondents, as to the practicability of making Italian Rye-grass a permanent crop by periodical top-dressing and renovation by fresh seed. My plan has been, for some land capable of irrigation, to dig it up every third year for a crop of roots, which year I lose much of the advantage of irrigation, and moreover the soil is made so loose that a great proportion of the water is lost through the drains. *T. Green.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House in Hanover-square on Wednesday last, the 12th of June: present, Mr. Raymond Barker, V.P., in the Chair; Earl of Lonsdale, Hon. R. H. Clive, M.P., Hon. Dudley Pelham, M.P., Sir Montague Cholmeley, Bart., Sir E. M. Elton, Bart., Mr. B. Almack, Mr. Bastard, Mr. Berners, Mr. Burke, Mr. Burton, Dr. Calvert, Mr. Clavering, Mr. Capel Cure, Mr. Dyer, Mr. Fuller, M.P., Mr. Brandreth Gibbs, Mr. Baskerville Glegg, Mr. S. Grantham, Mr. P. Love, Col. MacDouall, Mr. Lennox Naper, Mr. Parkins, Mr. Pendarves, M.P., Rev. Reginald Chandos Pole, Mr. T. Rowlandson, Prof. Sewell, Prof. Simonds, and Prof. Way.—Colonel Morris, Vice-President of the New York State Agricultural Society, attended the meeting.

The following new Members were elected:

Gomm, Lieut.-General Sir William Maynard, K.C.B. (Commander-in-Chief of the Forces at Bombay), 10, New-street, Spring-gardens
Shelley, John, Avington, Hampshire
Mules, Rev. James, Yarnscombe, Barnstaple, Devonshire
Carden, John, Barnane, Templemore, Ireland
Woollcombe, Rev. H., High-Hampton, Crediton, Devonshire
Feilden, H. Master, Croston Lodge, Chorley, Lancashire
Woollcombe, John M., Ashbury, Okehampton, Devonshire
Cotton, H. P., Quex Park, Isle of Thanet, Kent.
Gibbs, Robert, Carhampton, Dunster, Somerset
Barnard, Rev. Mordaunt, Little Bardfield Rect., Braintree

The names of six candidates for election at the next meeting were then read.

Steeping Wheat.—Mr. James Smith, of Wainfleet, Lincolnshire, informed the Council that arsenic having been used this season, by two farmers of his acquaintance, for dressing Wheat, Barley, and Oats, previously to sowing, had proved unnecessarily destructive to the feathered game on their land. He was desirous of ascertaining whether some other equally efficacious, but less deadly poison, might not be employed for the preparation of seed-grain. Mr. Fuller, M.P., corroborated, from his own experience, the destructive effects attending the use of that mineral.—Prof. Sewell had recently seen a statement of a very large number of sheep having been poisoned from the same cause.—Mr. Dyer had found blue vitriol most effectual for steeping grain.—Mr. Raymond Barker had been in the habit of using dry lime with great advantage.

Lime for Slugs.—The Rev. Thomas Cator, of Skelmersdale-park, near Pontefract, communicated to the Council a statement of the mode by which Mr. Leetham Reynolds, one of his tenants, had in 1837, and subsequently, prevented the ravages of slugs, by applying lime to his Clover and Seed-leys, before ploughing them up in the autumn; a plan which had been extensively adopted afterwards by the other tenants of Mr. Cator in that part of Yorkshire, and with the same success. The lime employed had been that obtained at the Womersley quarry; and it had been applied at the rate of three "dozens" to the acre. In one case, that of Mr. Geo. Stones, of Stubbs-Walden, a single acre, in the middle of a six-acre field, had been limed before ploughing up, while the remaining five acres had been left in their ordinary state, the whole of the six-acre field being afterwards submitted to the same uniform management. The result was, that the crop on the single acre was full and good, while on the other five acres the roots were nearly all destroyed by the slug, and had to be resown.—Mr. Almack and Prof. Way thought the lime might probably have had a greater action on the growth of the Clover-plant than on the slug, which was often known to withstand the application of lime, especially in dry weather. At the suggestion of Mr. Almack, inquiries were addressed to Mr. Reynolds, on the following points:—1. The peculiar quality of the lime, its difference from the Nottingley lime, and its chemical analysis, if made. 2. Its state, on application. 3. Rate of bushels applied per acre; and definition of "dozens" of lime. 4. Interval of time between application and breaking up the ley. 5. Whether the application of the lime occasioned a decided increase of growth in the Clover.

Ventilation of Drains.—Mr. Turner, of Barton communicated a statement made to him by Mr. John Piper, a tenant of Lord Ashburton's, residing on a farm of 300 acres, at Bucklandfilleigh, near Crediton, on the success with which he had employed for the last 12 months a system for the ventilation of the pipe and tile

drains on his lands, which promoted the passage of water through them, and prevented their "blowing up:" a system, as far as he, Mr. Piper, was aware, which he had been the first to employ, having devoted his attention for the last 12 years to the theory and practice of land-drainage; and in consequence of the perfect state of drainage to which one of his fields had been brought, it had now growing upon it a crop of Wheat, such as he believed had not before been seen in that part of the country. His plan of ventilation was very simple, economical, and durable, and offered no obstacle to the working of implements in the subsequent preparation of the land: it would increase the flow of water through the drains in wet weather, admit the air into them during the summer months, and prevent the growth of fungi within their recesses. Mr. Piper did not enter into a detailed statement of his plan, but referred simply to the principle on which it was founded, namely, the free admission of atmospheric pressure.

Diseases of Cattle.—Prof. Simonds took that opportunity of returning his thanks to the Council, for having again done him the honour to request that he would deliver a lecture before the Members of the Society at their country meeting: a request with which he most readily complied. The subject of the lecture, as requested by the Council to be delivered by him at the ensuing Exeter meeting, namely, the Liver in Domesticated Animals, would enable him, he hoped, to lay before the members some views and details of great practical value in reference to the diseases of that important organ of the animal frame. Its structure was thought too well known to require elucidation; but there were many conditions connected with its derangement of function and change of structure which were of great interest and importance: of these, the "rot" in sheep, and the "red-water," were familiar instances.—The Hon. R. H. Clive, M.P., inquired of Prof. Simonds the extent of pleuro-pneumonia among stock at the present time. He had himself been a sufferer to a great extent. He had been recommended to give alcoholic drinks to cattle affected with that complaint: he wished to know Prof. Simonds's views on the subject.—Mr. Baskerville Glegg also stated, that in Cheshire the dairy cows had been very liable to the attacks of pleuro-pneumonia.—Prof. Simonds had always been opposed to bleeding in that complaint. He regarded it as a purely inflammatory disease, in which diffusible stimulants might be of service; but in that case, there were better remedies of that class than the alcohol referred to. He had found kreasote a very valuable remedy: but no specific could be safely recommended, so much depended on the stage of the disease and the particular constitution of the animal.—Dr. Calvert inquired whether camphor and ammonia had been tried.—Prof. Simonds replied that the acetate of ammonia and various other preparations of that alkali had been usefully employed in the disease.—Prof. Simonds then stated to the Council the progress of the inquiry he had been directed by the Veterinary Committee of the Society to make in reference to cows belonging to tenants of Lord Portman in Somersetshire, affected for several years with a kind of atrophy or wasting of substance, from some unknown cause. The circumstantial evidence had appeared to fix the cause of the malady on the water the animals had been in the habit of drinking; but Prof. Way's examination detected in that water no ingredient prejudicial to health, and his own anatomical examination of one of the animals slaughtered for the purpose, led to no discovery of the poisonous action of such water. The serous membranes of the body, those in particular of the lungs and abdomen, were much affected. He hoped by the next month to complete his report on this subject, and in it to submit to the Council, through the Veterinary Committee, the whole details of the case. In the meantime, two of the animals had been removed to the Royal Veterinary College, and were rapidly improving in their condition, although only ordinary care was taken of them.—Mr. Raymond Barker thought that in many cases animals were lost from the want of a sufficient amount of wholesome and nutritive food.—Mr. Capel Cure then submitted to the Council the case of disease among his own stock. He had occupied his farm at Blake Hall, in Essex, for the last 30 years. The arable and pasture grounds were very good, and well drained. His stock consisted of 17 dairy cows, 6 bullocks, and 12 calves, the health of all which had been very good until June last year, since which time he had lost 20 of them. The disease had first appeared among the fatting stock, and very little time had elapsed between the attack and death; and it prevailed variously among animals of different age and condition. It had been prevalent in the neighbourhood, but not so severe as in Mr. Cure's case. The outbreak could not be traced to any particular circumstance of contagion or infection. The symptoms were shortness of breath, and other indications of pleuro-pneumonia. All the animals attacked had died excepting one.—This case having been referred to the Veterinary Committee, Professor Simonds has been directed to proceed to Mr. Capel Cure's farm, and to report the result of his inspection.

The Agricultural Society of Caen transmitted various Reports and Essays connected with their proceedings, for which the Council ordered their thanks.

The Chairman informed the Council that Prof. Way's Lecture "On Variations in the Chemical Composition of Water, as affecting its agricultural uses," would be delivered to the Members of the Society, in that place, on the following Wednesday, the 19th inst.; and that the next Weekly Council would be held on the 26th inst.

Farmers' Clubs.

Newtownards and Comber: *House Feeding.*—The following remarks on this subject were made by Mr. J. Andrews, of Comber, near Belfast:—"The addition of Beans or of Peas which may be raised on land too light for profitable culture of the Bean, seems to have supplied everything that was formerly deficient in cattle food, as they contain, in large proportion, those substances which are necessary for the production of the flesh and bones of animals, and thus largely encourage the supply of milk. The Belgians long since discovered this fact, and Beans are used liberally by them during the entire year. Following their example in this as in other matters, I consume the entire of my Bean crop in enriching the food of my black cattle and swine. Each cow in summer receives 2 lbs. daily dissolved in her drink, by steeping 12 hours; and in winter, after 24 hours' steeping, the infusion is applied to moisten the cut straw, Bean-haulm, and hay mixed with chaff, which it was formerly the practice to boil or steam, the boiling or steaming process being no longer considered necessary. The Flax-seed from my own crop, with the husks, is also ground into coarse meal, and is mixed with the Bean-meal before steeping, and applied to the same purpose during the winter. My succession of house-feeding for cattle is as follows:—The first spring food is Rape, which is generally ready soon after the middle of April, and affords an abundant supply till about the 20th May, or a little later, when the Clover is ready for first cutting. From the 29th May till about the 20th June the first cutting of Clover and Italian Rye-grass is used, the portion of Clover not required for green feeding having been converted into hay about the middle of June. From about the 20th June till near the 1st of August, the winter Vetches fill up the place between the first and second cuttings of Clover. The second cutting of Clover having been stimulated by liquid manure, affords a luxuriant supply from the end of July till the early part of September. Spring Vetches, sown the end of May, are then ready, and some of the early Cabbages, which are planted alternately with late varieties, can then be saved from the swine to help the cows. After these Vetches a portion of the Clover affords a third cutting. Late Cabbages come in aid, and I have never been obliged to resort to Turnips till about the 12th November. From that time till April, when the Rape is again ready for use, Turnips, with cut hay and Bean and other straw moistened, as before stated, with dissolved Bean and Flax-seed meal, and aided by a little distiller's pot-ale, supply the winter food. I should add that the Oat-straw, which is not threshed till late in the spring, is reserved and mixed with the fresh Clover hay. The Wheat straw is partially cut down for the cattle, and the remainder used for litter. A small portion of bran, about 7 lbs. per week each, is given with the Bean-meal to the milch cows. The pigs during winter are fed upon boiled Turnips, with a little sour buttermilk, and the refuse of the house, to which a little Bean-meal is added. From May, when Turnips are out of season, Mangold Wurzel takes their place, and affords excellent food till August. Cabbages succeed, and fill up the blank till Turnips are again ready. By such means pigs may be fed more successfully and in greater numbers than during the best days of the Potato. On our large farm 30 large pigs were fed during last summer in the manner I have described. The house-feeding of so large a stock produces an abundant supply of manure, which is preserved in a waterproof pit, into which all liquid from the byre is conducted by a pipe, all surface water being excluded. Your attention is directed to this mode of preservation, as simple and effectual. The dressings of manure being frequent are not heavy, and they are aided by vitriolised bones, which we prepare ourselves, about 1 cwt. of bones per acre so dissolved being strewed on the manure when put into the drill for the Turnips; and a similar quantity being applied and worked into the spaces between the drills of Beans, during the cleaning process. Twenty barrels of lime in flour are scattered over the drills of the Turnip field, which is intended for Wheat and Clover seed the following year, after the Turnips are sowed and rolled down, which I consider the best time and mode of applying that useful substance." *Quoted in the Scottish Farmer.*

Hadleigh, *May* 15: *Annual Meeting.*—In the course of the evening Mr. Mechi said,

He had all his animals on boards, and was extending the operation; and he assured them they would succeed as he had done in making better manure, more manure, and more meat, by having their animals on boards, instead of putting them on straw and removing that straw after it had been worked into muck, and turning it over and recarting it after it had lost many of its valuable properties. Instead of that let them take the pure excrement from the animals, carry it on the soil, and plough it in, and he was sure their crops so treated would exceed those grown with the primest guano. When they came to see him they might judge of the facts, both as regarded stock and crops; they would speak more than he could on the subject. He should naturally be asked what he did with his straw; he replied, "Eat it," that was, he let the cattle eat it, and he could keep four times as much stock. He could assure them that if they increased their stock in proportion, taking care to add something better to the straw, they would get more manure, of a better quality, and grow more corn. He thought the time was coming when the old system of management—of a small quantity of stock, and a large quantity of land—would not do. He thought the landlords would have to reform as well the tenants—that they would be obliged to provide better buildings—that the little fields must become large ones, and that the tenantry should pay rent for land, but not for timber and fences. (Cheers.) He thought the spirit of the age was opposed to the retention of antiquarian customs not at all adapted to the present population, and the keen competition going on in the struggle for superiority. It was inconsistent with practice that they should retain the antiquities of agriculture, and one of the great benefits of such meetings as these was that they enabled the farmers to speak their sentiments, with a due regard, he hoped, to every interest in the country, and at the same time with a due regard to the interests of truth and progression. (Cheers.) He thought also that they did not manage their cattle well, that was, that they did not administer their food in the best mode. He was convinced that one-half the food administered in the usual way passed through the animal undigested. If they would do as he had done, and pour water on the excrements of the various kinds of cattle and horses they fed, they would be astonished to find uncrushed Beans and even uncrushed Oats and oil-cake—it would be found almost in an entirely natural state, undigested. This would lead to the consideration whether it would pay the farmers to administer a smaller amount of food, but to render that food perfectly available to the stomach of the animal? He had lately been visited by two or three agriculturists, who said they were making money in these difficult times by stock, and he was naturally led to inquire how it was that they succeed, for he could not do so under the old system—(cheers)—and he was bound to say that they succeeded by adopting the principle he had been explaining. For instance, one gentleman said, "You give your oil-cake in lumps, which are indigestible; I grind the oil-cake after having been broken up; I grind it through mill stones, and render it into flour, then it is put in water 24 hours till it becomes mucilaginous, and I find, in practice, a moderate quantity is better and more advantageous to the animal than double the quantity given in lumps." He (Mr. Mechi) had found the result much as stated. If they endeavoured to soak oil-cake in water, in the way in which it was usually given, viz., in lumps, they would find it remain for days in the water and not become soluble. (Hear, hear.) He must think they were making a great mistake in giving so much food to their animals at so great waste. A bullock would not put on more than 2lbs. of meat per day, probably not more than one, and the average very likely would not be more than one and a half; a stone per week would be doing very well; 2 lbs., at 5*d.* per lb. would be 10*d.* a day. If they gave that animal half-a-crown's worth of food, which was often done (generally 2*s.* worth), he could not pay for it. He might make muck in return for his food; but it was impossible that he could pay for more than a given quantity. A shrewd Scotchman, Mr. M'Culloch, of whom no doubt they had heard, said to him the other day, that he could never make a beast pay for more than 5 lbs. of meal or oil-cake per day, and when he gave that he crushed it to macerate it, he cooked it and mixed it with chaff and hay. His friend, Mr. Everett, he observed, was shaking his head; but he would refer to any man or boy on his farm, who had seen his bullocks before he adopted the plan, as to what had been the result of this system. They would all agree that the animals had progressed 50 per cent. more after adopting it, and at much less cost. He merely stated this fact to the meeting, and the experiment was one which he thought every one was bound to try—it was well to see if they could not get a little more money, or lose a little less. But let them remember that, as he was annually to produce his accounts, it was of no small importance to him, and of no small importance to the community, that he should be able to carry on his business in the best way—that was the sole object of experiments. He had said before that his animals were all on boards. They might exclaim "What an expensive way that must be, what a quantity of buildings must be required?" He assured the landlords of the country, whose duty he considered it to be to put up good buildings for good tenants, that brick and slated buildings of the best description, with boarded floors, could be put up, at an expense (if they wished or should choose to charge their tenants 5 per cent. for them), of only half a farthing per week for each pig or sheep, to keep that animal in the best way, and his manure in the best possible condition of dryness and availability; and for a bullock ¾*d.* per week would give him an excellent lodging. He was particular on this point, because he was laying out 200*l.* or 300*l.* additional, and from a close calculation of the cost per score of slating, flooring, and every part connected with the buildings, he was charging himself 10 per cent., and a fat hog only paid a farthing a week for his lodging. (A voice: "Is washing included with lodging?") He assured them that the animal neither required washing nor bedding, and it was one of the beauties of this principle that they might have 1000 bullocks, hogs, or sheep on boards, and they would neither require sweeping, littering, or attending to in any way beyond the mere act of feeding them, yet they would be as clean as possible, and fit for a lady's drawing-room. (Laughter.) As his friend Everett would say, he might be thought to be coming it "rather too strong," but it was perfectly true. He was often asked the question by those who came to look at his animals, both bullocks, pigs, and sheep—"How often do you sweep the floor?" Not at all; they sweep it themselves. He assured them that by the addition of a little gypsum on the boards, the ammonia was perfectly fixed, there was no disagreeable smell at all, and the manure was taken away at intervals just as it might be wanted. He had no doubt that in the course of time the farming of this kingdom would generally be conducted on the principle of putting the animals on boards, of crushing their food, bringing it home to them, and carting their manure back again. Nothing could be worse than the management of manure in this country generally. He had often asked farmers how they had grown their best Turnips? "Why, we take out the long manure, plough it in, and let it lay all the winter, and then we have far better Turnips than when we put in the remainder of the muck-heap, 'washed, dried, and mangled,' by the road side." The management of manure was a positive national and individual waste and loss; it was the very essence of losing money. He knew there were some practical difficulties in carrying out the plan; he knew that the landlords would not find troughing very often; but he did think that public attention should be drawn to the subject; it was quite clear the principal object of the farmer now was by very expensive means to get the best manure to force remunerative crops: therefore, that these very means should be sacrificed by mismanagement was a great national calamity—he believed there were but few farmers who had sold beasts lately, who were not aware of the cost of producing manure for their Wheat crops.

Miscellaneous.

Mr. Smith, of Deanston.—We are sorry to have to announce the sudden death of James Smith, of Deanston, the eminent agriculturist. He was found dead in bed on Monday last, at the house of his cousin, Mr. Buchanan, Catrine, Ayrshire. Perhaps in our day there is no man to whom agriculture owes so much. He was acknowledged by all agriculturists to have been the inventor and chief promoter of the modern system of thorough drainage—that is, the drainage through the land by pipe drains, instead of over the land by surface drains. He had been engaged in the direction of extensive works of land drainage. He had acted as one of the commissioners for inquiring into the means of improving the health of towns, and had pursued that subject with so much energy that his health suffered from it. Latterly he had been engaged as one of the superintending inspectors of the General Board of Health, by whom his exertions were more especially directed to the application of the sewage water and refuse of towns to agricultural production. He was

a man noted for his fertility of invention, and a very high order of ability. He was personally highly esteemed by those who served under him, as well as by those who served with him, by whom he will be greatly lamented. *From the Times, June* 12.

Experiments on the Application of Guano and other Manures, in the Duke of Somerset's Park at Stover, near Newton Abbot, Devon. By E. S. Bearne.—No. 1. Report of an experiment to test the comparative efficiency of five different kinds of artificial manure in improving pond mud, the experiment being made on an acre of inferior pasture land in Stover Park, in the years 1847, 1848, and 1849. The land on which the experiment was conducted is of uniform quality, the soil being a light, sandy loam, a few inches in depth, incumbent on a stratum of white clay. The land underwent thorough draining in 1844, prior to which it would not produce a rent of more than 5*s.* an acre. No manures were applied to the land in 1848 or 1849. The object sought to be attained by extending the experiment over a period of three years was to test the durability of the different manures.

No.	Manures applied in 1847.	Weight of hay cut in 1847.	Weight of hay cut in 1848.	Weight of hay cut in 1849.	Weight cut per acre in 1847.	Weight cut per acre in 1848.	Weight cut per acre in 1849.	Cost of the Manures.

N.B.—The after-grass in 1847 was stocked with sheep, but in 1848 it was left unconsumed.

No. 2. Report of an experiment made with the undermentioned manures on an acre of pasture land in Stover Park, in the year 1849. The manures, when mixed with a small quantity of fine earth, were applied broadcast on March 29th, and during the rainy weather which prevailed at the time. The land is of a fair average quality, and was formerly used as tillage land, but has been in pasture for many years. The crops were mown on 22d June, and the herbage produced by the different manures was of a superior quality.

E. S. Bearne, in the 10th vol. of the Eng. Ag. Journal.

Calendar of Operations.

JUNE.

East Lincolnshire Farm, *June* 10.—The time for Turnip sowing has now again recurred with a favourable season. We have just commenced with early Purple-top Whites, drilling them at the distance of 18 inches apart. The land is both of good quality and in fine tilth; we grow splendid crops of Turnips without going to the expensive assistance of artificial manures, but, as I before mentioned in a former report, we lay on our farm-yard dressing in winter: in the spring we plough the land back, harrow, roll, and thoroughly cleanse from weeds, finishing with a third ploughing before sowing. Swedes we do not grow, as they are not so much required here, because we do not on the Wolds graze many beasts, but merely keeping them in the yards during winter to make manure (with an allowance of cake), to sell off in the spring, when they go down to the marshes to be finished off. The pastures are now fast improving with the late fine showers; our other occupations have been threshing out the Wheat remaining in the stack-yard by steam-power, which saves the horses this hot weather, and also enables them to proceed with the farm work without interruption. I will just add, in conclusion, a few lines with reference to the "*Times* Commissioners' Report" last month of the system of farming pursued on the Lincolnshire Wolds. With regard to sheep, it is mentioned that they are generally grazed off at two years, whereas in many cases, on this farm for example, we sell them off as shearlings (or as hogs), having been caked through the winter on Turnips, which brings us to another point touched on by the Commissioners, where it is stated that oilcake is never given to the sheep on Turnips, but only to ewes on seeds with twin lambs. Now we give it to all the sheep on Turnips, and continue it to the hogs after they are turned to Grass, and this system is invariably pursued on all the large holdings in the neighbourhood. The fact is, that true reports of the farming of different counties, and of districts in those counties, can only be obtained by a residence of some time in the country, and not by mere visits through, where very often the best districts are missed. *H. E.*

Lammermuir Sheep Farm, *June* 3.—The 6th of May, 1850, will long be remembered in this district, as the "late snow-storm." The oldest people we have asked—some of them bordering on four-score—never remember such a heavy fall of snow, accompanied with severe drift, so late in the season. The face of some wreaths was above 6 feet deep. The average fall in our hills was about 8 inches, while on the Roxburgh hills it was about 18. Appearances being no worse on the 5th, than for some time previous, the shepherds had made no provision for what was coming, by putting the sheep into shelter; the consequence was, that they scattered up and down in every direction. In the morning most of the lambs being very young it was impossible to move them in the drift. At first it was the care of the shepherds to look after those dropped the previous night, but matters soon got so serious that their anxiety was directed to the saving of the old sheep. Had the storm continued much longer than it did, the consequences must have been very severe, but fortunately it abated about mid-day. Our loss was very trifling, and arose from the lambs falling into pasture drains, drifted level with the general surface, and as the snow quickly melted under a May sun, unless relieved, they were speedily drowned. Though the actual loss is very small, yet the effects of the cold and want of Grass in putting the milk off the ewes, is still to be seen on the lambs, which, in most cases, want that blooming appearance which is desirable. However, the weather is hot enough now (70° in the shade), and Grass, though late, is coming abundantly. The lambing is now finished, and except a few of the youngest, all are castrated and docked. We purpose shearing the rams in the course of two or three days, but two or three weeks will elapse before the regular work commences. At present all the attention of the shepherds is necessary to prevent loss from rolling, the heat being great, and the nature of the ground unfavourable. Turnip sowing was completed yesterday; the greater part are now brairded, and looking well. The cutting of peat, carting out of any manure made during the past month, getting things in readiness for sheep-shearing, and other odd jobs, will occupy our attention for some time. The thermometer during May has been 37°, 55°, and 37°, morning, noon, and evening respectively. *A Lammermuir Farmer.*

Notices to Correspondents.

A Country Curate's Garden: *A Well Wisher* agrees with "J.F." as to the desirability of keeping a cow, and would advise also a pig; but animals, like bipeds, must have a change in diet to keep them in health. He would therefore suggest, in addition to Mangold Wurzel, that Swedes, Dale's Hybrid Turnip, Lucerne, and Clover be grown, and that a portion of the two latter be made into hay for winter use.

Butter: *Inquirer.* Milk butter contains more cheese than that made from cream, and is therefore not so capable of being kept. We cannot explain the singular instances which do sometimes occur with churns of all constructions—American or otherwise—in which no butter comes after hours of churning. Can any one suggest an explanation.—We do not know Cooper's Rye-grass. Can any one say whether it is earlier for cutting than other sorts.

Gorse: *T M'C.* Hack the land over, and sow 8 lbs. of the seed per acre in shallow drills, 18 inches apart, early in April. It would probably answer very well in the situation you allude to—unless it is exposed to severe frosts, which will kill it.

Hybrid of Hen and Pheasant: *J.* We do not know Mr. Warren's address.

Implements: *W Islam.* Your recommendation of the firm you name amounts to an advertisement.

Officer: *Tyro.* What are the duties of a "ground officer" in Scotland?

Oyster-shells: *J L.* Certainly they are worth having. Crushed oyster-shells, or calcined oyster-shells, are more powerful than lime.

Pasture: *Amateur Farmer.* In the case of a small farm, we should prefer applying manure during the last winter's frosts. When there is a large extent to be manured, it is unsafe to depend upon having a sufficiently long period of frost during which the carts may go on the land without poaching it, and therefore in such a case you must adopt the practice of manuring after hay harvest when the ground is dry.

Pigeons: *Ballandyne.* Are you sure that you have 50 *pairs?* we should doubt your having that number of hen birds.

Reports of the State of Agriculture in New York: *Inquirer.* Possibly your bookseller might procure you the necessary information. The work itself is published by Dutton and Wentworth, Boston, U.S.

Markets.

COVENT GARDEN, June 15.

Vegetables are abundantly supplied. Strawberries and Hot-house Grapes are both plentiful, and the same may be said of Pine-apples. The supply of Peaches and Nectarines has greatly increased, and they are, in consequence, cheaper. Walnuts and Chestnuts are abundant; Oranges and Lemons sufficient for the demand. Young Carrots and Turnips may be had at from 6d. to 9d. a bunch. Frame Potatoes fetch from 6d. to 8d. per lb. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, and Rhubarb are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Cinerarias, Lily of the Valley, Pinks, Carnations, Rhododendrons, Ranunculuses, and Roses.

POTATOES.—Southwark, June 10.

The Committee report that the supply of English Potatoes is nearly finished for this season, but the supply from the Continent is quite equal to the demand. The following are this day's quotations:—York Regents, 100s. to 160s. per ton; Scotch cups, 70s. to 80s.; ditto whites, 50s. to 60s.; Rhenish do., 75s. to 85s.; Belgian do., 60s. to 70s.

HAY.—Per Load of 36 Trusses.

Smithfield, June 13.

Prime Meadow Hay	70s	to 75s	Clover	68s	to 84s
Inferior ditto... ...	55	65	New Clover	—	—
Rowen	54	60	Straw	23	28
New Hay	—	—		J. Cooper.	

The trade very dull.

Whitechapel, June 13.

Inferior ditto ...	55	60	Inferior ditto... ...	65	70
New Hay	—	—	Straw	22	26
Old Clover	80	84			

HOPS.—Friday, June 14.

Messrs. Pattenden and Smith report that there is a steady trade doing in new and fine yearling Hops at late prices. There is no increase of fly in the plantations.

SMITHFIELD, Monday, June 10.

The supply of Beasts is moderate and demand good; consequently Friday's quotations are well supported, and in some instances choice Scots have reached 3s. 8d. The number of Sheep and Lambs is a fair average; the former are selling rather dearer, the latter about the same as of late. Trade is exceedingly dull for Calves, at about the rates of Friday last. From Holland and Germany there are 280 Beasts, 1010 Sheep, and 142 Calves; from Scotland, 120 Beasts; and 2800 from Norfolk and Suffolk.

Per st. of 8 lbs.—s d	s d	Per st. of 8 lbs.—s d	s d

		Pigs	2 8 — 3 8

Beasts, 3385; Sheep and Lambs, 27,200; Calves, 289; Pigs, 320.

Friday, June 14.

We have a large supply of Beasts, consequently trade is heavy, and prices are lower on the average. Only the choicest Scots reach our top quotations. The number of Sheep and Lambs has considerably increased. They cannot be all sold, although there is a disposition to take lower prices. We have far too many Calves for the demand. Our top quotation is only obtained for very good quality. Several second-rate remain unsold. From Germany and Holland there are 205 Beasts, 530 Sheep, and 152 Calves; and 121 Milch Cows from the home counties.

Eden Main, 14s.; West Hartley, 14s.; Wallsend Braddyll's Hetton, 15s. 6d.; Wallsend Haswell, 16s.; Wallsend Hetton, 16s.; Wallsend Lambton, 15s. 6d.; Wallsend Stewart's, 16s.; Walsend Tees, 16s.—Ships at market, 116.

MARK LANE.

Monday, June 10.—The supply of English Wheat to this morning's market was small, and the red was taken off early in the morning at rather over the terms of this day se'nnight. This, combined with the accounts from the country markets, and the quality of the white being generally fine, induced factors to hold for more money, which checked business, and the sales subsequently became dull, leaving a large proportion undisposed of towards the close. For foreign the demand was very inanimate, and a difficulty would have been experienced in forcing the sale of a quantity of Dantzic at a reduction of 1s. to 2s. per qr. from our quotations of Monday last.—Barley, Beans, and Peas are unaltered in value.—The Oat trade is firm, and fine qualities being scarce command rather more money.

Friday, June 14.—The arrivals of English corn this week have been moderate, of foreign Wheat large. This morning's market was moderately attended; the English Wheat left over from Monday was disposed of at a decline of 1s. per qr. upon the prices of that day week. Foreign was difficult of sale, and for out of conditioned cargoes it was impossible to find buyers.—We observe no alteration in the value of Barley, Beans, or Peas.—The majority of Oats fresh up are in bad order, and very unsaleable; fine qualities are sought after at former prices.—Flour is more easy of sale, and generally held for a slight advance.—There are buyers of Galatz Maize at 29s., cost, freight, and insurance, but holders generally demand 1s. more money.

Liverpool, Friday, June 14.—At our market to-day the Wheat trade exhibiting a rather better feeling, our home millers operated to a moderate amount, and being aided by a few speculative inquiries, the small decline of Tuesday was pretty nearly if not fully recovered. Barley, Malt, Beans, and Peas, upon a slow gradual demand, merely sustained the last quotations. Oats and Oatmeal met a limited demand, but maintained former prices. The Irish millers being inclined to use up their stocks of Indian Corn, bought sparingly this morning at a reduction of 1s. per qr.

TO NOBLEMEN, GENTLEMEN, AMATEURS, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed to sell by public Auction on the premises, Rosary, Breadmore, Hammersmith, on MONDAY next, June 17th, and TUESDAY, the 18th, 1850, at 12 o'clock, each day, by order of the trustees of H. G. Hannington, Esq., three newly-erected Greenhouses, about 100 capital one, two, and three-light Boxes, Hand-lights, two Iron Rollers, Barrow, Seakale and other Pots, 100 Avenue Irons for climbers, 12 Hives of Bees, a large quantity of Chinese Figures, Vases, and Statues, 150 Fancy and other Rabbits, 100 Pigeons and Houses, 40 Doves; a fine assortment of fancy Poultry, Spanish and other breed; Store and Guinea Pigs; 13 large Zinc Store Canisters, three Garden Engines, 60 Mats; together with the selected Stock of Greenhouse Plants, 200 doz. of German Miniature Plants in pots, 15 gross of handsome German Pots, and sundry effects.—May be viewed two days prior to the Sale. Catalogues may be obtained (6*d.* each, returnable to purchasers, without which no person can be admitted) on the premises of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone.

WINDING UP SALE FOR THE SEASON.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on FRIDAY, June 21, 1850, at 12 o'clock, a first-rate Collection of DAHLIAS, also the newest varieties of Fuchsias, Verbenas, Geraniums, Heartsease, and other plants in bloom, together with a variety of Ornamental Plants for bedding.—May be viewed the morning of Sale; Catalogues had at the Mart, and of the Auctioneers, Leytonstone.

EVENLEY RECTORY FARM,
NEAR BRACKLEY, NORTHAMPTONSHIRE—600 ACRES.

TO BE LET, the above eligible TURNIP and SHEEP FARM, for a term of years, from Michaelmas next.—Apply to Messrs. PICKERING and SMITH, 14, Whitehall-place, London.

DR. S. NEWINGTON'S HAND-DRILL HOES AND CULTIVATORS, to the frames of which are fitted Coulters for earthing up Potatoes and drawing out furrows for seeds. The chisel-pointed tines have moveable hoeing shares fitted to them, which can be removed when the tines are only required for stirring. These shares, which are made of any required width, hoe from 2 to 4 inches below the surface, according to the soil; on the shares being removed, the tines stir from 5 to 6 inches deep, a lad being enabled to hoe 2 acres of Turnips, &c., daily, cutting off every weed, and setting out the plants, reducing the price of labour from 4*s.* to 8*d.* an acre, or being able to hoe the crop six times, and much more effectually, for the same money now paid for hand-hoeing. Messrs. DUFAUR and Co. will exhibit, at the Royal Agricultural Show at Exeter, the following implements invented by Dr. NEWINGTON: A Drop Drill for horse power; the same for hand power; an implement to supersede broadcasting seed by hand, for horse power; the same by hand power; an implement for broadcasting artificial manures or depositing it in rows by horse power; the same by hand power; a horse Dibble; a hand wheel Dibble; a subsoil Plough; a Scarifier or Cultivator; a paring Plough; a single horse Plough; hand drill Hoe and Cultivators, with various other fittings; a strike Plough —Apply to Messrs. DUFAUR and Co., 21, Red Lion-square London, who are the sole manufacturers and vendors of Dr. NEWINGTON'S inventions.

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6*s.* per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7*s.* 9*d.* a set. Sword-scrapers for Gardens, 1*s.* 2*d.* each. Patent Fumigators for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. BOOBBYER and Co.'s (late STURCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

The terms of the School can be had on application either personally or by letter.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	¼ in.	⅜ in.	½ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s.* 5*d.*	0*s.* 6*d.*	0*s.* 8*d.*	0*s* 10*d.*	1*s.* 0*d.*	1*s.* 2*d.*	1*s.* 4*d.*	1*s.* 6*d.*
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

IRON AND WIRE FENCING,
AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS,
252, OXFORD-STREET (NEAR HYDE PARK),
And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of
PLAIN AND ORNAMENTAL IRON AND WIRE FENCING,
Park Entrance, Carriage and Field Gates, Wickets, &c.;
Deer, Sheep, and other Hurdles;
Hare and Rabbit-proof Wire Fencing;
Iron Bedstead Makers to the Board of Ordnance;
And Government Contractors.

The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility, and on the most moderate terms. Drawings made and estimates prepared, if required. The showrooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND: GLASGOW SHOW.—Stock, Implements, &c., to be exhibited at GLASGOW, must be entered with the Secretary not later than the 20th inst.

6, Albyn-place, Edinburgh, June 15. J. HALL MAXWELL, Secretary.

TO NOBLEMEN, LANDED PROPRIETORS, AGRICULTURISTS, ENGINEERS, CONTRACTORS, AND OTHERS.

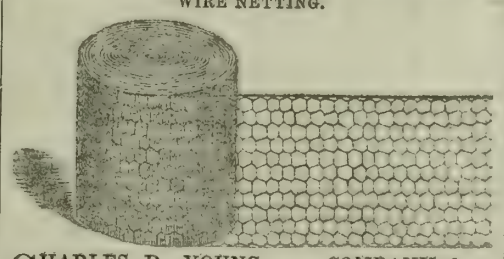
THE PATENT ALKALI COMPANY'S Metallic Black, Bright-red, and Purple-brown PAINTS are applicable for covering iron and wood work of every description, also stuccoed and brick buildings, and are remarkable for their superior preserving properties, cheapness, and durability.—Offices of the Company, 1, New Broad-street, London.

JOHN A. WEST, Secretary.

HYDRAULIC ENGINES, WATER RAMS, &c., on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.
Direct to JOHN LEGG, Cheltenham.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.
Works, Sumner-street, Southwark-bridge-road.

ENORMOUS SAVING! GOING WITH THE TIMES!



HOW TO KEEP A HORSE for less than ONE SHILLING per DAY. The articles and numerous references may be seen, and a list of prices had at MARY WEDLAKE and Co.'s, 118, Fenchurch-street. A Pamphlet on the above may be had, each (post free) 1*s.* Also
HOW TO MAKE, Cut, Cart, and Stack HAY, for less than HALF the usual cost, in any county and in any weather.—N.B. A Pamphlet on the above may be had, each (post free) 1*s.*

A BOON TO THE FARMERS.

FARMERS, be of good cheer, all is not yet lost.
Come to us, you will find us ready to meet the times!
As you cannot get the same price for your produce, so we cannot expect from you the same price for our IMPLEMENTS, and without first-class manufactured Implements you cannot stand these times! By inclosing two stamps, a list, with illustrations, will be forwarded. Real makers of what they sell.—Most liberal discount for cash.

PORT NATAL, NEW ZEALAND, AUSTRALIA.
Emigrants are informed MARY WEDLAKE and Co. have from time to time supplied the first settlers to Swan River and Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS, and tools of first-rate class. They beg an inspection of their stock.—N.B. Purchasers may have the benefit of an introduction. Most liberal discount for cash.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
22, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;
beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

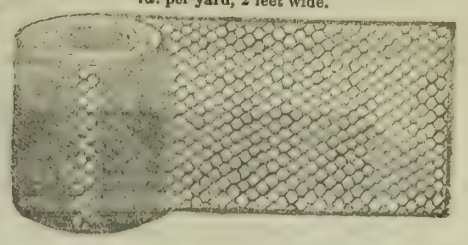
This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3 15	0
Do. of 100 yards, 24 ins. wide	..	5 0	0
Do. of 100 yards, 30 ins. wide	..	6 5	0
Do. of 100 yards, 36 ins. wide	..	7 10	0

If more or less than a web is required, it would be charged at the same rate per yard.



This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2¼ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.
Workmen sent to all parts of Scotland, England, and Ireland

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7*d.* per yd.	5*d.* per yd.
2-inch „ strong „	...	9 „	6½ „
2-inch „ extra strong „	...	12 „	9 „
1⅝-inch „ light „	...	8 „	6 „
1⅝-inch „ strong „	...	10 „	8 „
1⅝-inch „ extra strong „	...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3*d.* per yard		30 inches wide	7½*d.* per yard	
18 „	„ 4½*d.*	„	36 „	„ 9*d.*	„
14 „	„ 6*d.*	„	48 „	„ 1*s.*	„

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards, Wire House Lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each; Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

PROFESSOR LINDLEY'S INTRODUCTION TO BOTANY, 4th Edition, with Corrections and Additions, now ready, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24*s.* cloth.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

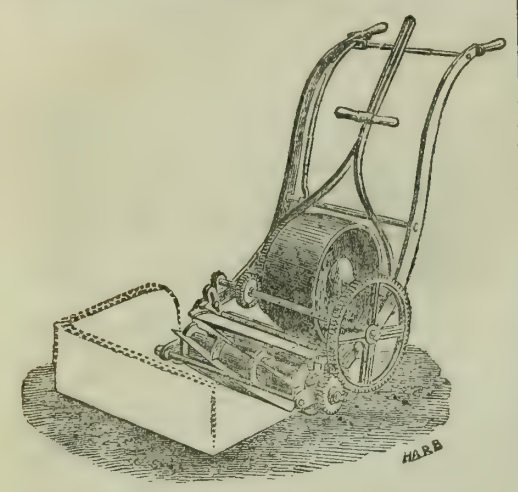
Applications to be addressed to Mr. DAVIS, Accountant, Bishopsgate Station. By order, C. P. RONEY, Secretary.
Bishopsgate Station, June 15.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.



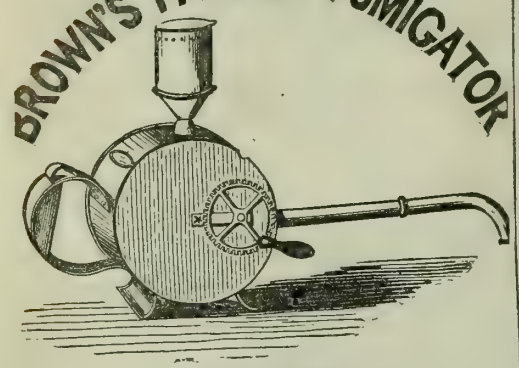
Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

BUDDING'S PATENT MOWING MACHINE.



This Machine may be worked by persons who cannot use a Scythe. It may be adjusted to cut any length, and leaves a more even surface than can be produced by the most skilful mower. The Grass may be cut when dry, and may be collected in the box, which enables the gardener to cut his lawns at the most convenient time, and renders sweeping afterwards unnecessary, while with the same amount of labour more than double the quantity of work can be done than with a scythe. Various sizes are made both for manual and horse power, and the prices have this year been reduced to the lowest possible scale. There are now between 3000 and 4000 of these Machines in use.

Manufactured and sold by JOHN FERRABEE and SONS, Phœnix Iron Works, near Stroud, Gloucestershire.

GENERAL WHOLESALE AGENTS.—Messrs. Ransomes and May, Ipswich.

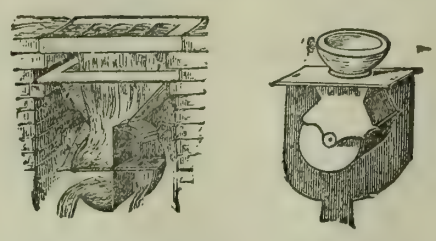
AGENTS.—Messrs. Mapplebeck & Lowe, Bull Ring, Birmingham; Messrs. Lister and Lees, Cateaton-street, Manchester; Mr. Wm. Drury, Castle-street, Liverpool; Messrs. J. Nelson and Sons, 47, Briggate, Leeds; Mr. T. Johnson, Leicester; Messrs. Stratton, Hughes, and Co., Clarke-street, Bristol.

BROWN'S PATENT FUMIGATOR

RAT RIDDANCE.
GENERAL VERMIN EXTERMINATOR.

IN addition to its multifarious uses for Horticultural purposes, Disinfecting Rooms, or Closets, Smoking Apiaries, &c., &c., BROWN'S PATENT FUMIGATOR has been successfully applied to the extirpation of rats, beetles, bugs, moths, and other vermin, by injecting suffocating vapour or smoke into their haunts. Instead of tobacco (used for fumigating plants), moss mixed with a small quantity of flower of sulphur may in some cases be substituted, and the nozzle of the instrument introduced into the haunts of the vermin.

BROWN'S FUMIGATOR is applicable to so many purposes, in and out of doors, as to have now become indispensable in every family. Price 10*s.* and upwards. Manufactured and supplied to the trade by Messrs. BARBER and GROOM, London.



For further particulars see *Gardeners' Chronicle* of May 25.

Sold by all Ironmongers, Seedsmen, and Florists.

PIGEONS. — FOR SALE, Fancy, Short-faced, Almonds; rich Kites, golden Duns, yellow and red Agates, soft feather cream-colour all bred from Almonds; yellow, red, and black Mottles, mottle-bred, all Tumblers; young, healthy, hardy birds, bred from as good and pure a stud of birds for the five properties as any in the kingdom, regardless of expense; the breeder having selected a few for his own stud. Each bird can be had separately, giving members of columbarian societies, amateur fanciers, and others about to commence this truly delightful, innocent, rational amusement or fancy, such an opportunity as seldom occurs of matching up and crossing their strain. Communication, by prepaid letter, addressed to the breeder, J. M. E., 7, Islington-green, London.

N.B. The Birds can be forwarded in small baskets per rail in perfect safety.

TO BUILDERS, &c.
IMPORTANT SANITARY INVENTION.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

C. MARSDEN'S ROTARY WATER-CLOSETS and EFFLUVIA TRAPS, acknowledged by the most scientific to be the best and simplest self-acting Water-Closets and Effluvia Traps ever invented. A stench arises at the time of using all other Water-Closets—with this invention it can be got rid of. It is constructed in the shape of a drum, with four receivers or buckets caused to revolve by the weight of the matters falling into one of the receivers, when it instantly empties itself into the drain or sewer, and another bucket is ready from the opposite side to take its place, and two others on their ascent, to be emptied in their turn, while any upward escape of effluvia during these successive changes is effectually prevented, by overhanging and side flaps of vulcanised India-rubber, so placed that it is impossible to get choked up or get out of order; no balance weight or handles, no D or syphon traps required with these Closets. All traps that require water to keep them air-tight must necessarily leave a sediment to putrify. The value cannot be believed unless seen and tested.—Also Manufacturer of Decorative Marble Paper-hanging.—Waterloo House, Kingsland-road, near the Bridge.

THE SUMMER RIDE OR PROMENADE.—The peculiar virtues of C. and A. OLDRIDGE'S BALM OF COLUMBIA completely remove the difficulty experienced by Ladies in preserving their ringlets after exercise; its use so invigorates the hair, that tresses, previously the straightest and most destitute of curl, rapidly acquire a vigour which maintains in permanent ringlets the head-dress of the most persevering votary of the ball-room, the ride, or the promenade. After the Minerals and Vegetables of the Old World have been compounded in all imaginable ways in fruitless attempts to discover so important a desideratum, we are indebted to the Western Hemisphere for furnishing the basis of

OLDRIDGE'S BALM OF COLUMBIA,

the efficacy of which in preserving, strengthening, and renewing the hair has become a matter of notoriety among all civilised nations. Its restorative virtues are indeed a proverb, and the most satisfactory attestations to its infallibility in reproducing hair upon persons otherwise hopelessly bald, have been published from time to time by the Proprietors, 13, Wellington-street North, Strand, a few doors above the Lyceum Theatre on the opposite side.

3*s.* 6*d.*, 6*s.*, and 11*s.* per Bottle; no other prices are genuine. When you ask for "Oldridge's Balm," never let the shopkeepers persuade you to buy any other article as a substitute.

EMIGRATION TO AUSTRALIA.
New Line of Packets from Liverpool.
SALACIA...1200 tons, to sail about June 30.
PETREL ...1200 " " " Aug. 30.
CONDOR...1500 " " " Oct. 30.
A 1 New Ships, coppered and copper fastened.—For freight or passage apply to the owners,
GIBBS, BRIGHT, and Co., Liverpool.

DEAFNESS.—New Discovery.—THE ORGANIC VIBRATOR, an extraordinarily powerful, small, newly-invented instrument, for deafness, entirely different from all others, to surpass anything of the kind that has been, or probably ever can be, produced. It is modelled to the ear, so that it rests within, without projecting. Being of the same colour as the skin, it is not perceptible. Enables deaf persons to enjoy general conversation, to hear distinctly at church and at public assemblies. The unpleasant sensation of singing noises in the ears is entirely removed, and it affords all the assistance that possibly could be desired. Also, invaluable newly-invented SPECTACLES.—S. and B. SOLOMONS, Aurists and Opticians, 39, Albemarle-street, Piccadilly, London.

OLD FEATHER BEDS RE-DRESSED, AND PURIFIED BY STEAM WITH PATENT MACHINERY.—This new process of dressing not only removes all impurities, but by expanding the feathers the bulk is greatly increased, and consequently the bed rendered much fuller and softer.—Charge for dressing, 3*d.* per lb. Old and Mothy Mattresses effectually cured and removed, fetched and returned, carriage free, within five miles.—HEAL and SON'S List of Bedding, containing full particulars of weights, sizes, and prices, sent free by post on application to their factory, 196 (opposite the chapel), Tottenham-court-road, London.

A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being at once a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sun-burn, Redness, &c., and by its balsamic and healing qualities, render the skin soft, pliable, and free from dryness, scurf, &c., clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

AN AFTERNOON'S TRIP TO INDIA.

THE LADIES' COMPANION, for June 15, contains an Illustrated Route to India.—Graphiology, with numerous Fac-similes of the Signatures of Celebrated Characters. — Helen Fairfax, concluded. — The British Insects of Spring, with Illustrations.—Household Hints and Receipts, by Miss ACTON.—The Work-Basket, with Illustrations, &c.

Published Weekly, price 3*d.*, stamped 4*d.*, and in Monthly Parts, 1*s.* 2*d.* each. Parts 1 to 5 may now be had.

THE FIRST VOLUME WILL BE PUBLISHED EARLY IN JULY, ELEGANTLY BOUND.

Office, 11, Bouverie-street, and all Booksellers and Newsmen.

Just published, price 1*s.* 6*d.*,

WATERER'S SYSTEM OF GROWING THE RHODODENDRON, AZALEA, KALMIA, and other Flowering American Plants; with Observations on Laying-out, Planting, and Improving Estates, including a few Remarks on Improving the Condition of the Agricultural Labourer.

By W. B. M'PHERSON, Landscape Gardener.

London: SIMPKIN, MARSHALL, and Co., Stationers'-hall-court.

HANDSWORTH AND LOZELLS FLORAL AND HORTICULTURAL SOCIETY.

The SECOND EXHIBITION this Season will (by the kind permission of JOSEPH BARROWS, Esq.), be held at Handsworth Hall on TUESDAY next, June 25th. By permission of Colonel the Hon. A. A. Dalzell and the Officers of the 48th Regiment, the celebrated Band, consisting of 30 performers, from the Military Station at Weedon, will attend. In addition to an extensive List of Prizes, the following will be awarded, open to all England:

Five Pounds for the best Six GERANIUMS.
Three Pounds for the second-best ditto.
Two Pounds for the third-best ditto.

Competitors for these Prizes will be charged Five Shillings entrance money for each collection, the proceeds of which will be awarded to the Exhibitor of the best Seedling Geraniums. It is requested that intending Exhibitors for these Prizes give notice to the Secretary on or before the 21st inst. All Vans, &c., containing Specimens for Exhibition must enter the Grounds through the Gate in the Old Walsall-road. The Gates will be open to the Public on this occasion from Two until Eight o'clock. Admission, One Shilling. C. J. PERRY, Hon. Sec.

Hamstead-road, June 22.

MESSRS. J. AND H. BROWN offer the following Choice Plants, which they will forward to any part.

The best varieties of Antirrhinums, Verbenas, Petunias, Salvias, Pentstemons, Anagallis, Bouvardias, Heliotropiums, Calceolarias, Lobelias, Cupheas, Torenias, Plumbago Larpentæ, Zauschneria Californica, Scarlet Geraniums, &c.; all at 4*s.* per dozen, and at a further reduced price if taken in large quantities.

25 Fuchsias of the newest and best varieties for	10*s* 0*d*
Fancy Geraniums, of best sorts, per dozen	9 0
Chrysanthemums, fine new varieties, per dozen	6 0
Ditto, Lilliputian, 12 varieties, free by post	10 0
Roses, and other Climbers of choice sorts, in pots, per doz.	6 0
12 Azalea Indica, splendid varieties	25 0
50 Select Greenhouse plants, one of a sort, by name	40 0
24 Choice Ericas, one of a sort, by name	18 0
12 Gloxinias, superior new sorts	8 0
12 Achimenes, in beautiful new varieties	10 0
12 Begonias, one of a sort, by name, for	8 0
Orchidaceous Plants, 12 fine species	30 0
12 Tea-scented Roses, one of a sort, by name, in pots	9 0
Passifloras and Clematis, hardy and tender species, each	1 6
12 Hardy Ferns, and other Rock plants	8 0
German Miniature Plants and Ferns for glass cases, per dozen	6 0

All new plants supplied as figured in the various periodicals. Descriptive Priced Catalogues sent by post for 6 stamps.

Albion Nursery, Stoke Newington, London, June 22.

CHOICE CINERARIA SEED.

LUCOMBE, PINCE, AND Co. have saved from a select collection of all the newest and finest varieties of 1850, which they have this season grown in great perfection, some Cineraria Seed of excellent quality, and they beg leave to offer it for sale in packets, sealed and warranted by them at 2*s.* 6*d.* and 5*s.* each, free by post; if sown soon strong plants will be produced, which will flower early in 1851.

Exeter Nursery, June 22.

BEAUTIFUL NEW HARDY HERBACEOUS PLANT, PENTSTEMON CYANANTHUS.

LUCOMBE, PINCE, AND CO., in calling public attention to this truly beautiful Hardy Plant, feel convinced they are fully justified in asserting that

PENTSTEMON CYANANTHUS

is decidedly one of the finest Hardy Herbaceous Plants ever introduced. Its dwarf compact habit, profuseness of flowering, brilliance of colour (a bright azure blue corolla, with a purplish tube), and neat glossy evergreen foliage, cannot fail to give satisfaction to all who cultivate it. A specimen was sent by L., P., and Co. to Sir WILLIAM HOOKER, who deemed it worthy of being figured in the "Botanical Magazine" for September last, and who thus speaks of it:

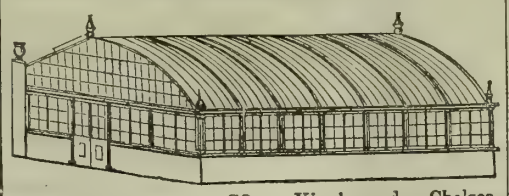
"A more beautiful Pentstemon even than that we have figured at Tab. 4319, having equally handsome flowers, and these much more numerous and more compact, forming a spike (as in a specimen now before us) more than a foot long, and with much finer foliage. It is, too, an inhabitant of the same country—the upper valley of the Platte River, in the Rocky Mountains, where seeds were collected by Mr. Burke; these seeds were raised by Messrs. LUCOMBE, PINCE, and Co., in whose Exeter Nursery the plants flowered beautifully in the open air in May, 1849. The species is doubtless quite hardy, and a great acquisition to our flower borders; a bed filled with this species would have a splendid effect. It may rank near P. acuminatum, Dougl. (in Bot. Reg. t. 1285), but is quite different, and infinitely more beautiful."

Fine healthy plants will be ready on the 15th July next, at 21*s.* each, an allowance to the trade; when two are ordered three will be sent.

Exeter Nursery, June 22.

ROSE ADMIRERS are respectfully informed that A. PAUL and SON'S large collection is now in bloom, and will be in full beauty in a few days. Conveyance from London, by the Eastern Counties Railway, from Bishopsgate station to Cheshunt station, one mile from, and Waltham Cross station two miles from the Nurseries. An omnibus plies from the latter station.—Cheshunt Nurseries, June 22.

HALLIMAN'S REGISTERED FRUIT PROTECTOR.—This Glass placed over Fruit on the common wall (sooner the better) assists Nature, in our cold climate. The Fruit grows to a larger size, and its richness is increased. All orders C. H. is favoured with will be forwarded with printed directions for use, at the lowest possible price, for ready money. Flint Glass, 4 inches, for Peaches, 9*s.* per dozen, 3*l.* 10*s.* per 100; 6 inches, for Grapes, 13*s.* per dozen, 5*l.* per 100.—C. HALLIMAN, 1, Queen's-place, Norland-square, Kensington, London. To be had of all Nurserymen and Seedsmen.



DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

G. and J. DEANE are Sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.—DEANE'S Horticultural Tool Warehouse, opening to the Monument, 46, King William-st., London-bridge.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

TO LADIES AND OTHERS INTERESTED IN HORTICULTURE.

THE STRAWBERRY.—An eminent Medical Writer thus notices the properties of the Strawberry:—"The act of eating this fruit cleanses the teeth and gums, and purifies the breath: it assists digestion, fortifies the stomach, and being entirely soluble never turns sour or undergoes fermentation. In many cases it is positively medicinal, removing rheumatic affections, and other diseases arising from obstruction of the system."

How essential therefore it is to cultivate such fruit in perfection! Those who are desirous of so doing should apply to Mr. JOHN ROBERTS, of 34, Eastcheap, London, who has recently published a pamphlet on the cultivation of this delicious fruit, together with many other fruits and vegetables, which may be obtained by enclosing three postage stamps, addressed to him as above.

HARTLEY'S PATENT ROUGH PLATE GLASS.

JAMES PHILLIPS AND CO., 116, Bishopsgate-street Without, beg to hand their list of Prices of the above description of GLASS. Cut to order in panes of

8 by 6	and under	10 by 8	at 4½*d.*	per foot.
10 by 8	,,	14 by 10	at 5*d.*	,,
14 by 10	,,	1½ foot, or sizes not exceeding 20 inches long	at 5½*d.*	,,
1½ foot	,,	3 feet, or sizes not exceeding 30 inches long ...	at 6*d.*	,,

PACKED IN BOXES OF 50 feet each.

6 by 4 and 6½ by 4½...10*s.* 6*d.* 8 by 6 and 8½ by 6½...13*s.* 6*d.*
7 by 5 and 7½ by 5½...12*s.* 0*d.* 9 by 7 and 10 by 8 ...15*s.* 0*d.*

We do not pledge ourselves to execute large orders for small squares at the above prices, but only as far as they turn up in cutting. Should any quantity of small squares be required, a special contract is necessary.

MILK PANS 2*s.* to 6*s.* each, Metal Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Wasp Traps, 3*s.* 6*d.* per dozen; Pastry Slabs, Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7*s.* 6*d*; 6 tubes, 10*s.* Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

From the *Gardeners' Chronicle*, December 8, 1849:

"As for the article substituted for Rough Plate, and which is actually in the market for the purpose of imposing upon gardeners, it is wholly unfit for any horticultural purpose. The best samples of it which we have yet seen is sold by Mr. JAMES PHILLIPS, 116, BISHOPSGATE STREET, LONDON."

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s.* to 5*s.* each. Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s.* 6*d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

GLASS WATER PIPES.

MESSRS. COATHUPES AND Co., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ½-inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

A FARM HOUSE, AND TWENTY-SIX ACRES OF LAND TO BE LET (entry at Michaelmas next), at Tempsford, Bedfordshire, by St. Neot's, a compact, commodious FARM HOUSE, situate a little off the Great North-road, with very convenient Out-buildings, in good repair; a new Bake-house, a productive Garden, 22 acres of MEADOW LAND (now put up for Hay), and 4 acres of ARABLE LAND. If desired, perhaps the House might be had without the Land.—Apply by letter (prepaid) to GEORGE PEPPERCORN, Esq., care of H. C., Tempsford, by St. Neot's, Huntingdonshire. Satisfactory references will be required.

Mr. Hunter, Gardener to — Clifton, Esq., Cross-street, Islington, for three Cucumbers.

BRONZE MEDAL.

To Mr. Bruce, Gardener to Boyd Miller, Esq., Collyer's-wood, Lower Tooting, for 10 Stove and Greenhouse Plants
To Mr. Stanly, Gardener to H. Berens, Esq., Sidcup, Kent, for 10 Stove and Greenhouse Plants
To Mr. Hamp, Gardener to J. Thorn, Esq., South Lambeth, for 10 Stove and Greenhouse Plants
To Mr. Dennett, Gardener to W. H. Gilliot, Esq., for Erica intermedia
To Mr. Barnes, Gardener to R. Hanbury, Esq., for Barkeria melanocaulon
To Messrs. Henderson, Nurserymen, for Gloxinia grandis
To Mr. Ivison, Gardener to the Duchess Dowager of Northumberland, for Curcuma cordata
To Messrs. Veitch, Nurserymen, for Garcinia mangostana
To Mr. Smith, Gardener to J. Anderson, Esq., for correct Labels, in Class 1st
To Messrs. Rollisson, Nurserymen, for correct Labels, in Class 2d
To Mr. Turner, Gardener, Holloway, for 12 Alpines
To Mr. Stanly, Gardener to H. Berens, Esq., for 6 Cape Pelargoniums
To Messrs. Pamplin, Nurserymen, Lea-bridge-road, Leyton, for 12 Cape Heaths
To Mr. Williams, Gardener to C. B. Warner, Esq., for 12 Exotic Ferns
To Mr. Smith, Gardener to J. Anderson, Esq., for 30 British Ferns
To Mr. Bragg, Nurseryman, Star Nursery, for 24 Pansies
To Mr. Layton, Nurseryman, Hammersmith, for 6 Calceolarias
To Mr. Davis, Oak-hill, for a Providence Pine-apple
To Mr. Foggo, Gardener to the Marquis of Abercorn, for brown Turkey Figs
To Mr. Gainsford, Market Gardener, Brentford, for a dish of Mayduke Cherries
To Messrs. Henderson, Nurserymen, for Schizanthus retusus albidus
To Mr. Tyso, Nurseryman, Wallingford, for a collection of Ranunculi
To Mr. Salter, Nurseryman, Versailles Nursery, Hammersmith, for a collection of Irises
To F. Wigan, Esq., Clare House, East Malling, Kent, for 50 British Plants
To Mr. Wood, Nurseryman, Norwood, for 24 variegated plants.

CERTIFICATE OF MERIT.

To Mr. Bruce, Gardener to B. Miller, Esq., for Aphelexis humilis
To Mr. Cole, Gardener to H. Colyer, Esq., for Dipladenia crassinoda
To Messrs. Rollisson, Nurserymen, for Bishoffia javanica
To Mr. Macqueen, Gardener to H. Jones, Esq., for Lycopodium cæsium arboreum
To Mr. Mylam, Gardener to S. Rucker, Esq., for correct Labels, in Class 1st
To Messrs. Pamplin and Son, Nurserymen, for correct Labels, in Class 2d
To Mr. Epps, Nurseryman, for correct Labels, in Class 2d
To Mr. Smith, Gardener to J. Anderson, Esq., for 12 Alpines
To Mr. Ambrose, Nurseryman, Battersea, for "Prince Albert," a seedling Pelargonium of 1850
To Mr. Ayres, Nurseryman, Blackheath, for "Formosissimum," ditto
To Mr. Epps, Nurseryman, for a Seedling Heath, "Erica tricolor Eppsii"
To Mr. Munro, Gardener to Mrs. Oddie, for Wood's Hybrid Persian Green-fleshed Melon
To Mr. Bruce, Gardener to B. Miller, Esq., for Butler's green-fleshed Melon
To Mr. Chapman, Gardener to F. B. Glegg, Esq., for a dish of black Grapes
To Mr. Henderson, Gardener to Sir G. H. Beaumont, Coleorton-hall, for ditto
To Mr. Bragg, Nurseryman, for "Joseph Hunt," a Seedling Pansy
To Mr. Keynes, Nurseryman, for a collection of Ranunculi
To Messrs. Henderson, Nurserymen, for "Mrs. Stanley," a Seedling Calceolaria
To Mr. Dunsford, Market-gardener, Chingford-green, for a dish of Queen Strawberries
To Mr. Smith, Nurseryman, Hornsey-road, for Fuchsia "Inimitable"

ANTHONY'S PATENT AMERICAN CHURN.—A Correspondent writes as follows:—"I have much pleasure in bearing testimony to the superiority of Anthony's Patent Churn. Our dairy-maid generally gets the butter in five minutes, never more than 10. It requires care in admitting air through the handle, always removing any cream that may obstruct the opening from within."

Original may be seen at the Depôt.

KEY and MITCHELL'S Depôt for Patented and other new and useful Inventions, 97, Newgate-street, London.

MAGNUS'S ENAMELLED SLATE is handsomer and more durable than the choicest Marbles, is less than half the cost of the commonest, and is PATRONISED by her MAJESTY and PRINCE ALBERT, the Nobility, Clergy, Architects of Eminence, Engineers, Builders, Railway Contractors, and the Public generally. It is suitable for Chimney-pieces, Pier-table tops, Vases, Ink-trays, and ornaments of various descriptions, Billiard-tables, Baths, Wash-stand, and Dressing-table Trays, Door Furniture, Candelabra, Columns, Monuments, Head Stones, Mural Tablets, Pilasters, Plinths, Fonts, Grand Staircases, Balusters, &c., and is made to represent not only the marbles in ordinary use but all the more costly descriptions, as Porphyry, Rose Granite, Broccatella, Brescia, Lapis Lazuli, Malachite, and Florentine Mosaics, and has obtained the Medal from the Society of Arts. Bored Chimney-pieces, from 25s. upwards. Price lists sent on application to Mr. MAGNUS, PIMLICO SLATE WORKS, 39 and 40, Upper Belgrave-place, London.

*** Roofing and Plain Slate work, of all descriptions, at low prices.

TO BE SOLD.

THREE SUPERIOR LARGE PLANTS in good condition; viz., A BLOOD ORANGE in full bearing, about 25 years old, A CYCAS REVOLUTA, about 30 years old, and an AGAVE AMERICANA about 40 years old. The above are worthy of notice to those who may be in want of such.—Apply to SMITH and CARDNO, Seedsmen, Aberdeen.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

MARQUEES, SUN-BLINDS, RICK-CLOTHS, &c.—Manufactory, Old Kent-road, facing the Bricklayer's Arms Railway Terminus, and 17, Smithfield-bars, London.

"The guests are arriving; my villa has got
Quite a park-like appearance—a beautiful spot;
The band on the lawn, in the spacious marquee,
This tent for our dinner, and that for our tea."

Marquees and temporary rooms superbly fitted up for fetes, &c., on most moderate terms, by THOMAS EDGINGTON and Co.—Tents of every description, Rick-cloths, with poles, &c. Tanned Netting, for the protection of fruit-trees from frost, blight, and birds, and for the security of fresh sown seed either in gardens or fields, at unprecedentedly low prices, viz., 1d. per square yard, or 200 yards for 14s., or 500 yards for 30s., or 1000 yards for 50s. Sold to gardeners and shopkeepers by the cwt. —New Archangel Mats and Scrim Canvas for wall fruit; Tarpaulings for houses under repair, on hire. Orders and inquiries per post immediately attended to.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1d. per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

NEW FUCHSIAS, VERBENAS, AND PETUNIAS of Spring 1850, at very reduced prices, viz.:

FUCHSIAS.—Inaccessible, Kossuth, Beauty of Stortford, Mrs. W. Taylor, Sir J. Falstaff, Distinctus, Yorkshire Eclipse, Beauty of Richmond, Story's Striata, Unique, Duplex, Multiplex, South Devon, Mirabilis, and Ignea.

VERBENAS.—Mrs. Mills, Desdemona, Masterpiece, Monster, Calliope, Lura, Letitia, St. Catherine, Adonis, Gem, Rosea Alba, Rosy Morn, Village Maid, Beauty of Eye, Delicata, Magnificent, Margaret Catchpole, Sunset, and Wonderful. French varieties: Adela, Amie, Bajeans, General Brea, Gloire de Paris, M. Lequay, Niobe, Pauline, Phaeton, and Perrier.

PETUNIAS.—Queen, Herseeana, Picta, Letitia, Youngii, North London, Exquisite, Queen of England, King of Crimsons, Attraction, Gem of the North, and Rose Superb.

The above Verbenas may be had at 12*s.* per dozen, or six for 7*s.* 6*d.*

MIMULUS.—Criterion and Elegans, 1*s.* 6*d.* each.

All orders will be supplied in strict rotation. Apply to HENRY WALTON, Edgend Marsden, near Burnley, Lancashire.

All orders to be prepaid, and made payable at Burnley.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE sent prepaid for four penny stamps, for postage. This Catalogue contains a rich assortment of the newest and best plants which can be procured. The stock of BEDDING PLANTS is unusually strong and fine. Several thousand plants of Verbenas are now ready for sending out, as well as our collection of other plants for bedding, the stock of which is also very extensive, consisting of Geraniums, Fuchsias, Petunias, Dahlias, Chrysanthemums, Anagallis, Bouvardias, Cupheas, Heliotropes, Plumbagos, Lantanas, Salvias, Lobelia Erinus grandiflora and compacta alba, Zauschneria californica, &c.

Persons requiring Plants for beds may depend on receiving a supply, strong, and in fine condition, at low prices.

Seed and Horticultural Establishment, Sudbury, Suffolk.

THE FUNEBRAL CYPRESS—CUPRESSUS FUNEBRIS.

MESSRS. STANDISH AND NOBLE, of the Bagshot Nursery, beg to announce that they are now sending out the above magnificent Weeping Evergreen Tree, the hardiness of which is now proved beyond all doubt; and for particulars proudly refer their patrons to the highest authorities, viz., Dr. Lindley and Sir W. Hooker—see *Gardeners' Chronicle*, April 21, 1849, and April 13, 1850; Curtis's Botanical Magazine, for May; and the Gardeners' Journal, March 9 and 16 for the present year. Strong healthy plants, fit for immediate planting, 21*s.* each.—Bagshot Nursery, Surrey.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER, AND CELERY.

JOHN CATTELL, SEEDSMAN and NURSERYMAN, Westerham, Kent, begs respectfully to inform the public that Plants of his superior true sorts of the above are now ready, and will be forwarded, as usual, to order, on receipt of postage stamps or Post-office orders, at the undernamed prices, basket or mat and package included:

All the sorts of early Cabbage, Savoy, and Kale, including Brussels Sprouts, 4*s.* 6*d.* per 1000; all the sorts of Autumn and Spring Broccoli and Red and White Celery, 6*s.* per 1000; Cauliflower, early and late, and Red Cabbage, 9*d.* per 100; Drumhead or Cattle Cabbage, 3*s.* 6*d.* p. 1000.—6*d.* per 1000 less when no mat or package is required. Packages of 1000 and upwards delivered free of carriage to the Edenbridge Station of the South-Eastern Railway.

Seeds of CATTELL'S superior "Dwarf Barnes," and his "Dwarf Reliance" Cabbage, may be had in packets, by post, for 12 penny stamps per packet, the former containing 1 oz., as usual, and the latter ½ oz.

BEAUTIFUL BOUQUETS OF FLOWERS are kept perfectly Fresh and Blooming for several days in Glasses constructed for the Button-hole, the Hand, or to be inserted in any part of a Lady's Dress or Hair, at 2*s* per dozen; or forwarded by post to any part of Great Britain or Ireland—in boxes containing one dozen, 2*s.* 6*d.*, postage included, on receipt of stamps to the amount, by JACKSON and TOWNSON, 89, Bishopsgate Within, (opposite St. Helen's-place), London.

AMERICAN NURSERY, BAGSHOT, SURREY.

GEORGE BAKER begs to inform the Nobility and Public his extensive collection of AMERICAN PLANTS are now in bloom, and will continue till the end of this month, and may be seen gratis. The Nursery is about 6 miles from the Staines Station, on the South Western Railway, and 3 from Virginia Water, from whence conveyances may be obtained.

G. BAKER is a contributor to the Exhibition in the Botanic Gardens, Regent's Park.—June 22.

BEE HIVES.

GEORGE NEIGHBOUR AND SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—127, High Holborn, London.

Agents: WM. DRURY, Castle-street, Liverpool; HALL and WILSON, 50, King-street, Manchester; AUSTIN and M'ASLIN, 168, Trongate, Glasgow.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co. beg to notice their mixtures for laying Land down to Permanent Grass are now ready. The general satisfaction they have given for many years past, and the present low prices of 32*s.* per acre, allowing 2 bushels and 12 lbs. to each acre, they trust will ensure a continuance of orders. Mixed Seeds for improving old Grass Land, 1*s.* 3*d.* per lb.; fine sorts for forming Lawns, 1*s.* 4*d.* per lb. Their Priced List for the season of Turnips, Mangold Wurzel, and other Farm Seeds, will be forwarded on application to 26, Down-street, Piccadilly, London.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long, 13 feet wide, 90*l.*; 21 feet long, 13 feet wide, 50*l.*; 12½ feet long, 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber boxes, Iron hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

HORTICULTURAL SOCIETY OF LONDON.—HIS GRACE THE DUKE OF DEVONSHIRE, President of the Horticultural Society, has kindly directed the Grounds of Chiswick House to be opened for the reception of the visitors to the Society's Gardens at the next Exhibition, on SATURDAY, the 13th JULY. Tickets are issued to the orders of Fellows of the Society only, at this office, price 5*s.*; or at the Garden, in the afternoon of the 13th July, at 7*s.* 6*d.* each, but then also only to orders signed by Fellows of the Society. But respectable strangers, or residents in the country, who will forward their addresses in writing to the Vice-Secretary, 21, Regent-street, on or before Thursday, the 11th of July, may obtain from that office an authority to procure Tickets on this occasion. No official orders for Tickets will be issued after that day.

N.B.—No Tickets will be issued in Regent-street on the day of Exhibition.

ROYAL BOTANIC SOCIETY, Regent's Park.—The LAST EXHIBITION this season of Plants, Flowers, and Fruit, will take place in the Gardens on WEDNESDAY, July 3. Tickets to be obtained at the Gardens, only by orders from Fellows of the Society, price 5*s.* each, or on the day of Exhibition, 7*s.* 6*d.*

SLOUGH PINK ANNUAL SHOW will be held at the Star Nursery, on MONDAY, JULY 1. Prizes will be given to Amateurs and Nurserymen for 12 blooms. Certificates will be awarded to Seedling Florists' Flowers.—Flowers to be ready for the judges at 1 o'clock.

HERTFORD ROSE NURSERIES.

E. P. FRANCIS'S new and extensive collection of ROSES will be in bloom on and after June the 25th, and will continue in flower during the autumnal months. The greatest perfection of bloom will be about the first and second week in July. An early inspection of Amateurs, &c., is respectfully solicited. Cut blooms will also be exhibited at Mr. CLARK'S, Seedsman, 25, Bishopsgate-street, during the season. Trains direct to Hertford from Shoreditch Station.

Hertford Nurseries, June 22.

ROSES.

H. LANE AND SON, Great Berkhampstead, have the honour of informing those who take an interest in this beautiful flower, that their Splendid and Extensive Collection will be in Bloom after the 27th of June. Those who wish to inspect the whole should devote six or eight hours at the Nurseries, which commence within a few minutes' walk of the Berkhampstead Station of the London and North Western Railway.

NOVELTY, ELEGANCE, AND DURABILITY.

R. RESTELL'S PATENT METALLIC ORNAMENTAL GARDEN and CONSERVATORY LABELS, in a variety of patterns; may be written upon freely, are flexible, and calculated to last for 20 years.

To be had of the principal Seedsmen and dealers in Horticultural Implements.

Manufactory, 35, High-street, Croydon, Surrey.

The Gardeners' Chronicle.

SATURDAY, JUNE 22, 1850.

		{ Zoological	9 P.M.
WEDNESDAY,	—	26—Royal Botanic	3½ P.M.
THURSDAY,	—	27—Royal Soc. of Literature	4 P.M.
FRIDAY,	—	28—Philological	8 P.M.

COUNTRY SHOWS.—Tuesday, June 25: Handsworth and Lozells Horticultural.—Wednesday, June 26: Manchester Botanical and Horticultural.—Thursday, June 27: Liverpool Horticultural, and North Wilts Horticultural.

IF a man talks of VIRGILIUS, or HORATIUS, or JUVENALIS, he is set down in Scotland as a Dominie, and in England as an ass. Yet the naturalist who dares to speak of Clianth and Oncid, instead of Clianthus and Oncidium, is regarded as a troublesome innovator; and if he ventures somewhat further, and prefers Birthwort to Aristolochia, Tangle to Fucus, or Liverwort to Marchantia, he may expect to take rank as a scientific Chartist. Nevertheless, the very persons who condemn such modes of speaking would be the first to exclaim against calling *Viburnum opulus* by any other name than Gueldres Rose, or *Galanthus nivalis* otherwise than Snowdrop.

How is it that the practice of pedantry among scholars is admitted on all hands to be an offence against good taste, and that the absence of it among naturalists is also looked upon as an offence against good taste? Why do men thus blow hot and cold with the same breath? How is it that scholars who understand Greek and Latin, drop those languages in English composition, and that naturalists require persons who know nothing of such tongues to be always making grotesque efforts at talking them. This seems to deserve some examination on the part of those who think that natural history should be made interesting to all classes, and identified with their familiar thoughts, a result that will never be arrived at so long as the nomenclature of organised bodies is a chaos of Greek and Latin compounds, whether barbarous or formed upon the soundest principles.

It may be alleged that the practice of adapting classical names to the English tongue is not universal; and that, if we have pruned VIRGILIUS and OVIDIUS down to VIRGIL and OVID, we have left CORNELIUS NEPOS and QUINTUS CURTIUS in their ancient shape. Why this has happened we know not. Possibly because these names are much less used in conversation than the others, for CORNEL sounds as well as VIRGIL, and would arise out of an application of the same process of curtailment; nor do we see why QUINTIN CURT should be excluded from a language which recognises QUINTIN DICK. At any rate, among the best authorities, the practice has gone much further than is suspected; in proof of which we have only to refer to the words Cynosure, Zephyr, Ethiop, Arcady, employed by MILTON and others, or to such names as CEPHISE, HIPPOLYT, ÆSCULAPE, DIAN, CAMILL, and HYACINCT, which are familiar to all readers of SPENSER.

Our good old Saxon tongue consists mainly of words of one or two syllables; and it will always be found that the purest and best English writers shunned long words taken from Greek and Latin. The sonorous but corrupt style of some of our great authors introduced, indeed, a great change in this respect. With them language was—

> "English cut on Greek and Latin,
> Like fustian heretofore on satin."

But scholars happily saw the evil of this, and hence the sesquipedalian style has made no progress. Had it been otherwise we should by this time, like the Germans, have excited the astonishment of the world by words extending across a page. Does any one imagine that our forefathers would have kept even Quercus in their vocabulary, if they had not possessed its equivalent in Ac or Oak; undoubtedly they would have cut it down to Querk in spite of the lawyers. And, in like manner, Fagus would have become Fage, or Fege, or Phege; but they seem to have found a substitute in Beech.

The universal practice of society is to expel technical words from familiar language, wherever it is possible to do so. A naturalist would be laughed at who talked of a *Rana temporaria*, meaning a frog, or of *Curruca Luscinia*, meaning a nightingale, or of *Falco fulvus*, or *Aquila chrysaëtos*, meaning a golden eagle. Would anything be more preposterous than to call KEENS' Seedling Strawberry, *Fragaria virginiana*, or Sweet Vernal Grass and Cocksfoot, *Anthoxanthum odoratum* and *Dactylis glomerata?* It is only necessary to allude to such cases to show their extreme absurdity.

The truth is, that all nations like to speak their own language, if they can, and to fashion foreign words to the shape of their own organs of speech as nearly as they find possible; and hence we English have changed TAILLEBOIS into TALBOT, cinqfeuille into cinqfoil, and so on. And we cannot but think that those who have kept this in view in modifying the foreign names current in natural history, have acted upon a principle the soundness of which cannot be well disputed. It does not, however, follow that the principle has been judiciously applied. On the contrary, it must be conceded that an error has been committed—that error is translation instead of adaptation. A better course would have been adaptation to the exclusion of translation. The best course is the skilful mixture of the two.

The objection to translated names consists in this—that the naturalist who uses them has to burthen his memory with two names instead of one—the vernacular and the technical. And this we take to be the true and only valid objection to translated names, provided the translation is made on correct principles. It must we think be admitted that Toothtongue is more conformable to the English language than *Odontoglossum*, and Cutridge than *Acrotemnus*. Nor is there anything in such names at variance with the usual construction of English compounds. Objections to them on such a ground are only prejudices. The great fault in Toothtongue and Cutridge is—not that they are badly constructed words but—that they compel the naturalist to recollect them, in addition to *Odontoglossum* and *Acrotemnus*, which are indispensable. Science requires a universal nomenclature, suitable to all countries, and that must be preserved, in addition to any local nomenclature.

We freely admit the force of this objection, and for this reason, but for no other, willingly advise the abandonment of further attempts at translated words—unless in cases where the English equivalent is in general use, as in Birthwort for *Aristolochia*, or Daisy for *Bellis*, or where the technical word is not susceptible of adaptation. We would therefore rest content with Dendrobe for *Dendrobium*, Camarote for *Camarotis*, and Acroteme for *Acrotemnus*. But there is an abundance of cases in which adaptation is impracticable. We may legitimately curtail *Odontoglossum* into Odontoglot and *Ionopsidium* into Ionopsid; but what is to be done with names like *Hypoelytrum*, *Holmskioldia*, *Luzuriaga* or *Ornithocephalus?* No art can Anglicise them. They must be translated, or changed, or left in their original deformity. This question however need not be raised just now, because they are either of rare occurrence or confined to technical science.

We own that this question appears to be one of much public interest; and we shall gladly publish any adverse views with which our correspondents may favour us. We shall scarcely be suspected of writing to embarrass science. Our real purpose is to make it easy and popular, and we firmly believe that if natural history is not to be locked up in the cabinets of *virtuosi* its language must be made as familiar as household words. In saying this we

believe that we express the opinion of a vast majority of all classes of society; an opinion in which we are the more confirmed from seeing that a large number of adopted words have already established themselves securely in common language within these few years.

In the fourth volume of the Journal of the Horticultural Society is a remarkable paper by Mr. GLENDINNING on the best season of the year in which TO TRANSPLANT LARGE EVERGREENS. In opposition to the usual opinions upon this subject, he selected the hottest and driest month of the year. His words were these:

"It would be travelling over a beaten track to enter into any general detail respecting the ascent and descent of the fluids in plants, and the formation and deposition annually of new wood in all ligneous vegetation. It will be sufficient for my purpose to state that this extension and formation takes place chiefly after Midsummer, and principally in evergreens during autumn, when the young shoots begin to attain a certain degree of consistency. It is during this downward tendency of the fluids, and when the solar action is in some measure on the decline, that I should seize and conduct with all rapidity the operations of transplanting; and, if this is intended to be conducted extensively, I should recommend the end of August as a good time to begin, September being the *safest* month in the year; selecting such plants to commence with as have matured their shoots." Another and very important reason remains to be stated why autumn is to be preferred for undertakings of this kind in preference to winter. The force of the sun during summer, although now on the decline, has warmed the earth to a considerable degree and depth, so that the mutilated roots are comparatively situated on a gentle bottom-heat, which rapidly promotes cicatrisation, and frequently aids the emission of young spongelets during the current autumn.

"That the season which I have here ventured to urge for the performance of the work under consideration is undeniably theoretically the right period, appears beyond all question; and being no mean experimentalist in rural embellishment, with plants of considerable magnitude, I can attest also that it is practically the season to be preferred beyond all others. I had occasion to superintend the removal of upwards of 2000 trees and shrubs, all evergreen, and varying in size from 6 to 40 feet high, during one autumn. The trees were prepared as formerly described the previous spring, and as the undertaking was rather gigantic, the work was begun in August and finished with the year. The result was of course watched with some interest, and the following summer, when an examination took place, I found that those trees which were transplanted early in the season indicated little change from their removal, but the contrary was the case with those which had undergone similar transplantation during December. In fact the gradual diminution of the motion of the sap, accompanied with declining atmospheric action, which tended, in conjunction with the usual autumnal precipitations, to cool and saturate the earth, clearly and progressively exhibited our comparative success."

In alluding to this statement on a former occasion we said that some experiments were in progress with a view to testing the soundness of Mr. GLENDINNING's advice; and we now proceed to report the result. In September, 1849, the following work was done within our own observation.

1. Some hundred feet of a Holly hedge, about 25 years old, were transplanted, and although from the dryness of the soil, badness of roots, and other causes, there was great reason to fear the result, these plants are now (June 20, 1850), with a very small number of exceptions, safe and growing.

2. A Holly tree about 12 feet high, forming part of the same hedge, which had been left for some days with its roots covered by a mat, and was much dried, was carried a quarter of a mile and replanted. It is now casting its old leaves, and pushing well.

3. The following plants were also transplanted at the same time. Several common Laurels and Portugal Laurels, from 4 to 6 feet high, dug out of a shrubbery; 75 Rhododendrons, 14 Arbor-Vitæ, 4 to 5 feet high; 16 Laurustinus; 9 Yews, 4 to 5 feet high; 4 green Hollies of the same size, 2 Cupressus torulosa, and some other plants. They were all taken from the open quarters of a nursery, not having been potted; the weather was hot and dry. The only casualty among them consists in one Arbor-Vitæ being dead. The Cypresses were half killed by the winter; and a few of the Yews are making buds slowly, but they are beyond all risk of death.

All that was done in aid of the operation was, to scatter superphosphate of lime among the roots of the transplanted Hollies, to throw mats over the old Laurels, for the first three weeks, their shoots drooping under the influence of the hot sun and dry air; and to wrap a straw bandage round the stem of the largest Holly, in order to keep it a little moist.

This experiment is, we think, conclusive in favour of the advice given by Mr. GLENDINNING; and thus it appears that those who wish to form evergreen plantations, in harvest time, may do so not only with security, but advantage; for it is probable that much greater loss would have been sustained even in November.

THE MANETTII ROSE—AN AUTOBIOGRAPHY.

SOME time in the year 1836, or it might be 1837, my master, Signor Manetti, then living on the banks of the Lago de Como, and in whose garden (Oh! what a beautiful climate for gardening) I was growing, took it into his head to graft and bud some delicate sorts of Roses into my branches. I was so foolishly good-natured as to suffer them to grow; aye, even to nurse them into a vigour foreign to their nature. Alas, that I should find such ingratitude in man; for my beloved master, seeing the effects of my careful nursing, immediately cut me to pieces, distributed a great portion of my branches among his friends, and the remainder planted in his own garden. I felt so strong an attachment to him and such lively gratitude, for he was indeed the author of my being, that I determined to show him how docile and kind I could be. Accordingly I managed to put out roots from every shoot, however minute, little thinking of the consequences. Guess, then, my astonishment to find one day in November, a part, a very small part, of myself, with those unlucky roots attached, packed in a small box, introduced into a large case called a "bookseller's parcel," and sub-directed to a Mr. Rivers, living in a small obscure village, so I understood it to be, in England. "Alas! my beloved Como," I could not help saying, "must I then leave thee, thy sunny skies, thy charming waters, to live in exile in that foggy England, in a village with a barbarous name, quite unpronounceable to refined and musical ears—a name beginning with S and ending with h; no, it cannot be." Such was my box soliloquy; the end of all this was my safe arrival at Saw— (I cannot write the remainder), my being unpacked by a regular enthusiast, and my transference to a very pleasant locality and agreeable soil. The coolness of the climate, in contrast with my beloved, but rather too warm, Italy, delighted me; so I determined to enjoy myself by growing as fast as I could, even in what they call here the "heats of the summer." Poor creatures, they know not what heat is! I thought my new master would feel so delighted with my docility that I should remain unmolested, but no; the moment he found it out (for, on his planting a small piece of me the first season I came into his possession, I put forth all the roots I could), he cut me absolutely all to pieces.

My axiom at the outset of life was the well-known precept, "Return good for evil." I did not forget it; and every cutting rooted, while my ill-tempered neighbour (Rosa indica grandiflora), who came over in the same case, being cut up in the same way, would not put forth a root; I thought then he was wiser and better than myself, but I now think otherwise, for while I am daily making friends all over the world, my companion is unpruned, untouched, and despised for his selfishness. To pursue my narrative; my English master, taking advantage of my docility, propagated me largely, and distributed my offspring among his friends with a liberal hand. I cannot trouble you with all my adventures, for be it understood, although formed into cuttings innumerable, my spirit was not divided, my sympathy remained intact; I am able, therefore, to tell how that my master sent me over as a valuable present to a place with a long outlandish name called Berkhampstead, also in Hertfordshire. Many places and persons in this county are, I believe, very rude and barbarous. My new master at this place, Mr. L., did not seem to look upon me with a very affectionate eye, and for three or four years he insulted me very frequently, and cut me to the heart by saying "What occasion have we for any new Rose stocks, the Dog-rose is good enough for everything. I think, Mr. Manetti, you are a humbug, like your Italian fiddlers and your English master who sent you to me are." Here I lost the remainder of his speech; he has, however, lately atoned for past neglect, and has been very attentive and respectful to me.

My journey to Cheshunt, alas! has not been attended with the like result; my friend Rivers, wishing to make every one acquainted with my merits, sent me to his neighbour, Mr. P., some five or six years ago, with a very high character. Anxious to support this, I grew away with all the vigour I could muster, for I found the soil very rich, cool, and agreeable. My rival, the Dog-rose, growing in the same bed, told me, with a malicious grin, that "the soil was too good for me." I despised the inuendo, and grew and towered up above him, looking down upon him in the autumn with the same contempt that my new master, Mr. P., looked up to me, for he soon began to find fault, and said that I was too sappy, too luxuriant; in fact, good for nothing. Now this was really very unjust, and I explained to him that I did not want so rich a soil, that I should indeed prefer Bagshot-heath, and that if I did not find friends at Cheshunt, I might be distributed among his customers, and perhaps find favour in poor light soils. My master, however, seems to have what they call in my country "*una testa di porco*," a very expressive term, and would not listen to my defence. Were it not, therefore, for my old first friend, and some new friends at York, I should be in a most neglected state; but I hope for assistance from you, and in return, if you ever wish to bud me, I will not prick your fingers. *Rosa Manettii.*

DISEASES OF PLANTS.

(*Continued from p.* 373.)

THE principal opinions on the causes of rust, blight, melume, yellow blight, and carbuncle, may be reduced to four. Some attribute them to the mists, which either by their acrid and corrosive humidity, or by the minute drops acting on the tender young plants like so many lenses, burn, corrode, and disorganise those parts of the plant on which they act. Others, with our Ginanni, will have it that these diseases, especially the rust, consist of a mass of minute insects which eat into the plant; that these insects, under the epidermis of the leaves, cause the rust to appear in the form of vesicles, and corrode the stalk, if rain does not come to wash them away. The most generally received theory, first put forward in 1766 by the celebrated Dr. Giovanni Targioni-Tozzetti, is, that these diseases consist in the vegetation of cryptogamic plants, arising under the epidermis of corn; and, according to others, also on leaves and fruits of trees: and this has been confirmed by the microscopic observations of Fontana, Saussure, and more recently of Bauchs, who has published several figures of them. Finally, Tessier, in his treatise on the diseases of corn, attributes rust to a stoppage of the transpiration of the plant, caused by mists, and he remarks that it is precisely the most vigorous plants which, from their more copious tranpiration, are the most infected by it.

The opinion of Targioni has been latterly illustrated by several others, but I confess that I cannot yet bring myself to adhere to it. Some difficulties occur to me in the fact that notwithstanding the microscopical researches of Bauchs, others see differently, also through the microscope. It appears also that he was unacquainted with the chemical and microscopical investigations of Girod-Chantrans, which have been passed over in silence by all those who have written on these diseases. Unless his work be treated as a mere romance, his arguments ought at least to be refuted; for although some may not be confirmed, there are others which appears to deserve paying some attention to. Not, however, that I agree with him in seeing swarms of insects where others see series of plants, for I rather follow Knight in thinking that even in the case of aphides they require a morbid predisposition in the plant to attack it.

Another difficulty in the explaining these diseases by their being the result of cryptogamic, as it were intercutaneous vegetation, is the necessity of having recourse to principles which will not so readily be admitted by all impartial persons. In the case of the rust, for instance, some will have it that it is one plant, some that it is two different ones; and the manner in which they explain its appearance is precisely the same as that which those adopt who consider it an animal production. It is agreed that the seeds of these plants attack the cerealia externally; and to show how this can be, they say they are minute enough to penetrate through the organic pores of the epidermis, establish themselves underneath it, and take root in the cellular tissue or parenchyma of the plant. Gautieri, on the other hand, in a memoir on the means of destroying rust in Wheat, gives a totally different explanation of its mode of production, though founded also on the observations of Bauchs and Carradori. With all due honour to these great men, I confess that they leave me still in doubt, and I have therefore classed all these blights amongst diseases of which the cause is not determined.

If to all these opinions it is wished that I should add my own, I should commence by remarking that all agree in one point, that is, in the circumstances under which rust usually shows itself. I say usually, because some exceptions observed have occasioned those doubts which prevent me from laying down new hypotheses. Fields in low situations are generally the most subject to the disease, although in some years elevated spots have been more infected than low ones; so also fields well manured or naturally rich have been the most affected. The milder or hotter the season the more these blights abound, especially in hot and moist years. Fields adjoining irrigated or Rice grounds have most rusty plants. In little mountain valleys, much subject to fogs, blights abound. The greater the vigour of vegetation in the plant, the more it has to fear from them. All this would induce me to lay down that the cryptogamic plants, the minute insects, or the exudations, whether dry or not, are rather symptoms of the disease than the disease itself, which is a result of excessive vigour or over-repletion. And I am the more induced to believe it, as I have observed that weak trees and corn growing in poor soils are less liable to blights and rust. It may also be that the transpiration is checked by the particles of wet (and for that they need not act as lenses but as mere obstacles), and that there follows a disorganisation occasioned by the matter of transpiration itself, which might easily happen, considering that it is chiefly oxygen, and that facilities are thus given for the development of extraneous matter, vegetable, animal, or whatever it may be.

I regret that I am unable to suggest any means, easy of execution, to ward off or to cure these diseases. I am forced to repeat what has been said from the days of Theophrastus to the present time. Many books tell us that when seed beds are exposed to fogs or mizzling rains, lines of packthread stretched across will preserve

them from rust. This method is easy to suggest, but not so easy to put in practice in fields on a large scale. Others propose shaking trees to prevent their fruit being affected. If it be the case of a very small orchard or garden that may be done, or copious aspersions of water may have the same effect, as we know that if when rust appears after a fog, heavy rains follow, the plants will recover. Bauchs recommends the rooting up all young plants of Wheat attacked by rust, conceiving that the disease may be contagious. But even where this course can be adopted there will always be the objection of the mischief occasioned by disturbing the remaining plants. The only remedy applicable to grain, if it is not yet in ear, is to mow it down so that it may shoot up again. I would even advise the mowing down, though the ears be already formed, if they be not yet or barely fecundated. I have seen Wheat fields, destroyed by hail and cut down to a third of their height, produce fresh ears, although much smaller than the previous ones. Care must be taken not to give the rusty haulm as food to any animals, as it is very hurtful.

To preserve trees from blight, or diminish its ravages, it appears that the working the ground round them, and the so disposing the branches as not to crowd each other, may be useful. Above all, I should recommend that the ground be well drained, and no stagnant waters allowed in the vicinity. No dung should be used as manure, especially for Wheat, that is not well rotted. I know well that, in spite of all precautions, blights will attack both grain and fruit trees, but still neglect of precautions will very much increase the mischief.

VILLA AND SUBURBAN GARDENING.

It is a truism oft repeated that a garden can afford but little enjoyment unless good cultivation and cleanliness form its chief characteristics. Roses covered with aphides, Cabbages spoiled by caterpillars, Gooseberry bushes stripped of their foliage by similar means, are matters of but too common occurrence. What possible enjoyment, then, can be derived from such wretched gardening? To reap pleasure, and profit likewise, such things must not be permitted to exist; ordinary attention, combined with a little perseverance, will soon overcome the ravages of such pests. Much, however, depends upon the period when the attention I speak of is brought to bear upon the enemy. It is useless to lock the door when the steed is stolen. The first evidence of the presence of our foes ought to put us on the alert. To those accustomed to watch the ravages of caterpillars, and the rapidity with which they destroy the leaves of Cabbages or Gooseberries, the necessity of early vigilance will be apparent. In a few hours, in the early stage of that evil, by careful picking, one person will do as much as ten will when the mischief is permitted to exist for only a few days; and I question much if any of the numerous recipes so confidently recommended are likely to cure the evil so economically or so effectually as hand picking. This is at least a safe and sure remedy. It is prudent too, just when the young foliage begins to develope itself, to distribute fresh slacked lime every two or three days over the soil and close up to the stem of the trees. To some extent at least this will check their migratory movements. It is true that caterpillars do not consume the fruit, but then fruit ripened without leaves, if it swells or ripens at all, is tasteless and worthless.

With respect to the Cabbage tribe, which is subject to the attacks of caterpillars, the only remedy yet devised is hand-picking, and if early and careful attention is paid to this, no such thing as tattered leaves will exist. In small gardens, where the atmosphere is confined, insects of all kinds are more abundant, and they increase with much greater rapidity than in larger and more open situations; consequently the amateur suffers more, and hence the necessity of urgently drawing his attention to this matter, and emphatically pointing out the mode of suppressing these evils.

Red spider is another of the enemies which deface the foliage of many plants, especially in small gardens, and particularly plants against walls with projecting copings, or trees trained against houses where the eaves prevent either the rains or the dews from reaching the foliage. Although this formidable enemy is not quite so easily discovered with the naked eye as a caterpillar, it is nevertheless a more destructive and more unconquerable opponent. Still, if it is taken in time, it can also be subdued, and even expelled. Water and sulphur are the only known practical subjugators. If these are applied early and sedulously, no red spider can exist under their influence. Indeed, where it can be applied with impunity, through a powerful syringe or garden engine, water alone will completely subdue this tiny pest. *Pharo.*

TRADE MEMORANDA.

John Handford.—The following is a list of the various names and addresses which have been used by this man, to whom you have frequently alluded. It may be some satisfaction to know that he is safely in the gaol at Glasgow, having been committed for trial last week on the charge of obtaining goods under false pretences from a tradesman in that city.

Should the names, and the fact of his committal, meet the eye of your readers who have executed his orders, I should be glad to have particulars of their transactions with him, as also the letters they may have received from him. *Jas. Reay, Secretary to the Guardian Society for the Protection of Trade, Commerce-court, Lord-street, Liverpool.*

The names and addresses alluded to are—John Handford, 15, Norfolk-street, and Warwick-house, Park, Liverpool, Ruabon, Wrexham, Lytham near Preston, Bradford, Yorkshire, and Bridgewater-street, Salford, Manchester; John W. Handforth, Heath-street, St. James, Liverpool; Robert Warham, Warwick-house, Park, Liverpool; James Warham, Hurst Mills, Ashton-under-Lyne; John Wild, Eastham, Ellsmere Port, Chester, Preston Brook and Warwick-house, Liverpool; Robert Jackson, 15, Norfolk-street, Liverpool; John Roberts, Great Crosby, near Liverpool; John Robinson, Lower Frederick-street, Liverpool; Henry Soulby Melson and Co., Stock Exchange Chambers, Dale-street, Liverpool; John Bamford, 30, Gamble-street, Belfast; Joseph Handford, 11, George's-lane, Belfast; Charles White, Ashton-under-Lyne; John Newton, Bridgewater-street, Salford, Manchester; and Joseph Handford, Dudley, Warwickshire.

Home Correspondence.

Orchids for the Million.—The prices paid for the Orchidaceous plants at Mr. Bateman's sale, will, I fear, in some degree deter the humbler aspirant, but it must be recollected that these were many of them very rare, and many were fine specimens; and whether it was the *prestige* of Mr. Bateman's name, or the desire to benefit the charitable object of the sale, the plants sold, in most instances, at double the price they might have been bought for of the nurserymen. The slow growing plants, such as the Aerides, Vandas, Saccolabiums, &c., will always be dear. They are rare in their own country, and make but a few leaves a year; but the demand will, even as to these, soon increase the supply. Already we have had importations of Barkerias, and at the sales at Mr. Stevens' this year they might be bought in lots of 8 or 10 plants for less than a small scrap might three months before have been purchased. The Phalænopsis amabilis, so rare, is already becoming comparatively common—the demand created the supply—and 25 plants (new importations) were sold at Stevens' last week, and I have no doubt but that many more will soon arrive. It was only last week I received a basket of Orchidaceous plants from Rio, and found inside a bill printed in Portuguese and English, stating that the sender sold Epiphytes, tuberous roots, walking-sticks, bulbs, shrubs, &c., from Minas, Petropolis, New Fribergh, the Organ Mountains, Tijuco, Gaven, and several other parts of Brazil. I do not, therefore, mean to allow the high prices of Mr. Bateman's sale to deter me from urging the growing these plants in small cheap houses. Those who have any doubt on the question of their houses have only to pay a visit to Mr. Rivers, at Sawbridgeworth. There is a good sized house, made of boards, glazed, and heated for about 30*l.*; and his son has begun a collection of Orchids, and I own I never saw any plants better grown; and I should state that the house was not devoted to the Orchids alone, for up the rafters were trained Cucumbers; and I believe this year's crop has gone near to pay the whole cost of the house. Nothing can be more successful and interesting than Mr. Rivers' experiments in building cheap glazed sheds; he has several, in which he has planted the more delicate Pears (dwarf), Figs, standard Peaches, Vines trained to upright stakes, Strawberries, &c., and all bearing good crops. I think it is only necessary to see the great success of Mr. Rivers in the management of these houses, and the economy of their construction, to ensure his example being largely followed. *Dodman.*

Transmutation of Species.—The remarks of Professor Whewell on this subject, quoted in your Paper of the 8th inst., are very interesting; but I demur to his conclusion, "That species have a real existence in nature, and a transmutation from one to another does not exist." I apprehend that the greyhound and the spaniel would now be held to be distinct species, if we had not good grounds for believing that they came from the same stock. The short-tailed cat of the Isle of Man, whose motions strongly resemble those of the rabbit, is another striking instance of a strongly marked variety produced "under the influence of external causes." It is only by facts that the question can be settled, and statements have been published in your columns relating to some of the cereals, which show, if they are authentic, that the very transmutation which Professor Whewell denies, has actually taken place. However, all I wish to impress is, that it does not yet become either side to dogmatise. As bearing on this question, I enclose a "sport" (see woodcut), gathered from a yellow Calceolaria named "Heap's Defiance." It is the leading flower on one of the side shoots, and the corresponding flower of the other shoot is of the same anomalous form—I send both. I enclose also the true flower. The sport is certainly no improvement on the original, but it seems to me sufficiently curious *C. J. D., Rivington.* [It is an example of what is called technically a Peloria, that is, of an irregular flower recovering its regularity from the operation of some unknown cause.]

Leakage in a Swimming Bath.—It strikes me that your correspondent's bath leaks because (the foundation being upon an unequal bearing) one side is constantly changing its position, according as external influence may predominate; if so, the way to remedy the evil is to rebuild the whole bath, upon the old quarry, and clear of the rock, the water to be conducted from the rock to the bath by a wooden leat or trough of sufficient length; this being done the subsidence will be equal, and it will have no local tendency to separate. If this is thought too expensive, a trial may be made with Dutch terras mortar, which can be procured at Francis and Sons, Nine Elms, London; it has the property of vegetating, so as to fill up cracks as they occur. *W. Thorold, Thorpe Bower, near Norwich.*

Rose Stocks.—Although Mr. Saul is unfortunate in being unable by any means to grow the Crimson Boursault stock successfully, this misfortune cannot entitle him to assume that none can succeed where he fails. With respect to his description of the Boursault stock, I shall only observe that if I were to judge from my own stocks of the kind, and the favourable report of it by many large growers, instead of from Mr. Saul's experience, I should pronounce his (Mr. Saul's) opinion of its liability to decay to be erroneous, and its tendency to throw up suckers somewhat exaggerated; but believing that by some inexplicable accident of soil, cultivation, or some undiscoverable cause, Mr. Saul has found the stock to be faultful as he describes it, I shall pass on to that part of his letter which runs thus: "I happen," says "An Amateur," "to have living proofs in plants of these kinds (many of which trees are as many years old as the Manettii stock has been known in England)." Mr. Rivers states that he received the Manettii stock from Italy some 12 or 15 years ago. To what extent were Celine and Crimson Boursault grown as stocks at that period? Many of the Roses named by "An Amateur" have been introduced since that time. Had Mr. Saul asserted that neither the stocks nor any of the Roses I named were introduced here before the Manettii, then they who believed him must have disbelieved me; but while he admits that both of these stocks and some of these Roses were cultivated previously to the introduction of Manettii, what can there be wonderful in the foregoing quotation from "An Amateur?" In 1846 Mr. Rivers writes that the Manettii stock was received by him "some eight or ten years since from Como." Why, then, does Mr. Saul go beyond the extreme, and mention "15 years," especially since he must be aware that this stock has only been known generally amongst us about six or seven years at the utmost? But the facts contained in the paragraph he quotes from "An Amateur," remain untouched. The Roses, amongst which is a Goubault on the Boursault, of Mr. Rivers' growth, I mentioned in my former letter, were kept under my own charge, and I thus am enabled to declare them in no way subject to the evils Mr. Saul attaches to the unfortunate object of his antipathy. Mr. S. has misunderstood my remarks on the Cloth of Gold and Devoniensis. My expression meant that the finest Cloth of Gold in the kingdom was on the Celine, and the finest Devoniensis on the Boursault. Although Mr. Saul's failure may have been even more lamentable than he describes, it cannot weigh against the testimony in favour of the Crimson Boursault by our first Rose cultivator, Mr. Rivers, and many others. I cannot refrain from referring Mr. S. to Mr. Rivers's instructions for making cuttings, as calculated to stay a multitude of the ills which Mr. Saul has found to attend his cultivation of the Crimson Boursault stock. *An Amateur, Bristol.*—The poor Crimson Boursault and Celine stocks have been so abused lately by Mr. Saul, that I must really endeavour to give them fair play by stating the treatment proper for them, which does not appear to be generally understood. The Crimson Boursault is a Rose of remarkable vigour, but the wood is apt to suffer in winter from intense cold; it naturally produces strong root suckers, but as a stock we overcome these disadvantages, and turn this extraordinary vigour to account, when we take out all the eyes from the root part of the cutting and use it almost as a root stock, by budding nearly close to the soil. Mr. Rivers, in his valuable "Guide," most properly describes the manner in which cuttings should be made for stocks, but for the Crimson Boursault I think he will agree with me that 7 inches is a preferable length to a foot. The cuttings should be made from hard twiggy wood—in June, the top of the stock immediately above the shoot for budding should be carefully headed off with a knife (scizzors should on no account be used for this), it then thoroughly heals over, and there is no danger from decay. As many delicate growing Roses thrive best on the Crimson Boursault, while some grow more freely on other stocks, we must give in our adhesion to the belief that particular Roses have an affinity to particular stocks. Having myself introduced the Hybrid Bourbon Celine to public notice, I am happy to have received Mr. Rivers's approbation of the superior adaptability of this stock to the growth of several varieties. I freely admit that the Rosa Manettii is a most valuable stock for many, but I consider the Celine possesses an advantage in a greater rigidity of growth, with an equal degree of vigour and hardihood; for the Cloth of Gold it is acknowledged to be the best stock, and I have found it equally well adapted for very many others, delicate as well as free growers; there is however one disadvantage, viz., it does not strike quite so freely from cuttings in stiff soil as Manettii. *Henry Curtis, West of England Roseries, Moorend, Bristol.*

The Worton Cottage Meetings. — These weekly meetings for the examination of seedlings are evidently calculated to render good service to the cause of floriculture, and the reports in the *Gardeners' Chronicle* on the merits of the flowers sent there are read in the

north with much interest. The notices on new flowers in some periodicals are viewed with suspicion, and perhaps justly so; but the productions exhibited at these meetings are not only seen and reported upon by the censors of "Beck's Florist" alone, but also by those of the *Gardeners' Chronicle* and the "Midland Florist;" and they are likewise subjected to the inspection and scrutinising eye of many highly respectable florists who attend the meetings—florists who are successful cultivators of all the best varieties which are to be obtained; and it is this that gives a confidence in the reports, and stamps the adjudication of the censors as the "best authority on florists' flowers;" for no point either good or bad can well escape the critical eye of all the judges. The reports in the *Gardeners' Chronicle* must enhance the value and importance of the meetings considerably, as the exhibitors are thus enabled to ascertain every week the estimation in which their productions are held, instead of having to wait perhaps a month for the result; so that if any of the flowers are wanted for a second inspection they have a chance of sending them again before the bloom is past, which would not in many instances be the case if they had to wait until the issue of a monthly periodical. A great boon has unquestionably been conferred on both the trade and the amateur cultivator by the establishment of these meetings, and I congratulate Mr. Beck on the success which has already attended them, and which I have no doubt will soon become more apparent. *Zephyrus, Whitby, June 7.*

Spirits of Wine a Remedy for the Sting of a Bee.—One of my children, having been stung by a bee, was crying most piteously from the pain. After extracting the sting, having some spirits of wine at hand, I immediately rubbed the part with them, and the child ceased crying instantaneously. No swelling followed. Have any of your readers tried this remedy? *A Constant Reader.*

Adulteration of Soot.—One imposition is no sooner exposed than another just as bad is discovered. A small sweep in my neighbourhood is carrying on a famous trade in adulterated soot, which he sells with a large profit to gardeners and farmers. My attention was drawn to the subject by a gentleman of my acquaintance, who has for a long time past observed a copper coloured material being frequently unloaded from a cart which is drawn into a passage just opposite his house. This "copper coloured sawdust cart" never stops at the sweep's door, showing at once that something is amiss. I send a sample of the material, which mixes well with soot, and it would make a famous adulterer of guano, but some loam would be required to give it weight. *Dulwich.* [We believe this to be ground Valonia, or some such substance.]

Birds.—A pair of chaffinches having constructed their nest in a Rose-bush that ornamented a verandah in front of our windows, in due time introduced to the world three finely fledged birds; these, showing a desire (not unnatural) to resist parental authority, and return to the nest, the male chaffinch had recourse to castigation, by which method he succeeded in reducing his offspring to obedience, and drove them forth to seek a subsistence for themselves. Afterwards he returned to his labours, and on examining the nest we found that it still contained three birds, apparently not long hatched. Not far from the chaffinches' abode, and under the eaves of the verandah, a pair of tomtits (Parus cæruleus) had at the same time successfully reared and disposed of their young. A combat now took place between the male chaffinch and the male tomtit (the females having disappeared); the latter, although so much smaller, succeeded in driving his antagonist from the nest, and continued to chase him over the garden, heedless of the melancholy cries he uttered, as he flew disconcerted from place to place, with the ready food in his mouth. It appeared probable that the young birds would starve, whilst the rivals contended for the honour of acting a parent's part. At last, however, they have made something like an amicable arrangement. Both feed the young, and appear to avoid any encounter at the nest; but when they meet by accident the conflict is renewed, the chaffinch takes refuge in flight, and the tomtit delights in victory, after which they return again to the labours of feeding, which are carried on so incessantly that the voracious young birds now appear as likely to die from repletion as they were before from starvation. Is not this a singular infringement of the laws of Nature? *A. S. M., Spinfield, Great Marlow, Bucks, June 8.*

Plumbago Larpentæ.—I turned this plant out into the border last year, and left it there, little caring whether it lived or died; but I see, as others do, that it will stand the winter. *C. J. D., Rivington.*

The Gardeners' Benevolent Institution.—Your observations in the leading article of the 1st inst., relative to this institution, perfectly accord with my own opinion on the subject. When the charity commenced, and for several years afterwards, I took a good deal of interest in it, and went to some expense in writing to a great number of my brother gardeners, in order to induce them to become members; but even in those days my hopes were at times blighted; for nine out of every 10 of my applications were often ineffective. One said he would stop and see how the affair worked before he subscribed; others said at once that they were sure it would never answer; a third stated that he belonged to a benefit society; while a few imagined that being hearty and well circumstanced they were not likely to require any extraneous assistance. In reply to the first of these excuses, I said, "how can it be possible for an institution to be established or maintained while such a state of things prevail?" To the last I stated that I trusted I should never require the aid of the institution, but that while I lived I hoped to be enabled to subscribe my mite to so good a cause. I need hardly state, that in the course of time I did enlist many subscribers. I must acknowledge, however, that hitherto I have not entirely confined my support at elections to those who have been subscribers. When the society was in its infancy there were aged, unfortunate, afflicted people, of good principle, and really deserving, who had it not in their power to subscribe, even if ever so much inclined to do so, but now the Society having been established long enough for all to have made a commencement, in future I shall give my support to those only who have been or have become subscribers; and of course, except any very urgent case is brought forward, I shall only give my vote to those who have subscribed the longest. I am sure that all my brother gardeners who have become subscribers, and not grudgingly, will feel a pleasure in observing afflicted, aged, honest, and worthy men and their wives cared for. It will be gratifying to know that they are not obliged to go into a union, though I consider even the union workhouse a grand institution in its way; at the same time, people of industrious habits, who have weathered the storms of life, will make any kind of sacrifice before they will break up a little home, let it be ever so poverty stricken. It is certainly a hard case after a couple have weathered the storm until well advanced in years, that they should be obliged to break up their little respected home, and possibly be kept from each other's society for the remainder of their days. I therefore beg to solicit the attention of my brother gardeners to your remarks made on the 1st inst., and I trust that those who may have not yet joined this useful charity, and can afford it, will be induced to do so forthwith, and at the same time endeavour to make use of their best influence to induce others to support so good a cause. I have no doubt, also, that many well-behaved, industrious, well-respected gardeners will have no difficulty in inducing their employers to become subscribers. I can speak feelingly on this point, for years ago, on representing the matter to my present kind-hearted, liberal, and respected employer, I was at once desired to commence a yearly subscription, which has been continued ever since. I say again try if "thou cannot do likewise." My best wishes are towards the success of the charity, and I trust it may ever go on prosperously, and that those who may be induced to become subscribers may never require its support; but as it is natural to suppose that cannot always be the case, I trust that its support may at all times fall upon the most worthy of its members. *James Barnes, Bicton Gardens.* [If there were vacancies for all applicants, then we should not urge subscribers to confine their votes to the greatest subscribers; but as only a very small number of elections can take place annually, we adhere to our opinion, in which we know that all who, like Mr. Barnes, have no personal object to attain, must concur.]

Tropæolum speciosum.—This plant was left in the open border all winter, and it is now coming up vigorously in many places, the tubers having gone deep enough to escape the frosts. My garden is 500 feet above the level of the sea, but I never mark the thermometer so low as is given in the lists from Chiswick. *C. J. D., Rivington.*

Tomtits and Fruit-buds.—I have much satisfaction in being able to clear up the point in question, as to the object of tomtits and other birds in pulling off the blossoms of Cherry trees. It has been denied that they do this to any extent; yet one morning since I last wrote I saw the ground beneath one of my trees strewed with blossoms, and the birds plucking them off; and stooping down I picked up more than 100 within a square yard, not one particle of which appeared to have been removed, but they were all squeezed flat. On examining the blossoms on the trees at the same time, I found that each fully expanded flower contained about half a drop of clear honey, of a fine ratifia flavour, filling up the angular trough formed between the base of the tube of the calyx and the pistil. This honey appears to be secreted by the cells or glands at the base of the tube; for when the flowers first open, it is seen in the form of very minute dew-like globules, corresponding in position to the structure of the cellular tissue. In a short time, however, these globules increase in bulk until they touch each other; they then become confluent, and flow down in several channels into the trough above described. As no substantial portion of the flower is abstracted, I feel confident the birds feed on this honey. One may suppose that the old name of "nectary" had reference to its being either a secreting organ or a receptacle for this nectar. If the blossoms are examined about 24 hours after they are fully developed, it will be found that the greater portion of this honey has disappeared, and I believe it is partly absorbed by the pistil or embryo, for the peculiar high flavour of the honey is imparted to it, which is eventually found in the kernels of this and most stone fruits; the rest may be evaporated, as the aroma of the blossoms is of the same character. I have kept the blossoms I picked up for inspection. At the base of the tubes of the flowers of the Honeysuckle, there exists a thickening of the structure like the surface of a tongue, on which the honey globules are secreted, and this fluid is produced in such large quantities by Fuchsia corallina, that it flows down upon the foliage, owing to the pendulous nature of the flowers. Your talented correspondent "Mellarius" states that the honey is continually transuding through the pores of plants; yet my experience, which is only recent, shows that the process is only of short duration, and the quantity supplied dependent on the sunshine and other appliances. *F. J. Graham, Cranford.*

The Temperature of the present Month, June, sufficiently proves that this climate is not secure from frost until the sun has reached the solstice. On Saturday, the 16th inst., the temperature in Greenwich-park remained nearly the whole day below 50°, a piercing wind blowing from the North, with occasional showers of rain. The evening and night were cloudless and nearly calm, and a standard self-registering thermometer at Hyde-vale fell to 38°; another instrument placed upon a wine-cooler, 2 feet above the surface of the ground, registered 29½°. Low temperatures occur from radiation in the neighbourhood of Greenwich, at intervals, in the month of June. On the 8th, in the year 1838, it fell to 34°; on the 13th, in 1849, it fell to 32°. The coldest June on record, for the last 40 years, was in 1821, when the mean of the month was 5° below its average. The low temperatures of June, being generally preceded by storms of thunder and hail, would lead one to infer that the cold is a phenomenon of electricity—an inference borne out by the sudden formation of the clouds, the peculiar internal motion of their dense masses, and the restoration of an equilibrium in the atmosphere. The increase of the mean of the lowest temperature by night of June, upon January, is 18.33°; the increase of the mean of the highest temperature by day is 28.37°. The mean temperature of this month (June), for the last 35 years (for Greenwich), is 59.74°. *J. Henry Belville, Hyde-vale, Greenwich, June 17.*

Early Strawberries.—I perceive that Mr. Cuthill considers it early to send you this year a basket of his Black Prince Strawberry, gathered in the open air at Camberwell on the 12th of this month. Were I not 200 miles from you, as I am by rail, I could have sent you a basket of another variety gathered on that day in the open air, 2° to the northward, where vegetation averages at least a fortnight later. Mine were of the Aberdeen Beehive, a variety for which I gave a high price, and can by no means recommend. But it appears to have the good quality of coming in very early, probably earlier than any other; though part of the effect is doubtless to be ascribed to my liquid dressing, which I sent you some years ago; and which since I have used it has prevented my ever failing in a good crop, and having it much earlier than my neighbours. It is simply a mixture in equal proportions of the four salts—the carbonates of soda and potass, and the sulphates of soda and magnesia, in the usual quantity of an ounce to the gallon. In my ground it has done wonders; but I should add that it does not appear to have an equally good effect in every soil, some persons having complained to me that their beds have been injured by it. I have now used it for 9 or 10 years with uniform success. I have Keens' Seedlings ripe in the open beds now (18th), and have had for three or four days. *Iota, Lincolnshire, June 18.* [The Aberdeen Beehive has long ago been shown in this Journal to be an old discarded variety under a new name. The Black Prince is no doubt the earliest of the good varieties.]

The Cuckoo.—Has any one observed the cuckoo so as to be sure of any peculiar change or variety in its note? For the last fortnight one keeps near here, and even on Sunday it was in my garden. Its note is distinctly cŭck-cŭck-kōō, the first two notes in the usual tone, the last also. More than 20 persons have heard it. It is possible that there may be more than one, but I think there is but one. *Este, June 18.*

Salting Asparagus Beds.—This year I followed as closely as possible the directions given in your Paper some time ago for renewing apparently worn out Asparagus beds. My beds are situated on limestone land, but the soil is deep and rich. The beds have never been raised more than 18 inches or 2 feet from the level (not being considered necessary). They are at least 20 or 21 years old, and every year they have been gradually declining, but whether from bad management or age I cannot determine. About the end of January or beginning of February, the weather being tolerably mild for the season, I raked the soil off the beds with a small hand-rake until I had sufficiently bared them, without hurting the plants. I then laid 1½ inch or 2 inches of rich stable manure over them, and afterwards completed the beds with soil from the trenches which had been thrown back. Next day I watered with salt and water (refuse salt, 2*d.* per stone), the weather being mild and dry, and in wet weather I sprinkled them over with dry refuse salt, which the rain most effectually washed in. The effect was more expeditious than I had anticipated. About the end of March I cut a tolerably good dish very much larger and more delicate than I have had during the last two years, and on Tuesday, June 4, I had cut my eighth dish. They now seem disposed to run to seed, so I have ceased cutting. The beds I have are only 17 feet long by 4 feet broad, but they occupy so favourable a situation that they should be more productive than they are (with proper management). So far I have followed the plan recommended in your Paper, and I am satisfied with it this season. Another year must be the decisive one, but eight fine dishes this year, and only three poor ones last, seem to augur well for the future. *John T. Y., Parkhead.*

The Potato Disease has again made its appearance in Ireland. My attention having been directed to the subject by complaints from various parties, I examined my crop yesterday, and I find that it is decidedly diseased. The leaves are withered and crumpled up, with

the leaf stalks blackened, and brown streaks on the stem, below ground, to the very bottom; and as I have found many healthy looking stalks affected below the surface, I should say that the decomposition of the plant proceeds upwards from the roots, although the poison may have been imbibed through the leaves from the atmosphere. The kind I examined was the Ballygawley Pinks, a variety which has hitherto escaped with comparative impunity. I have seen some disease in another kind called McMullens. In a particular part of my crop, where the field was not so well manured, I should say that a fifth is diseased; where a better kind of manure was used, the plants look healthier, and are less diseased. But in a neighbouring field belonging to another person, I am certain that a third is affected. *A., Lurgan, Armagh, Ireland, June* 19.

Societies.

Horticultural, *June* 18. — J. R. Gowen, Esq., Treasurer, in the chair. F. W. Roberts, Esq., E. Hailstone, Esq., W. J. Myers, Esq., W. Cavendish, Esq., M.P., C. S. Maria, Esq., and W. R. Sams, Esq., were elected Fellows. The following "notice of alteration in the bye-laws" was read a second time. "The Council hereby give notice that they propose to substitute for Chapter VI., Article I., of the present bye-laws, namely, 'the admission-fee to be paid by each Fellow shall be six guineas,' the following words, viz.: 'the admission fee to be paid by each Fellow shall be two guineas.'" Among subjects of exhibition, Mr. Loddiges, of Hackney, sent a plant like Saccolabium Blumei, from Bombay, with a curiously formed lip, which looked as if its end had been snipped off. Mr. Cuthill, of Camberwell, received a Certificate of Merit for well ripened examples from the open ground of his Black Prince Strawberry, a kind now becoming universally cultivated, more especially for early crops. It is well flavoured, and very prolific. Specimens of his "ornamental metallic garden labels," both for hanging up and sticking into the soil, were exhibited by Mr. Restell, of High-street, Croydon. These were of various shapes, triangular and square; they ranged from 1*s.* 6*d.* to 10*s.* a dozen, according to their sizes, &c. From the garden of the Society were the somewhat scarce Cattleya granulosa, a variety of Epidendrum asperum, the spotted Brassia (B. maculata), Oncidium hastatum, Mr. Skinner's large flowered variety of Epidendrum cochleatum, two Cape Heaths, two Pimeleas, an Everlasting; the pretty New Holland shrubs, Tremandra verticillata and Hugelii; Dillwynia rudis, Boronia spathulata, a much better plant than was expected; Achimenes Escherii, Kleei, and the dwarf bright-scarlet A. pyropœa; Phyteuma violæfolia, a nice little hardy plant for rockwork; Statice mucronata, and the two Californian Abronias umbellata and pulchella, half-trailing coast plants, requiring nearly the same treatment as a Verbena. The latter has more colour than umbellata, but in all other respects it is less handsome.

Linnean, *June* 18.—The President in the chair. The Hon. East India Company presented a collection of plants, found chiefly in Assam by the late William Griffith, Esq., F.L.S. The President exhibited portions of trunks of winter bark trees, from the Straits of Magellan, cut down in 1826 by Captain King, R.N., affording inscriptions made through the bark by a midshipman accompanying the expedition of Captain Cordoba in 1786, and by a companion of Captain Bougainville in 1767, the annual rings in the former case distinctly corresponding with the interval between the two voyages; and made some observations on the structure of the woody vessels of the genus, which he described as closely resembling that of Coniferæ. Mr. Adam White exhibited some drawings of Rotiferæ by Mr. Gosse. The Secretary read some observations on the structure of the fruit of Punica, by J. Hance, Esq., Ph.D. The author was of opinion that the carpel of the Pomegranate is compound. With regard to the curious structure of the cells, he states that the lower ones arise from a central row of carpella, the cohering apices of which constitute the diaphragm, the ovules springing from the two united inner margins of the same carpellary leaf, and are consequently directed toward the centre of the ovary. The upper cells are formed by an external series of longer carpels alternate with the other, their cohering summits constituting the external portion of the style, and the ovules are borne on the entire inner face of the carpidia, as in Nymphæaceæ. The remaining portion of Mr. Bollaert's paper on the botany of the Texas was also read by the Secretary. The climate of the Texas was described as exceedingly favourable to vegetation; the species of useful trees and plants are numerous, and the soil and climate adapted to the culture of the Orange, Pine-apple, Vine, Cotton, and other plants requiring an equable warm temperature throughout the year.

Microscopical, *June* 13.—Dr. A. Farre, in the chair. A paper was read from J. C. Sorby, Esq., on the occurrence of fossil non-gymnospermous wood in the lias of Gloucestershire. The author stated that he had long had in his possession a piece of fossil wood from the lias, when, on recently submitting it to examination under the microscope, it exhibited distinct indications of the presence of ducts and vessels with imperfect spiral fibre. No indications of glandular woody tissue were seen in the specimen examined. Drawings were exhibited displaying the structure of the wood. Dr. Carpenter observed that annular vessels and ducts had been found in the Club-mosses and Ferns, although the specimens exhibited presented some of the characters of an exogenous vegetation. Should its structure turn out to be truly that of an Exogen, it would be the lowest bed in which these plants had been found. A paper was read by Mr. Legg, from Mr. Williamson, of Manchester, on the structure and habits of the animals belonging to the group Foraminifera.

Caledonian Horticultural, *May* 11. — Shrubby Greenhouse Plants.—Nurserymen: 1st, Messrs. Dickson and Sons, for Hovea Celsi, Chorozema Lawrenceanum, Bossiæa linophylla, Platylobium rhombifolium, Podolobium staurophyllum, and Azalea vandesiana. Practical gardeners: 1st, Mr. Reid, gr. to Professor Syme, for Tetratheca verticillata, Chorozema Lawrenceanum, Azalea lateritia grandiflora, A. Gledstanesi, Epacris miniata, and Pimelea Hendersoni; 2d, Mr. Sleigh, gr. to the Lord Advocate, for Eutaxia myrtifolia, Pimelea Hendersoni, Epacris miniata, and Azaleas exquisita, splendens, and Cupid; 3d, Mr. Cameron, gr. to S. Hay, Esq., for Pimelea spectabilis, &c. Rhododendrons: 1st, Mr. Rooney, gr. to Professor Dunbar, for R. fragrans and Cunningham's hybrid. Stove Plants (Orchids and Cacti excluded): 1st, Mr. Ritchie, gr. to W. M. Innes, Esq., for Gesnera splendens, Begonia coccinea, and Balsamina latifolia. Perennial Tropæolum: 1st, Mr. Douglas, gr. to H. Craigie, Esq., for T. tricolorum, trained upon a balloon-shaped trellis; 2d, Mr. Reid, for the same sort, trained on a pyramidal trellis. Cacti: 1st, Mr. Pender, gr. to D. Anderson, Esq., for Epiphyllum glaucescens and E. Hitchinii; 2d, Mr. Cossar, gr. to Lady Hay, for Epiphyllum speciosum and Conway's Giant Cactus. Tropical Orchids: 1st, Mr. Thomson, gr. to Dr. Neill, for Trichopilia tortilis, bearing 18 expanded flowers, and Calanthe veratrifolia. Auriculas: 1st, Mr. Forrester, for Ne plus Ultra, Fletcher's Mary Ann, Syke's Complete, Lord Brougham, General Morello, and Thomson's Revenge; 2d, Mr. Grieve, for Stritche's Alexander, Harrison's William Pitt, Eclipse, Smith's Waterloo, Ringleader, and Stritche's King. Broccoli: 1st, Mr. Gordon, gr. to J. H. Mackenzie, Esq., for Macdougall's Late White; 2d, Mr. Addison, Gosford, for a variety named Blackey's. Spring Cabbages: 1st, Mr. Lauder, for M'Ewan's Cabbage. Salads: 1st, Mr. Pender, for Radishes three sorts, Cresses four sorts, a brace of Cucumbers, Lettuces, and young Onions; 2d, Mr. Anderson, gr., Oxenford Castle, for Radishes, Endive, Corn Salad, Cucumber, Beet, Chicory, and Lettuce. Cinerarias, in 8-inch pots: 1st, Mr. Henderson, gr. to C. K. Sivewright, Esq., for Bessy, Carlotta Grisi, Eleanor, Nymph, Delight, and Newington Beauty; 2d, Mr. Ritchie, for Adela Villiers, Cerito, Flora MacIvor, Delight, Climax, and Pauline. Messrs. Dickson and Co. sent greenhouse plants, and a basket of Alpines. Messrs. Dickson and Sons, Exotic plants, including Mimulus sibiricus, Gloxinia grandis, &c. Greenhouse plants from Mr. Carstairs, consisted of Geraniums, Heaths, Rhododendrons, Cinerarias, and Epacrises; also a Giant Asparagus. Mr. Stark exhibited Cheiranthus Marshallianus, &c. Messrs. Downie and Laird two boxes of Cinerarias and Pansies. Mr. Methven contributed hybrid Rhododendrons; and Mr. Mackintosh two plants of Pimelea spectabilis. From Messrs. Ballantyne were herbaceous plants and cut Tulips, together with the Rose Géant des Batailles. Lady Hay sent Azaleas Lateritia superba, Gledstanesi, Fulgens, &c. Professor Dunbar, Camellia blooms and Rhododendron Dunbarianum. The Society's silver medal was voted to I. Anderson, Esq., for Rhododendron Gibsonii, and he also exhibited cinnamomeum, Nemophila maculata, Aquilegia nepalensis, and a Conifer. Dr. Neill sent the Myrtle-leaved Orange, Alpine plants, including Polemonium pulcherrimum, Saxifraga erosa, Knappia agrostidea, Androsace septentrionalis, &c. Professor Syme, Pentstemon Cobœa, Nemophila maculata, Kennedya inophylla floribunda, and Oranges; also four pots of Keens' Seedling Strawberry. Messrs. Dickson and Turnbull exhibited a scarlet Rhododendron, raised from Himalayan seeds; and C. Cobbold, Esq., sent Aotus gracillima. A certificate of merit was granted to Mr. Baxter, Riccarton, for a fine display of Seedling Border Auriculas. Mr. Pender showed flowering plants of Echinocactus concinnus, with other Cacti, and 12 pots of forced Strawberries, including Keens' Seedling, British Queen, Grove-end Scarlet, and Beehive. Mr. Stirling sent several rare Alpines, with flowering plants of Primula Stewartii, and Houstonia cœrulea.

Royal South London Floricultural, *June* 19.—A few Orchids, several nice collections of Stove and Greenhouse Plants, and some well cultivated Cape Heaths were produced. A whole tent was filled with Pelargoniums, admirably bloomed. Roses in pots were furnished by Mr. Francis, and there were also one or two stands of cut Roses. Among the latter we remarked Mrs. Bosanquet, Proserpine, Archduke Charles, Gigantique, Augustine Mouchelet, Elise Sauvage, Devoniensis, Niphétos, &c., shown as *new Roses!* and as such they received a prize! Pinks were scarce and "out of character." It was too early for them. There were in all, three stands of 24 blooms and three of 12 blooms. In the Nurserymen's Class, Messrs. Norman, of Woolwich, obtained the first prize for Lady Dartmouth, Musqueteer, Harriet, Smith's Goliah, Young's Lady Mildmay, Willmer's Princess Royal, Hilyer's Goliah, Elridge's No. 10, Smith's Diana, Garrett's Alpha, Willmer's Surplus, Hodges' Melona, Henbrey's Rubens, Young's Winchester Rival, White's Warden and Duchess of Kent, Omega, Elridge's Pickwick, Hodges' Gem, Coster's Alfred Morrison, King of Purples, Willmer's Laura, Giddy's Jenny Lind, and Reed's Maryanne.—Among Amateurs, the first prize was won by J. Edwards, Esq., of Holloway. His stand contained Benjamin, Winchester Rival, Morning Star, Rubens, Mrs. Herbert, Laura, Melona, King of Purples, Blackheath Rival, Jenny Lind, Joseph Sturge, and Duchess of Kent. There were no less than 14 stands of Ranunculuses, most of them beautiful productions. Among Nurserymen, Mr. Tyso, of Wallingford, was first, with Festus, Mrs. Neilson, Sabine, Demosthenes, Eliacine, Coronation, Amasis, William Penn, Melange, Kilgour's Queen, Naxara, and Village Maid, &c.—Mr. Franklin was second with Nomius, Rob Roy, Prince Albert, Dr. Franklin, Lord John Russell, Apollo, Mrs. Wyse, Veriatt, Princess Royal, Marshal Soult, Elizabeth, Burns, Nonpareil, Eliza, Annette, Atlas, Charlotte, and Dr. Gardiner. Mr. Hook was third with Parody, Triumphant, Dolphin, Alice Maude, Marshal Soult, Beauty of Suffolk, Rhododendron, Amaryllis, Princess, Mary Queen of Scotts, Milo, Wonder, Catherine, Village Maid, Clarissa, Alexander, Albemarle, and Duchess of Leeds.—In the Amateurs' Class, Mr. Airzee was first with Victory, Claudine, Bijou, President, Jenny Lind, Ferdinand, Herald, Theresa, Jane, Ariel, Miranda, and Britannia, all seedlings of his own, except Herald, which is Lightbody's. In a box of 24 Verbenas from Mr. Smith, of Hornsey, we observed the beautiful varieties Robinson's Defiance, and St. Margaret. Some Pansies were shown, but they were not in good condition. The seedling Pelargonium-fund exhibition took place on this occasion. The prizes awarded were, equal second prizes for Mr. Foster's Gipsy Rival and Mr. Hoyle's Ajax (the former very much like Gipsy Bride), and equal third prizes to Mr. Beck's Incomparable and Mr. Hoyle's Ocellatum. Mr. Bates received a certificate for a pretty bedding variety in the way of luceum roseum, called Hydrangiæflorum. It was dwarf, and apparently a free bloomer.—First Class Certificates were also awarded to the following productions: Verbena Lady of the Lake, and Petunia Attraction, from Mr. Young; fancy Pelargonium, Formosissimum, from Mr. Ayres; ditto, Ada, from Mr. Ambrose; Antirrhinum, Diana, from J. Wooler, Esq.; ditto, Virgin Queen, from Mr. Pawsey; and an extra prize was given to Mr. Layton, of Hammersmith, for Calceolarias.

Garden Memoranda.

Messrs. Rollisson's Nursery, Tooting.—This establishment has long been celebrated for its excellent collection of Cape Heaths. Most of the species are now in full bloom in the open air, under a temporary canvas covering, and to admirers of this charming tribe of plants, a sight of them forms an exquisite treat. Among them we remarked a beautiful variety of ventricosa called v. magnifica, a seedling, we believe, of Mr. Storey's. It is something in the way of v. breviflora, but a *very great* improvement on that variety, both in size and colour. In a frame were some exceedingly dwarf seedlings, obtained chiefly between E. v. coccinea minor and E. Parmentieri. In the extensive collection of Orchids here some good specimens were in flower. They consisted of Dendrobium moschatum, Aerides odoratum, Huntleya violacea, with seven flowers; Oncidium divaricatum and others; and at one end of the house we noticed an apparent variety of the singularly formed Javanese Bolbophyllum Lobbii, with creamy yellow blossoms. In addition to the Orchids, this house also contained a nice group of Pitcher plants, among which N. distillatoria, Rafflesiana, and others, were covered with pitchers. The new Californian Ceanothes—dentatus, papillosus, and rigidus, have wintered safely, on a south west wall here, where the old Ceanothus azureus has been considerably injured. They are now in flower, and beautiful wall shrubs they make, their bright blue blossoms having a lively and cheerful appearanee. Mr. Fortune's Berberis and Pavetta japonica have also wintered out of doors without any protection. Amongst novelties we remarked Æschynanthus candicans, several species of Rogiera, Capanea grandiflora, a plant from which much is expected; a new Siphocampylus called reticulatus, an Allamanda, and a white variety of Campanula nobilis. The shelves of a span-roofed house were entirely occupied with small plants of the beautiful Rhododendron javanicum, raised from imported seeds, and Messrs. Rollisson have some thousands of young plants, just coming through the soil, of the wondrous Sikkim Himalayan Rhododendrons, which in a few years are expected to enhance so much the appearance of our American gardens. Sown in gentle heat on the surface of fine sandy peat, and left uncovered, except by a piece of paper supported on the labels about an inch above the pots, they germinate as freely as Grass seeds. When large enough to handle, they are transplanted into 3-inch pots, and afterwards transferred to a colder situation to harden; if "worked" on R. catawbiense, which makes the best stock for Rhododendrons, we may expect to see their flowers about three years from this time. The Ceylon Rhododendron (R. Rollissonii) has been found to stand the winter here in the open border, but it has not yet flowered; it is known to blossom beautifully in the open air in Cornwall. The Cinnamon Rhododendron has also resisted the frost. Mr. Lod-

diges' Rhododendron robustum occupied a bed in the centre of the nursery, where it has blossomed in a very dwarf state. Its flowers are like those of the campanulate Rhododendron, except that they are more tinged with violet. In another part of the grounds was a Rhododendron named fastuosum, a pretty, hardy, semi-double variety, which remains long in bloom; also the Nepaul Andromeda formosa, which is hardy; Dielytra spectabilis, and a pretty variety of Arbutus, an improvement on A. hybrida. Large Magnolias, 25 years of age, on a west wall, have not flowered well this year, on account of the long severe spring, which has considerably impaired the beauty of many of our hardy plants, even in the most favoured localities. This nursery is about 4 acres in extent, well sheltered by high walls, and contains extensive ranges of glass houses and pits. In addition to the home nursery, there are 20 acres elsewhere, covered with fruit trees, shrubs, &c., and 6 acres with hardy Azaleas, Rhododendrons, and American plants, which are now blooming in perfection.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

As the daylight and sunshine have now arrived at their climax for this season, stove plants which are in a growing state should be supplied with the maximum amount of heat and moisture, that they may the sooner complete their growth, and have a longer period to ripen it in. Water should be freely and frequently sprinkled on every evaporating surface, with a view to counteract the drying effects of the abundant ventilation so indispensable in hot weather. Houses which are not so situated as to receive the first rays of the morning sun should be assisted with fire heat, if necessary, early in the day, that the plants may enjoy the benefit of a high temperature in conjunction with the strong daylight of these summer mornings. Incessant exertions must be made to keep insects in check, particularly red spider; syringing, and washing the walls and hot-water pipes with lime and sulphur, will have the desired effect if the means are perseveringly used. The flowering season of many plants may be retarded by pinching off the earliest flowers, thereby husbanding their strength and inducing them to make a longer season of growth; the latter object may be assisted by means of liquid manure. Forcing pits should now be actively employed in forwarding Achimenes, Gloxinias, Balsams, Cockscombs, Globe Amaranths, and other plants for immediate and autumnal display. Shading and ventilation must now be attended to with watchful anxiety, taking care however not to habituate the plants to an excess of the former, as it is only necessary in strong sunshine.

FORCING DEPARTMENT.

PINERIES.—When the bottom heat is declining, it may be recruited by surfacing the beds with a few inches of new tan; as, independently of its own fermentative power, it absorbs a considerable quantity of heat from the sun, and attracts the roots to the surface, where they revel amongst the new material. In addition to these advantages, it checks evaporation, economises labour in watering, and keeps the roots in a more equable state of moisture during hot weather. The syringe must be freely used every fine afternoon, and the pits shut close for an hour or two, to compensate the plants for the loss by evaporation during the day. VINERIES.—Let the late Vines be supplied with a sufficient amount of heat and moisture to keep them growing at a healthy rate; and do not be fearful of the Grapes ripening too early, as, by the retarding process, nothing is gained except ill-flavoured, badly-coloured berries. Grapes intended to be kept through the winter should be perfectly ripe by the middle of September; and as it is important to the flavour that the ripening process should be gradual, let them be grown briskly till they are beginning to change colour, and then by giving plenty of air, accompanied by heat, they will ripen thoroughly, and hang long upon the Vines without shrivelling. PEACH-HOUSE.—Continue to keep insects in check, using the syringe freely to keep down the red spider, and tobacco smoke to destroy thrips. The foliage must be kept healthy, to ensure success in the crops of this and future seasons. Should mildew make its appearance in the late house, dust the plants with sulphur immediately. MELONS.—Keep up the top temperature, and a bottom heat of 85°, and a moderately moist atmosphere to the successional plants, and give occasional waterings. Those plants which are ripening their crops will require less water and a drier atmosphere. If it be desired to obtain another crop from them, care must be taked that the soil does not become too dry; water should be given to the lower part of the soil, by making holes with a tin tube.

FLOWER GARDEN AND SHRUBBERIES.

The most pressing work at present is that of keeping the place in order. A little pains taken with the walks at this season will be amply repaid by the air of comfort and pleasure which well-kept walks give to any place. The old surface should be loosened a little with a sharp rake, and then receive a slight sprinkling of fresh clean gravel; the best time for the operation is when they are in a medium state between wet and dry, as the roller is then more effective in restoring the hard smooth surface than when the gravel is too dry. In connection with the repairs of the walks, any irregularities in the edges should be put right; and the edgings, whether of Grass or Box, or other evergreen, should be repaired and clipped. This is the best time of all to clip evergreen hedges or edgings, as they have time to make and mature a new growth, while the season is far enough advanced to prevent their growing very materially out of shape. Watch the different annuals as they come into flower, and mark those varieties whose superior habit of growth, size of flower, or brilliancy of colour, make it desirable to procure seed from them; and that these good qualities may be perpetuated in their progeny, destroy inferior ones as soon as they expand their first flower.

HARDY FRUIT GARDEN.

The stopping, thinning, and training of the young Peach and Nectarine shoots must receive the most careful and judicious attention, in order to secure an adequate supply of well ripened fruitful wood of moderate strength. Continue to stop any exuberant shoots, not only on account of the uselessness of the wood they produce, but also that they may not, by monopolising the sap, deprive the fruit of its necessary sustenance. Gross shoots stopped, according to directions given in former Calendars, will have produced several laterals, of which one or two of the most convenient should be selected for laying in, and the rest removed. The stronger of the more moderate-sized shoots should also be stopped, at lengths varying from 12 to 18 inches, according to their strength, and the weaker shoots at from 8 to 12 inches; this stopping will cause many laterals to be produced, but of these one only should be allowed to grow at or near the point of each shoot, with a view to maintain a healthy activity at the roots, and to secure an escape for any superabundant sap. This practice is always beneficial, and in late cold localities particularly so, by causing the energy of the plant to be early directed to the maturing of the wood, and the formation of fruit buds for another season. When shoots are permitted to go on unchecked, they form little except leaf buds, and the trees appear crowded, as if there were too many shoots, when the fault lies in their being allowed to grow too long. The most important point is to allow no more to remain than will be required to fill up the portion of wall allotted to each tree.

KITCHEN GARDEN.

Successions of the Brassica family may be planted upon land which has already been cleared of its former occupants, or intermediately amongst other crops which will shortly be removed, provided that the ground had been well manured previous to the existing crop being planted. The last sowing of Peas should now be made, selecting dwarf varieties, which come earliest into bearing, are of a hardy constitution, and not liable to mildew. Sow Cabbage for Coleworts, Endive for main crop, and make the usual sowings of Radishes, Turnips, Lettuces, Chervil, &c. Attention should be paid to the earthing up of Potatoes, using the three-pronged hack instead of the sharp draw hoe, which it is a common practice to use, although it is liable to cut off the young strings which lie near the surface of the ground. The soil for earthing should be drawn from the centre of the space between the ridges. The earliest crop of Celery now requires partially earthing up. As this crop is for immediate use, it should be earthed up by degrees as it requires it. Carrots, Parsnips, &c., should be thinned, as the perfection of such plants greatly depends on the space allotted to them individually.

FLORISTS' FLOWERS.

DAHLIAS.—Every means must now be taken to encourage their growth; mulch the surface of the soil with rotten manure, afterwards give an abundant supply of weak liquid manure. Place the main supports without delay, to which the young plants may be fastened. Begin to entrap snails &c., prevention at all times being better than cure. Roots of Dandelions will be found an excellent decoy, these should be examined early every morning. Earwigs may be caught, by small bundles of sticks being reared against a hedge or paling, or lying on the ground. These destructive insects, if in the neighbourhood, will resort to them in great numbers. TULIPS.—Offsets will generally be ready to take up, before the main bed; it often happens that they throw their bulb deep into the soil, therefore great care must be taken in raising them, or the trowel or small spade may cut them in two. They must be carefully dried in the shade. We have known a valuable collection of bulbs seriously injured by exposure to the direct rays of the sun. PINKS.—Strike cuttings or pipings; these root readily in light compost, prepared from thoroughly decomposed leaves and sand. The bed should be made in the shade, and the pipings watered, to settle the soil about them, but allowed to get thoroughly dry before the glasses are placed over them. CARNATIONS must be carefully tended; see that no ligatures are too tight, or that the plants get not too dry. Destroy aphis as previously advised.

State of the Weather near London, for the week ending June 20, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 27th 1826—therm. 93 deg.; and the lowest on 25th, 1825—therm. 37 deg.

Notices to Correspondents.

ANACHARIS ALSINASTRUM: *M D.* Can any correspondent oblige her by saying if the above plant may be rooted in a fish bowl with Valisneria spiralis? or whether the growth of the one plant would be injured by the other?

BACK NUMBERS: Full price will be given for Nos. 46 and 47 for 1848, and for No. 49 for 1849.

BEES: *J C* states that the consumption of honey having been much greater in his district (Boston, near Tadcaster, Yorkshire) during the winter than was ever known, namely, from 15 lbs. to 25 lbs., he, as well as many others, negiected (through the idea that they would have plenty) to feed; the consequence was, that most of the bees in one hive perished. The queen left the hive, leaving about 500 bees in, and an entire cessation from labour was the result. On the third day they began working again, and in the course of a fortnight another queen made her appearance; but there was no activity in the hive. He saw the queen leave the hive several times, fly out of sight, and then return to the hive. Fancying she was a young queen, and not fertilised, last Thursday he caught a drone belonging to another hive, and put it to the hive where she was, and to-day (June 18) they are labouring (as far as the number of bees will permit) with great activity. How had he best proceed? Perhaps some correspondent will favour him with information on the subject.—*K K K.* Your hive is too small for your swarm. That is all.—*R B.* There are various modes of weighing hives of bees. The most common way is to lift the hive and its board (after closing the entrance with a piece of cotton wool slightly pushed in) on to a cloth, tying the four corners together, passing the hooks of a steelyard under the knot, and weighing as a truss of hay, and then deducting the supposed weight of the hive and the board. But to ascertain the actual increase or decrease of weight in a given time, it is necessary that the weight of the hive, board, &c., be taken separately, and marked on each article previous to their having been used, or the gross weight taken before commencing the experiment. A pair of patent scales, with a flat plate of 12 or 14 inches square on one side, are perhaps the most handy. Care should be taken to load the weight-pan nearly to the weight of the hive, &c., before placing the hive on the other side, to prevent any jarring to the hive, and also by balancing the scales with the finger till the exact weights are in the scale. *Y.*

BOTANICAL REGISTER: *K L M.* The plants illustrated in the following plates are—304, Cactus speciosus; 369, Diosma hirta; 402, Leucadendron corymbosum; 570, Philadelphus grandiflorus; 615, Amaryllis revoluta; and, 754, Curculigo latifolia.

DEUTZIA: *C Bundy.* The discovery you have made is an old one. The little disks are hairs of a peculiar kind; such structures are very common.

FILBERTS: *Diss.* You have certainly not got the purple-leaved Filbert; the paleness of the leaf renders it doubtful whether you have even the red-skinned Filbert.‖

GLASS: *Iota.* 1, yes; 2, yes; they are very respectable people.

GREEN CENTRE IN ROSES: *W D.* It is not unlikely to have been the sudden changes in the weather that have produced this evil in your case; but any sudden change whatever will effect the disturbance, and some varieties are more liable to it than others. Read the remarks on the subject at p. 171 of our volume for 1847.‡

HEMP: *F R.* We suppose the "Nettle Hemp" to be Urtica cannabina, a common North American plant. If so, it will be found, we fear, that the fibre, though strong, is not durable.

MONSTROUS PLUM: *F D.* It is a curious thing. A woodcut of it is in preparation; when published you will hear our opinion of it.

NAMES OF PLANTS: *Juvenis.* 1, Rhinanthus Crista-galli; 2, Polygala vulgaris; 3, Orchis maculata; 4, Ophioglossum vulgatum. Bentall's botanical paper is what we use.—*P Q.* As what gardeners call Cinerarias are Senecios, it is probable that what you saw called a Cineraria was really one.—*G H.* Apparently a bit of Spiræa sorbifolia.—*J Rogers.* We are unacquainted with the plant, and do not find the name in books. Would you be good enough to send a fair specimen in flower.

PEARS: *Londonderry.* Neither Hacon's Incomparable nor Knight's Monarch is considered longer in bearing than the generality of Pears. Better root-prune your trees.‖

ROADS: *An Irish Sub.* We should knock off the tops of the stones and regravel; but floods will again reduce it to its present state, unless you can make a watercourse to take them off. Cannot you form a loose open edge to the road on each side, lower than the level of the crown, with fragments of stone and coarse gravel, through which the water will soak off? Or cannot you drive channels obliquely into the sides of the banks? It is difficult to say what you can do, without inspecting the place? A clever land-drainer would tell you at once, if you have such a man at hand.

ROSES: *A Subscriber.* The leaves contain no explanation of the cause of their rolling back. They seem healthy and free from insects. Perhaps the appearance is caused by cold.—*Enquirer.* You had better allow the shoots to which you allude to grow on until you remove them from their parent trees in autumn.‡

SLUGS: *Tris.* See our Number for last week, p. 376.‡

SQUIRRELS: *Rusticus* will thank some correspondent to inform him in what way the haunts of squirrels are to be detected in a Fir plantation. Their ravages are most evident, but the woodman has not been able to get sight of them, to shoot them. At what time of the day are they most abroad? Is there any way of destroying them better than by the gun?

THE ELDER: *L.* If you strike the variegated branch, the change of colour will probably be permanent.

VINES: *Const. Reader.* They are attacked by the Vine Mildew (Oidium Tuckeri). Sulphur will kill it if it is applied *the moment the mildew appears.* That is the point.‡

MISC: *Henry.* Sow your Deodar seeds in pure yellow loam, in pans, and place the latter in a cold frame. The "seeds, or stones," of preserved Dates, are not unlikely to germinate.‡

SEEDLING FLOWERS.

CALCEOLARIAS: *W C.* The best is 16, a pretty variety, well formed, smooth, and having a small throat; but the flower is altogether rather small. 15 is good, but hardly round enough. 18 is striking on account of its bright colours; but it is much too large in the throat. The rest are common.*

PANSIES: *G R.* Will you kindly favour us with another bloom of your Fairy Queen? The one sent was too much spoiled, when received, for us to offer any opinion of it.*—*W D.* All perfectly worthless as show flowers.*

PELARGONIUMS: *C J S.* They had fallen to pieces before we received them.*

PETUNIAS: *J Mann.* All inferior to many of the same colours now in cultivation.*

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10	0	0
Clover Manure, do.	11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

LAWES'S PATENT MANURE.

WILLIAM E. RENDLE AND CO., Plymouth, are Mr. Lawes's Wholesale Agents for the Sale of his MANURES, and can supply them at Mr. Lawes's prices, delivered at his Factory, Deptford Creek.—Apply to WILLIAM E. RENDLE and Co., Union-road, Plymouth.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8*s.*, 15*s.*, and 21*s.*, casks inclusive.

PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence: not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2*s.*; rich brown, 2*s.* 9*d.*; greens and light colours 4*s.* per gallon.

G. BELL and Co., 2, Wellington-street, Goswell-street, London.

The Agricultural Gazette.

SATURDAY, JUNE 22, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June 26—Agricultural Society of England.
THURSDAY, — 27—Agricultural Imp. Society of Ireland.
WEDNESDAY, July 3—Agricultural Society of England.
THURSDAY, — 4—Agricultural Imp. Society of Ireland.

GASPARIN, in his *Cours d'Agriculture*, has well remarked that there is no department within the range of scientific inquiry which holds out a richer prospect to industrious, persevering research, than agriculture does at the present time.

Since the days of Sir HUMPHRY DAVY, Chemistry and every other branch of natural philosophy has made such rapid progress, as to be now ready to render the most effectual assistance.

STEPHENS' "Book of the Farm," JOHNSTON'S "Agricultural Chemistry," and other similar works, have diffused amongst farmers a clear knowledge of how far modern science has enabled us to explain the varied practices of our farms; and what is quite as important, these publications also show us in what particulars we require further information.

This is an important step, as all future inquiries into agricultural phenomena have now a definite point to start from. It will yet be some time before the practices of a farm can be laid down as systematically as botany, in LINDLEY'S "Vegetable Kingdom," or as astronomy in HERSCHELL'S writings. But, as we are old enough to remember geology merely a crude, ill-digested, and unarranged string of theories based on a jumble of imperfectly known, and often misunderstood facts, we do not despair of seeing agriculture, like geology, make rapid advances towards greater exactness.

The benefit which is sure to redound to agriculture, when its *principles* shall be thoroughly understood, instead of being a mere collection of empirical practices, built on the good old foundation known as "the rule of thumb," will be as great as the discovery of the compass was to navigation. We are aware that such expectations expose us to ridicule from men who call themselves practical farmers, and who have hitherto prided themselves not a little on their superior discernment in escaping the mistakes of those whom they scornfully designate "book farmers." For by a strange fatuity farmers have generally held themselves tolerably aloof from connection with books; in this respect acting the reverse to the manufacturer. For instance, so valuable does the latter now consider the assistance of chemistry, that it is common to find a small laboratory and a professional chemist attached to the manufactory as systematically as the book-keeper and counting-house. There are two ways by which this prejudice against book learning may be removed from the mind of farmers—the first is, by some obvious good resulting from scientific inquiry. This would of course be effectual so far as it went; and as the last two or three years have furnished us with a notable example in the instance of artificial manures, we quote them as a case exactly in point. It is difficult to estimate the good which must ultimately spring from their use, and as they are entirely the result of the application of the discoveries of chemistry to agriculture, and as they have already attained a degree of perfection such as the good old "rule of thumb" could never of itself have arrived at, the use of artificial manures will do more to remove the prejudices farmers feel against "book learning" than volumes of argument could ever have effected.

Another equally effectual means will be the diffusion of a better education amongst agriculturists. How this is to be done is the difficulty. Model schools and agricultural colleges have been strenuously recommended, and in part acted upon. The Royal Agricultural and Highland Agricultural Societies, by their yearly prizes for the best Essays on agricultural subjects, which, in many cases, must be written by practical farmers, have also contributed, directly by the information thus obtained, and indirectly by the competition thus excited, to spread amongst us a better opinion of "book learning." Farmers' clubs are also contributing their assistance in this onward movement. It was with extreme regret that we observed the proposition of the Highland Society to confer degrees for proficiency in knowledge on matters bearing on agriculture, so unceremoniously knocked on the head by the powers that be. But this subject cannot, must not, be abandoned here, as we are utterly at a loss to know why a privilege freely conceded to scientific bodies should be refused to agricultural societies. We venture to call the attention of the Royal Agricultural Society to the question, as one in which they might, with great benefit, act in concert with the Highland Society.

SHEEP.

THE different localities in which the sheep are used in Britain may be placed under four heads—the low-land situation, the lower highland, and the upper highland grounds, and the highest elevations or the Alpine range. According to these different elevations, Nature has been found to arrange the various kinds and degrees of animal and vegetable life. The low grounds are universally the most fertile; the soil is alluvial, deep, and warm, and being aided by a corresponding geniality of temperature, it produces an herbage that is rich, juicy, and succulent. This herbage being eaten by quadrupeds, it communicates to the bodies and the dispositions of the animals the same qualities of largeness of bulk and of a heavy temperament. It naturally imparts a sluggishness of disposition and a disinclination to wander, as the food is abundant and easily gathered. It also produces an early maturity of growth, and consequently a shorter period of existence. The flesh of these hastily-produced animals is flabby in its nature and loose in the texture, and wants the vigorous firmness that is derived from exercise and a cold exposure. The wool is of excellent quality, as the improvement of it from a state of hair is not so sensible as the flesh to the accompanying influences that affect the quality. It is very long in the staple and abundant in the quantity. Under the name of low grounds are comprehended all the best improved lands that are placed within the range of moderate elevation.

The lower highland grounds comprehend the higher cultivated lands, with a portion of the best natural pastures. The food is more scanty and of an inferior quality as to juicy bulk, and consequently requires animals of a smaller size and more capable of exertion. The soil is not so rich as the lowlands, and the herbage is more scanty; the animal is quicker and produces less wool. But the quality of the flesh and the wool is not lessened by the reduction of the size of the body, for though the food is altered in the most succulent points, the essences that constitute the refined quality are more concentrated, and tend to produce flesh of a more delicate fibre, and a firmer texture. The wool is similarly affected, and is rendered shorter and somewhat more crisp, but little or nothing diminished in value. In both situations that have been mentioned, the supply of winter food is understood to be ample and of first-rate quality.

The third locality is the upper highland grounds, where little winter food is given, by reason of the small extent of cultivation, and where the rigour of the climate is very considerable. The steep formation of the grounds, and the bleak exposure, require an animal of an active undaunted nature, and the herbage, being scanty and poor in quality, would not support an animal of a heavy carcase and lazy habits. This situation is inhabited by a small animal that is active, brisk, and lively, and which can wander in search of its food without enfeebling the body and ruining the constitution. The wool becomes more hairy by reason of the coldness of the exposure.

The fourth and last locality is the highest mountain range, consisting of snowy tops and Alpine valleys. Nature has also provided this sterile region with inhabitants that are suited to the severity of its natural qualities. The few animals that live in these high latitudes are slow in growth and small in bulk, hardy in constitution, and coarse in the hairy covering.

Nature having assorted the kinds and natures of the animals to each particular soil and climate, it remains for the care of man to improve the condition of each species in providing a better maintenance, and in altering the nature of the animal by an alien admixture of blood which is not so far unlike or different in qualities as to unfit the progeny for the circumstances of the situation. Our knowledge of the breeds of sheep that exist in the different localities amounts to the knowing that they were found on the ground, and beyond that bare fact nothing is known whence they came, or how they acquired the distinctive qualities. The present improvements know only one case of alteration by the admission of alien blood, and that mixture was not very distant or unlike in qualities and appearance. The other beneficial alterations have been made by using the native elements, and providing a better maintenance for the improved progeny, which has been produced by breeding from the best forms of animals. The more elevated situations do not admit of any improvement in the animals by change or by a fresh introduction, and a mixture with the better breeds would be wholly unsuitable to the circumstances of the locality.

The rich herbage of the lowland grounds, and the artificial Grasses of the cultivated lands, maintain animals that are large in bulk, heavy in carcase, forward in growth, and rich in flesh and wool. The food being abundant and easily obtained, and the situation being warm, the necessity is not imposed upon the animal of wandering in seach of its meat, or seeking for shelter; the propensity is created and indulged of living at ease, and attaining maturity at an early age. To suit these purposes, under existing circumstances, no breed of sheep has yet been found equal to the improved Leicester, which was got from the natural elements that were found in the localities of richness and warmth, and by improving on the productions of Nature. By acting on the unerring maxim that "like produces like," and the no less necessary maxim of providing an ample maintenance for the feeding of the improved productions, any breed of animals may be improved, and also assisted by being intermingled with the blood of a near alliance of similar qualities, but superior, or different in some communicable point or points, and which may be further improved by the circumstances of the situation. This point demands the chief consideration in breeding animals, viz., that qualities be not introduced that are above the power of being supported by the situations, and where degeneracy must evidently happen in place of improvement. It may be very truly said that no qualities are in existence which the best lands are unable to support; in that case it remains to intermix and blend the qualities, in order to produce a form that possesses a greater number of points of excellence than were previously obtained from. On this principle the Leicester sheep have reached their present excellence, and have maintained superiority against every competitor yet brought against them. The body is formed to produce much weight in a small compass. The offal is proportionally small, which is the first point in every kind of improved breeding. At the same time the intestinal organs are not reduced below the power of performing the necessary functions. The pelt is thin and resilient, and affords a ready promotion to every enlargement. The bone is fine, yet capable of carrying much weight of flesh. The head is small, the eye is pert and lively, and the ear agile and quick in motion. The back of the Leicester sheep is straight and broad, and affords ample room for lateral extension and the curvature of the ribs. The chest is broad and roomy, and allows the ample play of the lungs. The refinement of the whole constitutional organs induces the rapid growth and early maturity of the different parts, which tendency is very powerfully assisted by the circumstances of the situation. As regards the wool, the fibre is fine and long, the quantity is large, and the fleece is high in estimation for the most valuable application of wool.

The conformation and the disposition of the improved Leicester sheep is exactly what the situation requires—a valuable carcase suitable to the richness of the locality, and the speedy maturity of the animal. The disposition of the animal, though it inclines to ease and quietude, is not thoroughly incapable of exertion; on the other hand its activity is fully equal to the circumstances of the locality in which it is most properly placed, on the low natural pastures and the best cultivated grounds. A lighter breed of the animal is found to be very suitable on all lands where Clovers are sown, and in moderately cold latitudes. The animal is by no means delicate, as is by many supposed; but the very thin pelts that are now frequently seen are unfit for any but the very richest and warmest localities. In breeding, very great care must be used that the constitution be not debilitated nor the body enfeebled by breeding from too near affinities, for whatever may be said on the contrary side, the truth shows that the above results do happen from the joining of a close consanguinity. Of all the points in the value of animal life, none is more necessary than a vigour of constitution, in order that every functional organ be capable of performing the part that Nature has assigned to it. The most valuable good loses its worth in being given to an

animal whose intestinal organs are unable fully to assimilate the elements of its composition. This vigour becomes more necessary according to the quality of the food, as it is rich or poor, succulent or wiry. Quiet and rest encourage the secretion of fat, but some exertion is required to stimulate the necessary action of the organic functions even for that purpose.

The chief recommendation of the Leicester sheep is a very great beauty and fulness of form, which contains in the same dimensions a greater weight than any other breed of sheep—a propensity to fatten almost unequalled, and an early maturity of growth that quickly fetches a remunerative value, and a very large diminution in the proportion of offal to the size of the animal. The Leicester breed of sheep have their head long, small, tapering towards the muzzle. The eyes are prominent, quick and lively, but with a quiet placid expression. Ears long and thin, standing backwards, and quick in motion. The neck full and broad at the shoulders, and gradually tapering to the head. The breast broad and full, shoulders broad and round, and no hollow behind them, arm fleshy down to the knee. Bones of the legs small and bare of wool, chest and barrel deep and round, ribs circular from the spine, back straight from the root of the tail to the root of the ears. Quarters and thighs wide and full, legs moderately long, pelt fine and moderately thin, soft and elastic, and covered with a fine wool of medium length. It is precisely the form of a sheep that must be provided with an abundance of food, and is not required to travel far, or to make much exertion in gathering it. It is therefore placed on the very best lands that produce natural pastures, or which are in cultivation and yield artificial Grasses. The more hardy varieties of the breed will thrive under inferior circumstances, both of soil and climate, if the cultivation be good, and where the attention to the animal is proportionate. An abundance of food is most essential in every case.

The animal arrives at maturity in two years, when the female drops lamb, and the castrated males are fit for sale in a fattened state. They may be disposed of even at 14 months. The average weight that is most generally saleable is 18 lbs. per quarter, varying from 15 to 20 lbs. Summer fed animals will reach a much greater weight, 20 to 30 lbs. per quarter, but large weights are not liked, nor are they so generally useful; the quality of the flesh is coarser, and the fat lies in lumps and clusters, and is unpalatable to many tastes. Quick maturities are all of them liable to the objection of the unequal mixture of fat and lean, and of the flesh being less firm than that of slower advancements; and hence the propriety of being used at an early period, before the faulty parts attain a disagreeable pre-eminence. This objection is very much removed by not allowing the age of the Leicester sheep to much exceed the clipping of the second fleece. At that time the precocious growth has not arrived at the full development of the objectionable parts that attend the early maturity of the system.

The second class of grounds are steep and poorer in the quality of the soil than the first — the exposure is considerably colder, and the herbage is more scanty; but if the cultivation be good, and the soil be of medium quality, and the aspect be moderately bleak, the close-woolled hardy variety of the Leicester breed will be very suitable, even though it require a very considerable attention in providing the requisite quantity and quality of good Turnips and Clovers which are essential.

In the southern counties of England, the geological formation is chiefly "chalk," rising into high hills, that are covered with a short herbage, which is generally sweet, from all calcareous substances on which it grows. These grounds require a clever animal, that is capable of climbing the sides of the hills, and in wandering in search of the food which grows more scantily than on the lowland grounds. Accordingly there was found on these downs or Grassy hills a breed of sheep that had been adapted by the continuation of Nature's usage to the circumstances of the locality—smaller in bulk than the lowland productions, more delicate in the fibre, slower in growth, and the wool shorter and less in quality. These qualities have been all impressed by the external circumstances to which the organisation of the body is exposed. The improvement in arable culture soon afforded a better maintenance, by which the size was somewhat increased, and the other qualities correspondingly brought forward. The animals received the name of the "southdown" breed, from the locality where they were found and improved, and are now well known over the United Kingdom.

The animal is smaller than the Leicester breed, and fitted for more exertion. It is consequently adapted for grounds where the food is scarcer, and requires labour to be gathered. It is short-woolled and horn-less; the face is black, or a dark dun colour. Body short, round, and compact. Legs of a medium length, and moderately fine in the bone. Breast wide, deep, and projecting forwards, indicating a good constitution and a disposition to thrive. Twist particularly full. Head small; eye full and bright, but not prominent. Belly well covered with wool, which comes down to the knee and to the hock; the wool short, close, curled, and fine, and free from any projecting fibres. It fetches the highest price of short wools.

The southdown sheep is hardier than the Leicester breed, and adapted for a greater number of soils and situations. It is patient of short keep, and of thick stocking on the ground; the maturity has been made early, and the flesh possesses a quality in the fibre and in the juice and flavour that is equalled by few and exceeded by no animal in Britain. The improvements that have been made in the shape and qualities of the animal have proceeded from using the natural progeny in the best specimens, and without any mixture of foreign blood—the sheep is consequently purely indigenous. In the localities of the second quality, the southdown sheep holds the first place, and it is undecided how far it is inferior, if at all, to the Leicester breed on the very best grounds in Britain. The treatment of the animal, in point of food and exposure, has produced at least two varieties; the one is improved to a degree that suits the best lands in the kingdom; but is still mostly confined to the elevated grounds of the dry formations of South Britain, where the herbage is short and sweet, whether it be cultivated or natural. The coarser variety is used on the more inferior grounds where the Grass is less abundant and grateful, and where the winter food is more scanty. The animal is well adapted for the purpose of folding on the land; and in some particular situations, very great benefits are obtained from the custom.

For the situations now mentioned, the southdown sheep is preferable to the Leicester breed; the animal is smaller and more active in climbing acclivities, and in gathering a more scanty food; the wool is of equal value, and the quality of the flesh is superior. It is adapted for a greater extent and variety of situations, comprehending the whole circle of cultivated grounds, from the very first-rate quality to an altitude that absolutely forbids the use of any lowland sheep.

The third locality that was mentioned is included in the range of the highest cultivation of crops, and the grassy pastures that extend to the beginning of the Alpine range. This elevation exists all over Scotland and the north and west of England, sometimes accompanied with a portion of cultivated grounds, and very often with none at all. This position of pasture ground requires an animal of a medium quality, between the sheep of the lowlands and the goat-like climber of the snowy regions; and it has been most admirably found in the Cheviot breed, so called from the hills of that name which separate England and Scotland, and where the animal was found and yet lives in the original purity. The breed is hornless and wholly white in colour; eye prominent and lively, countenance open and pleasing, ear large and distant from the eye, back straight, ribs round and quarters well proportioned, legs clean and small boned, pelt thin and very thickly covered with short fine wool. The thighs are well covered with muscle and wool down to the knee, and although the wool be rather coarse on the thigh, the quantity very amply compensates for the want of quality. The maturity is complete at the age of three years, when the weight varies from 12 to 15 lbs. per quarter. The flesh is of the first-rate quality. This animal forms one of the most valuable breeds of sheep in Britain. It is very patient of wetness, and resists much cold, and thrives in all situations where the grazing and the shelter are in any way tolerable. And when it is transported to the improved situations no animal is more profitable, as it fattens quickly, and the wool and the flesh bring the highest price. It has been introduced with much success upon the hills of Wales and of the north of Scotland, where the elevations are not the very stormiest, and where a valley pasturage is joined with the range of the hills. The circumstance of some winter keep being given to the animal, has yielded a superior variety of the animal which inhabits the lowland range, and is well qualified to be fattened on the best lands in Britain. A cross-bred animal of much value is got from the Leicester ram and the Cheviot ewe, in which both the flesh and the wool are much improved. This advantage very conveniently occurs in the last year of breeding from the ewes, and before they are fattened for sale. Thus it is seen that the Cheviot breed of sheep are capable of being applied to several useful purposes, than which no greater recommendation can be possessed by any article either animate or inanimate.

The fourth and last locality that was mentioned is the highest elevation of mountainous tracts that are found in Scotland and Wales, and where snows and tempests almost universally prevail. Nature has not left even these inhospitable regions unpeopled or untenanted; sheep were found there as well as on the richest lowlands, and are seen to be impressed with the permanent marks of the external influences to which their organisation is exposed. A black-faced horned breed of sheep was found over the whole of Scotland, and in the north-west counties of England, varied in some cases into varieties wanting horns, and the bodies being dun in colour and the faces mottled. They have perhaps lived in the greatest purity on the Lammermuir hills of the south of Scotland, and in the county of Selkirk, both of which situations are not far removed from the native land of the Cheviot breed, to which they are as dissimilar as can be imagined. How two breeds so very unlike to each other came to inhabit two districts so near in situation, neither history nor tradition has attempted to explain.

This animal is mostly horned, the female, however, being often destitute of horns. The faces and legs are black, or sometimes mottled. The wool is open and long, coarse and shaggy—the hard, crispy feeling lessens its value. The mutton is of first-rate quality, being unequalled in colour and flavour. It is always best in quality when fed on the mountains; the wild and restless nature of the animal renders it very unfit to be fattened in a lowland enclosed country. Much is sent in carcase by steam-boat to London and other large towns.

The crossing of this sheep with any other breed has wholly failed, but the original animal has been very much improved by judicious selection. The best maturity is the age of four years, when the average weight will be about 14 lbs. per quarter. The wool is small in quantity, hairy and coarse, and of little value, but the flesh is excellent, being tender and juicy, and resembling venison in the black colour it assumes. It is much relished by the amateurs in animal flesh.

This breed yet holds the undisputed possession of the highest Alpine pasturage on the mountains of Scotland. The Cheviot breed approaches to the foot of the heathy range, and there stops; it thrives on all green and comparatively low grounds, but cannot advance beyond these limits. And no other breed has yet been found to progress so far and invade the territory of the original tenants. An animal capable of resisting the number and the power of the external influences of the locality will be very rare, if at all to be found; and to raise a new breed from any existing elements to suit the very peculiar circumstances, will be a very difficult if not wholly hopeless attempt, and is very different from the lowland situations, where the opposing circumstances are fewer in number, and less virulent in their nature. In such cases, the sure way to improvement is by working on the existing materials, by means of using the best parts for the purpose of reproduction.

The mountains of North and South Wales have been occupied from time immemorial by a small hardy race of sheep, differing only in the one point of the northern animals being mostly polled, and in the south they are generally horned. But both kinds are often intermixed, and many are found varying in colour between a dirty white and a perfect black. The head is small, neck long, erect, and delicate; the fore-quarters light, with narrow breast and shoulders; sides flat; the back and loins narrow; legs slight and long; the animals possess much agility and a very unquiet habit, and are very troublesome when confined in enclosures. The fleece seldom weighs above 2 lbs.; it is coarse in quality, and brings a very inferior price. The mutton is uncommonly fine, delicate in fibre, rich in flavour, it always commands a higher price, and a large quantity of it is sent to London in carcase. From the irreclaimable disposition to wander, and other causes, the breeding of the genuine Welch sheep has never been pursued in England, and they are still confined to their native mountains, where no other breed has yet been found that is so well adapted to the climate and the herbage. In the situations that possess a valley pasturage along with a midway mountain range, the Cheviot breed has been introduced, and successfully, but on the unmixed Alpine range of the highest mountains the aboriginal breed yet most firmly hold their ground. The animals may be very much improved in quality by a judicious selection in breeding from the best forms, though it is questionable if any increase in the size of the carcase would be advisable. The wethers require full four years to arrive at maturity, and then weigh 40 to 50 lbs. at an average. The mutton is much best in quality when fed on the mountains.

In improving any breed of animals, or in producing a new breed from the consorting of elements that are dissimilar, but which retain the permanent qualities, the difference in the natural properties must not be very great, or the gap will be much too wide, and may never be filled up, so as to produce a beneficial meeting of the extremes of separation. Animals that are bred on the ground possess a most prodigious advantage over any foreign introduction, and it requires a very considerable time to reconcile and inure the constitution of animal life to the circumstances of external influence. The latter power very often proves too strong to be withstood by the organisation of the elemental structure, and totally destroys the hopes that were entertained of a beneficial change. The failures of new introductions that have been made either in the whole animal or by bringing forward more refined elements in a definite degree, have arisen from the ignorance and neglect of the considerations that are due to the obstacles which will be met, and the influences that will occur. The Leicester sheep has been produced by consorting elements that were exposed to similar affections, and which when joined and mutually refined, were capable of withstanding the circumstances under which they would be used in the same situations. The southdown breed has been got by using the best elements of the native locality without any foreign blood; and in proportion as the animal was improved, the maintenance was also changed into a greater supply, and of better quality, by means of the improvements in arable cultivation. It is a fixed law that animals which are improved in quality require a corresponding degree of better maintenance, and this truth should always strictly be borne in mind in the attempts to improve the structure of animals. If the good be deficient in quantity and quality, the properties of the animal will tend to accommodate themselves to the quality of the nutriment, and the tendency will be further aided by the external agency of the exposure. These most certain truths will ever direct the success or failure of the introduction of the Leicester and southdown sheep, into any strange locality. Constant wetness rather than cold is pernicious to sheep, and more so than the food that is eaten. This property of the climate claims much consideration, and the next is the capability of the soil to produce the necessary food. If these two qualities cannot exist in the necessary degree, the attempt should not be made.

The localities of the cheviot, black-faced, and Welsh breeds of sheep, do not admit the introduction of any

foreign elements of better quality, which are wholly alien to the circumstances of the situation. They would dwindle into insignificance, and speedily disappear altogether. The only improvement that can be made, is by choosing the best qualities for the purpose of perpetuation in the progeny. These refinements are the offspring of the locality, are inured to its influences, and are capable of living under its laws. But even in this case there is a danger of overstepping the power of the nutriment to support the improved organism, and very considerable judgment is required in operating in this way, as the situation does not admit the aliment being improved by cultivation. *J. D.*

Home Correspondence.

Ireland: Potato Planting and Prospects in Mayo, June 8th, 1850.—Up to the present time I had not been in a position to send you such a report of our Potato planting and prospects as deserved to be relied upon. And what I now send you is but an instalment of what you might expect, and what I am resolved to give as time and other circumstances will permit. In no county in Ireland, where so many anomalies exist, are they so visible as in Mayo, once called by the great Irish chief "the fag-end of Ireland." In some places where the soil is naturally fertile to an extraordinary degree, you would not for miles see an acre of Potatoes planted, nor of anything else sown or planted, nor a house, cabin, or living biped of any sort, save an occasional poor-rate or cess collector, searching for quadrupeds to seize for rates, and in the majority of such cases the only quadrupeds now to be found are the hares and foxes, not so readily seized on in the absence of hounds and horses; they, too, having gone "the way of all flesh." In other places where the land is what is called poor, such as the barony from which I write this, and portions of some of the baronies adjoining it, it can be truly said that never in any one year since the creation has there been so much Potatoes planted, so much corn sowed, or the land so well or so extensively tilled as at the present time; and I will further add, the rents were never better paid, though increased instead of being diminished in amount. This will make some of your readers at this and your own side of St. George's Channel stare, perhaps in doubt of the truth of my statement; but such is the fact, the why and wherefore I hope to show when I come to discuss the causes—the effects are well known of this anomalous state of things in the always notorious county Mayo. But to the Potato question. Of the amount of land planted all over the county, no one can form anything like a correct estimate beyond the fortunate districts to which I have just alluded, and in these they are as I tell you. Prices in the towns of Ballaghaderreen, Newtown Dillon (a town which has sprung up within the last three years, and has swallowed up its next door neighbour, Bellaghy, on the edge of the county Sligo), Swinford, Kiltermagh, Clanemorris, Bally Hauris, Kilkelly, and others of that stamp, they have been all through the season from 1*s.* 6*d.* to 3*s.* 6*d.* per cwt. of 112 lbs.; and from those towns much of the counties of Sligo, Galway, Roscommon, Leitrim, and parts of Longford and Westmeath have been supplied with what is termed "seed;" and were it not for the demand from these outskirts, the prices would have been from 6*d.* to 2*s.* per cwt. in several of the towns I have noted here. Present appearances of the crops: In most places forward overground, rank, rich, luxuriant, and healthy in appearance; that is, according to the ordinarily received opinion, but in my opinion they are too much so; and mind I tell you so now, though I may probably have another tale to tell hereafter, but perhaps I should not anticipate evil. The crops though, as I describe them, are thin in plants, as in many places the tubers, provincially termed "slits," or "schkillawns," have perished from a dry rot, such as scourged many parts of Ireland between the years 1830 and 1840. This dry rot has in many places (in which its effects are now visible), destroyed from one-eighth to one-half the tubers planted, and its effects will, I fear, be the same on the lately planted crops not yet overground. I was surprised to see, in the letter of one of your Irish correspondents, the following given *ex cathedra*: "All the judicious proprietors and others are getting rid of the population as speedily and quietly as they can, and laying down all their land to sheep and cattle pasture. Cultivation will not pay here now." I can write it thus: "All injudicious proprietors and others are getting rid of the population unscrupulously, and leaving their lands to grow weeds, having no means left to stock them. Notwithstanding that, it is by good tillage they should and can hope to keep the country from ruin; for good pay and middling tillage will pay here now, as it has paid and is paying all sensible men who hold land on fair terms." *Edward Carroll, Friar's-hill, Ballaghaderreen, co. Mayo.*

Lammermuir Shepherd's Wages.—In printing our note of the wages of a Lammermiur shepherd, you ask if we give no money at all? None whatever. There are considerable differences in the number of sheep and other things given, and we gave the list referred to as being something like an average; but in no instance that we are aware of, is any money paid. To many, such a practice may seem to savour very strongly of the truck system, but we can refer to the character and status of our herds generally, as being the "aristocracy" of our farm servants. To provide the number of sheep required to make up his pack, a considerable capital is necessary—at least 50*l.* or 60*l.*—and then, none but the steadiest and most active men will do for the business. A farmer will hire his ploughman and other servants in the market, without making any or much enquiry about them, but he never thinks of doing this with his shepherd. He must know something of him before hand. In the merse, most of the farm servants are paid principally in kind, the amount of money wage being very small, only 4*l.* a year. This is called "sheep money"; they at a former period had so many sheep grazed, but as this was attended with many inconveniences, it was commuted to money. Notwithstanding this, we will back our farm servants against those of any district in the kingdom, for respectability and general appearance. Of course, bad managers are to be found everywhere under any system; but to show that it is not between hand and mouth with them all, we know of several in our limited acquaintance, who can show deposit receipts from our chartered banks for considerable sums. We are convinced that the more general adoption of such a system would be attended with great benefit to our farm labourers. Perhaps, Mr. Editor, you may be induced, some day, to open your columns to the discussion of the subject. *A Lammermuir Farmer, June 3.*

Three-course Rotation of Crops.—In one of your recent Numbers you express astonishment at the course of cropping adopted by some north country farmers, *i. e.*, the taking a Wheat crop after a fallow, and following that with an Oat crop; but I think your astonishment will be increased when I inform you that such a course is not only permitted by landlords, or I should rather say landlord's agents, as most of them leave the management of their estates entirely to their agents, and who, being paid a per centage on the rental, are interested in obtaining the highest possible rent, irrespective of the means that the bidder may have to continue longer on his farm than a year or two; and that further by their agreements, the tenants are actually bound to apply not less than two chaldrons of lime per acre each year of fallowing—the nature of the lime being quite various. As this mode of cultivation has been practised for 40 years to my knowledge, you may suppose the *caput mortuum* to which the soil is reduced; and now that such tenants are ruined, the landlords blame free trade for their own inattention and ignorance. Did the landlords or their agents bestow as much knowledge upon their estates as the manufacturers have been compelled to do on their mills, teach their tenants to economise manure and improve it by taking care of it, build them proper buildings to carry on the manufacture of cheese, butter, and beef, and see that their attempts to improve were acted upon, a very different state of things would then arise, and I have no hesitation in saying that 10 per cent. might be realised in following out the design of the great Creator, who sent man into the world to till the ground. *Radix.*

Potato Planting in Ireland, 1850: *Clifden, Kilkenny.*—On close enquiry, I find that the breadth of Potatoes planted in this locality will not materially exceed, on the whole, that of 1849. I was at first disposed to believe that it would be double or at least one and a half, from the fact that more poor persons holding a few roods of land, have planted them, which was not the case heretofore, but I find that farmers in general have planted a much less quantity than in 1849 and 1848. Generally it is thought double the quantity has been planted in Ireland, compared with the years before the Potato rot. In this locality, which is principally a stiff Wheat soil, there are not more than one-fifth planted. The conacre scarcely exists at present, nor is its revival likely, at least for some time. The poor persons alluded to under head of query 1st, are those having small particles of land attached to their cottages, or having scraped some manure together, were given land for it, on which to grow Potatoes. The present price of Potatoes for seed, per cwt., from 5*s.* to 6*s.* *Patrick Blanchfield.*

Dung-heaps.—I quite agree with Mr. Mechi in the opinion expressed at a meeting of the Farmers' Club House, that the days of dung-heaps are being numbered, or that farm-yard dung will be used fresh from below the feet of the cattle, without undergoing any preparation by the fermentative process. I have during my practice had the solid fæces carried to the field, almost in a fresh state, and having no mixture of straw. The dung was laid in drills in the usual way and quantity, and Turnip seed sown on the reversed ridgelets. The crop was very much superior to any part of a 50 acre field, on which were used fermented dung, bones, and guano. The dung was lifted from the door of the cow-shed, in which the animals were tied to stakes. But as animals cannot be kept clean and comfortable without litter, I recommend my old plan of all straws being cut into short lengths by the threshing machinery, which will admit the intimate mixture of the straw, fæces, and urine. And I have ever suggested that all Turnip soils be prepared from a deep winter ploughing, altogether by Finlayson's harrow, and that the farm-yard dung be mixed with the land by the two last workings of the grubber. This mode will preserve the moisture, by moving and pulverising the ground, without turning it up to exposure, which, in the common way, converts lands of any tenacity into a mass of clods. *J. D.*

Steeps for Wheat.—It has become the practice before sowing Wheat, Barley, &c., to steep them in preparations of arsenic, mercury, and other strong poisons, for the purpose of preventing bunt or rust. This has proved highly detrimental to the feathered game, killing them by wholesale. I do not feel convinced that any steep is of much use, but if it is, will you or your correspondents be so kind as to tell me whether some less pernicious mixture, as brine (which I have heard well spoken of), or lime water may not be equally efficacious? or what harmless steep is recommended? I am sure that feathered game consume an immense quantity of insects, particularly wireworm and all sorts of grubs, ants and their eggs; and indeed when they can get insects they will not touch grain. It is therefore the farmers' interest not to grudge them a little grain before the insects appear. I shall be obliged by any information. *H. B. R.* [Float the grain in a strong brine for a few minutes, and after lifting out, let it drain on the floor; afterwards dust newly slaked lime over it, and mix it up till it is dry. Or dissolve about 12 oz. of blue vitriol in water enough to wet 4 bushels of Wheat; and pour the solution on the Wheat as it lies in a heap on the floor and mix well. It will dry spontaneously in half an hour.]

Guano.—The business of preparing cheap guano and cheap artificial manures seems to prosper. I have just visited the warehouse of one of these worthies who has exposed for sale several samples of bone dust, varying in quality from the genuine article to genuine rubbish, completely innocent of bones. He assured us, in confidence, that he sold far the larger quantity of the latter, as "farmers will have it cheap in these bad times." Another of these gentry has issued circulars offering silicate of potash as a top dressing for corn, at 4*l.* per ton. As it consists of broken fire bricks and lime rubbish from his alkali furnaces reduced to powder, we can easily estimate his profits, and cannot sufficiently admire the folly of farmers in purchasing an article for 4*l.*, which could not possibly be manufactured genuine under 10*l.* per ton. *T. L. C.*

Societies.

Highland and Agricultural. — The half-yearly general meeting of the Society was held in the Hall, Albyn-place, on Wednesday, the 12th inst., the Right Hon. Lord Blantyre, one of the Vice-Presidents, in the chair.

Professor Low moved the adoption of the amended bye-law, namely, "That tenant farmers, who are members of any local agricultural association, shall pay an admission, and afterwards annually, in advance, the sum of 10*s.*, with the option and power of redeeming the same by payment of five guineas, as the purchase of a life subscription."—Mr. Maconochie, of Meadowbank, seconded the motion, which was unanimously agreed to.—The Secretary said he had now the pleasure of submitting to the meeting the largest list of candidates for admission ever presented in that hall, namely, 159. Of these, he might mention, 106 were tenant farmers, who took advantage of the new rate, and 53 were gentlemen who came in under the old subscription. *Chemical Department.*—Professor Christison said, he must certainly acknowledge, when he looked to previous scientific investigations, that they did not seem to have been carried on with that direct practical bearing that they ought to have been, when it was considered that this important department was as yet in its infancy. Holding these views, the committee were determined that they would undertake no investigation unless according to the suggestions of skilful agriculturists who were members of the committee; and accordingly no such investigations had been undertaken, except of the kind which he had mentioned. He believed he might mention that, in the next publication of the Society's Transactions, the first efforts of Dr. Anderson's inquiries in this department would be made known. These would embrace analyses of Wheat soils taken from various parts of Scotland, being celebrated for the large quantity and the fine quality of the Wheat grown on them. Another investigation having an important practical bearing was already far advanced, but not so far as to enable Dr. Anderson to produce the result in the next number of the Society's Transactions, namely, what was the cause of the difference in the feeding quality of Turnips grown in low and high situations? He had now to refer to a subject introduced last year, with some degree of despondency, namely, the small amount of the funds contributed to the chemical branch of the Society's operations. He was instructed by the committee to state that, although there had been several contributions in addition to those obtained last year, the number was yet far from being so great as this important branch of the Society would lead them to expect. At the same time, it was but right to state that the committee had not taken any active measures for making their wants known. They wished before doing so, however, to produce some effect by the publication of the valuable results to which he had referred; and he might mention that it was proposed that Dr. Anderson should take the opportunity at the approaching exhibition of the Highland Society in Glasgow, of explaining the principles on which the chemical institution proposed to conduct its business.—Dr. Anderson said, that it only remained for him to report the progress which had been made in the investigations now occupying their attention in the laboratory. One of them, that of the analysis of Wheat soils, which had been made with all possible accuracy and minuteness, was completed, and would appear in the next number of the Transactions. The examination of the Turnips of different districts had extended itself to a very lengthened inquiry, and was being prosecuted with as much rapidity as the very laborious character of the analysis admitted. Another important branch of the work of the laboratory was that of performing analyses of different manures, and other substances, for members of the Society and the public. And in this department, he was glad to say that a considerable increase had taken place—about 130 analyses of different substances having been executed since January last; and, during the same period, nearly 200 letters have been written on the business of the laboratory.—Mr. Finnie, Swanston, said: After another year's experience of the privileges I enjoy from being a subscriber to the chemical department, I am free to state, without the fear of contradiction, that I have been enabled to make my selections of manures and feeding stuffs, upon which I have paid many hundreds of pounds, on more advantageous terms than those who have not availed themselves of the aid of our chemist; and I am more and more satisfied, that without a knowledge of the nature and properties of the materials employed by the agriculturist, it is certain that the results of many of the laborious and expensive processes incident to his daily occupation, must be a matter of mere chance, and thus materially affecting the precariousness of the profits upon which his prosperity depends. No doubt, many farmers celebrated in their profession, never trouble themselves about analysis; but I would ask such the question—whether, when about to expend some hundreds on fertilising or feeding substances, it would not be more satisfactory to know whether the articles they are purchasing are actually the best and cheapest they could obtain in the market, and whether the certainty of being protected against imposition would be dearly purchased at a few shillings per annum. I am

satisfied that often pounds are paid more than what is their comparative value, from neglect of the necessary precaution I have referred to; thus most truly making applicable the remark—"penny wise and pound foolish." Now, when there is such dependence on manufactured manures and feeding stuffs, for I hold that there is no grower of Turnips to any extent, but what will be benefited by the use of no small proportion of those manures in addition to what is made upon the farm; and further, that the facilities for adulteration are so great, and the practice of adulteration had been proved to be so extensive, I cannot conceive how, for one instant, it should be a matter of hesitation on the part of landlords and tenants to aid the Society in maintaining its chemical department on the most efficient footing. We are met by the question—What has chemistry done for agriculture? but that is one of easy solution. Chemistry has been the means of manufacturing manures throughout Great Britain to an extent which absorbs many hundreds of thousands of the agriculturist's money And what, I would ask, would have been our position at the present moment, with an extended cultivation of Turnips, and dependent on a monopoly of the Peruvian guano? Thanks to these manufacturers, we are able, and with success, to keep guano, bones, Rape-cake, &c., upon which we at one time entirely depended, in check. But then, inasmuch as these manufacturers have increased in numbers, and inasmuch as scientific knowledge can alone explain how far their preparations may be relied on, the greater is the need for any farmer having the purity and nature of the substances he employs tested before application; and further, however extended the cultivation of Turnips, there is not an enterprising feeder of live stock but what will acknowledge that he is to a very great degree dependent upon manufactured feeding stuffs; and if made by himself, to test the quality of what he uses. It is fruitless, then, for one moment to contend he can dispense with the aid of the chemist. Were I to mention an advice to my brother farmers, I would say, put yourselves in communication with Dr. Anderson; get him to test the manufactured article you purchase, whether guano, oilcake, or such like, and your wonder and surprise will be, how you have been so long in availing yourselves of so invaluable an auxiliary. I should be guilty of injustice to that gentleman were I not to mention that during this last session I have had calls from some of the pupils attending on his instructions, intending to be practical farmers, and have not failed to profit from conversations I had with them regarding greater economy in the manure of the farm. But it is not only those of my brother farmers who have not availed themselves of the aid of our chemist, who are the only parties who may be said to undervalue the Society's exertions to advance agriculture. We may reasonably include every proprietor who has hitherto withheld his support, as I am not aware of any other way they could more effectually secure the improvement of their estates than by encouraging everything that has a tendency to enlighten their tenantry, not only as to how they may better economise the manure obtainable from the farm, but induce attention, and insure confidence in employing, in addition to it, what will be certain to procure a better crop of Turnip, the valuable reproducer of manure. I do think some sad misapprehension must exist on the part of landlords. It is not, in fact, the interest of enterprising farmers to ask their aid at all to the chemical department. Such will avail themselves of chemistry independent of the Highland Society. But, how, in that case, would their exertions in the cause of agriculture prove beneficial to the general agricultural community? Supposing the Highland Society had no chemist, and a farmer analysed regularly his manures and feeding stuffs, would it be expected he should make his own individual investigations patent to the public? Assuredly not. Worldly prudence is against such a supposition. I would therefore say that if no other argument would prevail, this one alone should secure every landlord in Scotland as a supporter of the chemical department. You will obtain, through means of the chemist's labours, the benefit of those farmers foremost in their profession, and you will bring that knowledge to bear on those most backward. And if you fail to encourage the exertions of enterprising farmers who communicate with the chemist, with the view of the same being made available to the whole community, the time may come that such will retain the knowledge they acquire for their own individual benefit, and an effectual check will thus be given to that free and unreserved publication of all agricultural experience, which is so essential to develop everything that has a tendency to improve the art of agriculture.—Mr. DICKSON, Saughton Mains, said, in corroboration of what my friend, Mr. Finnie, has said regarding the advantages which are derived from the facilities which are now afforded to members for getting correct analyses of the various manures, at a moderate cost, I would just mention that three weeks ago I purchased 25 tons of what seemed to be, from appearance, and what was also warranted to me by the party from whom I purchased it, as the best quality of Peruvian guano; and after sending for two tons, and taking a fair sample, which I had analysed by Dr. Anderson, it was found to contain 41 per cent. of sand, in place of from 2 to 5 per cent., which is the quantity in genuine Peruvian guano. You will at once see that by getting this guano analysed, I made fully 100*l.*, which I would have lost by purchasing sand, at the price of guano. I believe the party from which I purchased the guano—who is highly respectable—to have been quite ignorant of the quality of the stuff he was selling, and that he himself had been cheated, having bought it in London; and I afterwards got from the same person part of a direct cargo to Leith—the quantity of sand in which was only 3 per cent. I am also aware that our secretary, Mr. Hall Maxwell, got a quantity of guano sent to him—also by a highly respectable party—as the best Peruvian, which, on analysis, turned out to contain 38 per cent. of sand. I could adduce other instances, but these are sufficient to show the dangers to which the public are exposed in the purchase of this article, as well as others of a similar nature. As a member of the committee, it is my duty to be cognisant of the state of the subscription list, and I regret to have to corroborate what has been stated as to its insufficiency. The Society, in its efforts to promote this most important object, has not met with that support from the landed proprietors of the country to which it is entitled to look. Not only is the fund thereby decreased, but the moral effect is otherwise injurious. The tenants of a proprietor who withholds his support, naturally infer that he is actuated not so much by a desire to save the trifling subscription required, as by a disapproval of the branch Society's operations. I regret to observe lately, that some gentlemen who have contributed hitherto, have intimated their intention to discontinue their subscriptions; and as I know that there are many valuable investigations in progress, which require a long time and much attention to bring out a result that would be really of value, and which, if done hurriedly, would be useless, I beg these parties to suspend their judgment till there has been a fair opportunity afforded of proving the practical value of this, in my opinion, most important department. The report was then unanimously approved of. *The Show at Glasgow.*—Mr. C. HORNE, of Langwell, said he had the honour to report from the directors, that the arrangements for the show at Glasgow, on the 31st of July and 1st and 2d of August, were in a satisfactory state of advancement. As on former occasions, they had received the ready co-operation and liberal assistance of the Lord Provost and magistrates of Glasgow. The Green had been granted for a show-yard, and a subscription of 200*l.* from the corporation funds; and the Lord Provost and magistrates have taken an active part in the necessary arrangements. The subscriptions from counties embraced in the show are in progress, but the amount could not be estimated, as the lists in many parishes and districts have not yet been received. The directors have acted on the reliance that the subscriptions would justify the very large amount of premiums for which they had pledged the Society. He might notice the very effectual and liberal conduct of the county of Argyll in having raised 200*l.* in support of the show by voluntary assessment. A contract had been entered into for inclosing the show-yard with Messrs. Miller and Bannerman, who performed the work in 1844. The cost would, from the extended accommodation, considerably exceed that of 1844. The banquet, which was under the charge of the Glasgow Committee, had been contracted for. The dinner would be held in the City Hall; and the Duke of Roxburgh, the President of the Society, would preside; and it was hoped that the Duke of Argyll, convener of the local committee, would act as croupier. As on the last two occasions, there will only be one dinner. On the evening of the first day, Dr. Anderson would deliver a lecture on some popular subject connected with agricultural chemistry. It was yet too early to form an estimate of the show, as the entries would not be completed before the 20th; but they anticipated one of the largest exhibitions ever held; and the new feature of a sweepstakes for short-horn bulls had created great interest. It had closed with 25 subscribers, and the prize plate had been ordered. Several applications from local societies had been made for premiums, which the directors had felt compelled to refuse, more upon principle, and in accordance with the rules laid down for such shows, than the amount of the premiums. In order, however, to meet the views of west country breeders, a sweepstakes for Ayrshire bulls had been sanctioned.

Farmers' Clubs.

LONDON: *What is the best mode of securing a heavy crop of Swedes? What is the cost per acre? And what proportion of such cost is chargeable to the succeeding crops in rotation?*—Mr. C. LAWRENCE, of Cirencester, said,

The questions proposed for our evening's discussion embrace matter of such interest and importance to the farmer that we might well have devoted a separate evening to the consideration of each of them. With respect to the first, practice will necessarily vary as much as the soils on which we have to operate. The object in view is to elicit the details of that practice which has been found successful by the more experienced cultivators of various soils, for the instruction of those who have the same materials to work on. The answer to the second question must also, to some extent, depend on similar considerations. It is possible that all may arrive at the same point in resolving the third, however various the soils, and the course of their cultivation. The economy of the root or green crop has become a matter which presses much on the attention of the agriculturist, and demands very careful consideration. Those only who have bestowed most of this on all the details of the subject can correctly appreciate the difficulties which are yet in the way of sound conclusions. We can do little more than explain our own views and the practice we have adopted on a farm, the greater proportion of which consists of a fair depth of soil lying upon the ordinary rubble or stonebrash which overlies the oolite, and the remainder exhibits a greater depth of loam lying upon the Bradford clay. The surface soil is for the most part of an aluminous character, which adheres to the implements in moist weather, and is injured by the treading of animals in that state. The practice we have adopted has, in the course of one rotation, so greatly increased the facility of working, that we have been enabled to dispense with one team out of four. On preparing for any root crop, we cannot too strongly insist on deep tillage as the rule, rarely admitting of exception. This we commence as soon as the Wheat has been carried. We set the first plough as deep as the nature of the surface soil may admit, gradually increasing this depth; we have increased our depth from between 3 and 4 inches to from 6 or 7 for this plough. That is followed by Reid's plough (each plough drawn by a pair of horses), which stirs the subsoil from 5 to 6 inches. Each subsequent furrow slice is laid as roughly as may be on the preceding subsoiled furrow; the entire depth of 12 inches and upwards then receives the benefit of atmospheric influence for the next seven months, especially of frost, that most effective of all pulverisers. The bridle of the first plough is so extended on the off side as to admit of both horses walking on the land, for if the near horse be allowed to walk upon the subsoiled furrow much of the advantage would be lost. Minute subdivision of the soil is material for various reasons. It facilitates the early decomposition of its inorganic or mineral constituents, so beneficial in the first stage of growth of the embryo plant; the temperature of its bed is thereby increased; it also induces the formation of fibrous rather than of tap roots, and thereby a quicker absorption of food by these numerous mouths. The preceding Wheat crop having been thoroughly horse-hoed after the annual weeds had commenced vegetation in the spring, the stubbles are found to be perfectly clean. Under these circumstances, provided there has been frost during the winter, and on hauling over the land since it was ploughed, we find no spring ploughing necessary in ordinary seasons; and that after a few days' dry weather the land will work down with the cultivator and harrows to a fine tilth, in a fit state to be ridged up to receive the manure in the trenches. We have not found it necessary to plough a single field so treated this spring for the root crops of the present season. We would here advert to a common objection urged against deep tillage, which we submit has no foundation, viz., that you bring to the surface an infertile soil. A well-constructed subsoil plough merely loosens the earth through which it passes, and brings nothing to the surface, excepting large stones with which it may come in contact. The first plough, if set deeper than the land has been ploughed before, undoubtedly brings soil for the first time to the surface which, but for the previous subsoiling, it must be admitted would be comparatively ill adapted to the growth of plants, for want of the organic matter which accumulates in the surface soil, and of the inorganic constituents having been set free by the disintegration effected by atmospheric influences. But is it infertile? Excepting only in the cases of alluvial and diluvial deposits, the original composition of the surface and subsoil was identical; they contained the same mineral agents essential to the growth of plants. Furthermore, the immediate subsoil has been enriched by soluble salts, &c., washed down by rains from the manures spread from time to time on the surface, and it speedily becomes fertile from exposure by thorough tillage. If we double the quantity of available soil by deep tillage, the space between our plants may be considerably reduced, and the number may be consequently increased. In fact, by the process recommended we practically increase our acreage on a given area. We will now consider the subject of manure, and the mode of its application, a matter on which we feel as one walking in the dark over ground he has never seen in daylight. Practice has led us to put great faith in manure, the ordinary produce of our farms. Science has taught us that no manure combines so many essential elements of fertility, and has also pointed out to us ample reasons for making and preserving it with great care. We have recently had a sample of manure made in our boxes subjected to careful analysis by Professor Way. You will, perheps, be somewhat surprised to hear that though not one drop of water had ever come in contact with this, other than the urine of the animal, the manure contained 71 per cent. of water. Now, when it is considered that our farm-yard manure of the best description is commonly filled and carted to a heap, and is subsequently filled a second time and carted to its ultimate deposit on the land, containing this large proportion of valueless water; and that so far as bullock feeding goes, the root crop, containing about 90 per cent. of water, is filled and carted to the sheds, we cannot conceive this to be an economical system, and invite the attention of our brother farmers to a review of it. We have hitherto adopted mineral manures drilled in contact with the seed, having found this by experience the best security for an abundant plant, and for carrying it rapidly through the first stage of growth. We believe there is no cheaper or better agent for this purpose than that now in general use—superphosphate of lime in the shape of ground bones, first wetted and dissolved in about one-third their weight of sulphuric acid, diluted with an equal weight of water, to which three parts more of water may be subsequently added. In the latter stages of growth, when the formation of bulb commences, we have observed the plant to flourish more in manures of a different description, containing an abundance of organic, particularly carbonaceous matter, and in nothing better than in carefully preserved farm manure. We therefore apply from 15 to 25 tons of farm manure per acre, according to its quality, laid in the furrows, and then split the ridges over it, and we drill with the seed 4 bushels to the acre of the dissolved bones mixed with 20 bushels of turf ashes. In the case of Mangold Wurzel, we find dibbling insures the most regular plant. We have been pleased to find this practice identical with that recommended in the admirable essays and analyses contributed by Mr. Lawes and Dr. Gilbert to the Transactions of the Royal Agricultural Society, in which the specific action of these manures is clearly explained, and their advantages demonstrated by numerous experiments which appear to have been conducted with unusual care. The results from those experiments are, that the effect of dung is attributable mainly to the large supply of carbonaceous matter which it contains, so congenial to the development of bulb; and that the nitrogenous matter, essential to the growth of corn and all crops the seed of which is the object of cultivation, has very little influence on the production of bulb, the special object of the root crops; that the mineral manures may be most efficiently applied in contact with the seed, and that this is injurious in the case of organic manures, which should be so placed as not to come in contact with the embryo plant until it has developed its powers of feeding, and attained a state of vigour. The experiments of Mr. Lawes are usually interesting and instructive, from the fact of their having been conducted on land previously rendered nearly sterile as respected natural supply of food for the Turnip. This land had been cropped with Wheat, Beans, and Wheat, since it had been manured. It was then sown with Turnips four years successively, without any addition up to the commencement of the experiments recorded. The state to which it had been reduced is best explained by this table.

Seasons.	Produce of Bulb per acre.				Average weight of Bulb in lbs. and 10ths.
	Tons.	cwt.	qrs.	lbs.	
1843	4	3	3	2	0.52
1844	2	4	1	0	0.36
1845	0	13	2	24	0.11

In all these experiments a portion of the field was left unmanured, in order that the effects of the supply of various artificial stimulants should be in each case distinctly shown, as well relatively to each other as to the land unmanured. Those who feel sufficiently interested in this important subject to ascertain the relative effects of a great many specific applications are referred to the Tables in the 8th volume of the Journal of the Royal Agricultural Society. We will now only mention three selected results from those Tables in confirmation of the practice we have ventured to recommend, founded on our own observation:

	Bulb per acre.				Average weight of Bulbs in lbs. and 10ths.	Number of plants p. acre.
	Tns.	cwt.	qrs.	lbs.		
Unmanured	0	13	2	24	0.11	13,296
Mean by purely mineral manure	12	8	2	3	1.16	23,882
Farm-yard dung	17	0	3	6	1.61	23.731

All Mr. Lawes' experiments clearly show the superior efficacy of mineral manures in establishing plant, and of organic manures in carrying it forward, and promoting the formation of bulb. Before we leave the subject of manuring, we would suggest, as a matter for future consideration and discussion, whether, on a four-course shift, the usual practice of applying the manure to the root crop is at the most advantageous period. It must be borne in mind that ordinary manure, from well fed animals, made and preserved on the best principles, contains much nitrogenous matter as well as phosphates and carbonaceous matter; that the former is calculated to produce exuberant top rather than bulb, and is supposed to be the most important agent in the nutrition of the cereal crops, though it is generally deemed ineligible by the most scientific agriculturists to employ it immediately to those crops; and that after the cereal crop has appropriated from such manure its most essential food, the carbonaceous food most suited for the Turnip remains. Would not these considerations rather indicate the seeds as the crop in the rotation on which the manure might be applied with the best effect on the whole? Mr. Garrett having enabled us by his admirable implement to hoe from 8 to 10 acres a day with one horse, in the most effective manner, we strongly urge the frequent repetition of this process; and that though the land may be perfectly clean, for we believe it is impossible to overrate the value of the influence of this tillage in rendering the soil readily accessible to those influences which contribute so materially to the formation and extension of roots. After the final hoeing, if from wet weather or other causes the intervals between the ridges have become hard or close, we recommend a turn with a small implement having three tines slightly carried forwards, one in front and two behind, something after the fashion of the Ducie cultivator on a small scale, drawn by one horse, which stirs the soil 3 or 4 inches deep. This treatment produced a crop of Swedes in 1848, which weighed 24 tons per acre, on an impoverished field, which had never been previously ploughed more than 3 or 4 inches deep, nor had produced a crop of roots of half that weight. We now proceed to consider the cost of this crop. The elements of this will probably vary more or less in every instance, certainly in various soils and in different seasons. We have heard such a variety of opinions on this point, ranging from 4*l.* to 12*l.* per acre, that we can hardly hope to assign any specific cost which would meet with general concurrence; we will therefore merely state the actual cost according to our own practice and experience. This, amounting to 11*l.* per acre, is the charge in a favourable season, involving no additional ploughings or spring tillage.

Estimate of the Cost of the Root Crop per Acre.

	£	s.	d.
Rents, rates, tithes, and taxes	2	0	0
Interest on capital (12*l.* per acre)...	0	12	0
Ploughing and subsoiling two days, four horses, at 3*s.*	1	4	0
Two men two days, at 1*s.* 8*d.*	0	6	8
Twice harrowing in spring, and rolling...	0	4	0
20 tons of farm manure, and filling	4	0	0
Hauling out and spreading...	0	11	0
Four bushels of bones dissolved in acid...	0	16	6
Double bouting	0	4	0
Drilling and seed	0	6	0
Horsehoing, man and boy	0	1	0
Singling...	0	3	6
Horsehoeing, man and boy, twice	0	2	0
Hand-hoeing the ridges	0	2	6
Pulling, topping, and storing in clamps...	0	8	0
Sundries...	0	3	10
	£11	0	0

It was objected by a farmer to whom this statement had been submitted, and who estimated the expenses at about 7*l.* per acre, that the item for manure, excepting as respects the hauling, ought not to form an item of charge, unless the manure were actually purchased, assuming that every farm ought to produce its own manure. In these days, however, we presume farmers to keep accounts. If so, the cattle will be debited with their prime cost, with the food they consume, and the beds they lie on; when sold, that account will be credited with the sale price, and the value of the manure left behind to the debit of the root crop. Mr. Huxtable estimated this cost on a different principle, on which he states the cost at 5*l.* 12*s.* 4*d.* Assuming his mode of getting at the motive power per acre to be correct, we cannot agree with him in considering 1*l.* 12*s.* per acre for manual labour sufficient, neither can we think he is entitled to take credit for 20 tons of Swedes per acre on land rented at 20*s.*, at the cost of 20*s.* only for manure. We now arrive at the last point in the inquiry, and that which involves by much the greatest difficulty, viz., what portion of the large cost of the root crop is chargeable to the other crops in the rotation? This question has arisen in consequence of the very general conviction that the root crop is not self-remunerative, but forms an essential basis for the other crops in the rotation, and which ought therefore to be charged with some portion of the cost. It is an axiom in Norfolk that a ton of Swedes will make a stone of beef. Assuming a crop of 20 tons to the acre, and 6*d.* per lb. for beef, this would only give 4*l.* per acre. We have seen some experiments recorded on feeding sheep which seem to prove that we cannot, on Swedes alone, get more than 3*s.* worth of mutton from a ton of roots. This upon our assumed produce would not return a third of the cost. Authorities may be adduced, founded on carefully conducted experiments too, for any feeding value of the root crop from nothing to 10*s.* per ton and upwards. Excluding from our consideration instances in some parts of Scotland, where the value of the Swede crop is clearly ascertained by letting the crop for feed to Highland flockmasters, and those cases in which roots are grown for the supply of London and other large towns, after examining a great number of experiments and calculations, we are inclined to think, under favourable circumstances, the feeding value of a good crop of roots may be put at 5*s.* a ton, or 5*l.* an acre. What is the value of the manure left on the farm for the succeeding crops by the consumption of the roots alone (for we are not entitled to take into account for our present purpose the excreta, liquid and solid, of the hay, straw, and other feeding stuffs consumed by the animals, nor the straw with which they have been littered)? The analyses, which have been published of the Swede, and especially the papers of Mr. Lawes, supply us with the data for an approximate estimate. We all know that nitrogen is a very important agent to the full development of the cereal crops which follow in the course, however little we as yet know of its specific operation. It is a very curious fact, clearly demonstrated by the experiments of Mr. Lawes, that increase in the weight of animals bears a direct relation to the quantity of nitrogen consumed in the food up to a certain point, beyond which the proportional effect is lessened. In one experiment a pen of sheep swallowed food which contained 246 lbs. of nitrogen, of which 16¾ lbs. only were carried off in the carcass; while in another case, in which 96 lbs. of nitrogen were swallowed, 15¼ lbs. were carried off. In the former case there was an unusual consumption of highly nitrogenous food—oilcake, linseed, Barley, malt, and Clover. Assuming that all the analyses were correctly performed, it would seem a legitimate inference, that a very large proportion of nitrogen consumed in each case was left in the manure, capable of giving out ammonia in some shape for future fertilisation. From analysis it appears that 20 tons of the bulbs of Swedes contain about 80 lbs. of nitrogen. We may take tops at 5 tons, which would contain about 50 lbs. of these 130 lbs. of nitrogen it has been shown by Mr. Lawes that under ordinary circumstances about one-fifth is carried off by animals fed, leaving four-fifths in the manure, or 104 lbs. of nitrogen, equivalent to something more than 124 lbs. of ammonia. The money value of this, at the usual estimate of 6*d.* per lb., would be 3*l.* 2*s.*, which, if added to our estimate of 5*l.* per acre as the feeding value of the Swede crop, would give a return in money value somewhat under the cost of the crop. We wish it to be clearly understood we give this as the market value of the article, for the present state of knowledge does not justify us in assigning to nitrogen a specific agricultural value. We may, however, confidently state that, in addition to the nitrogen left in the land, the root crop also leaves potash, soda, lime, magnesia, phosphoric and sulphuric acids, and chlorine, with other elements of fertility; and furthermore, that the tillages charged against this crop have a very material influence on the produce of the succeeding crops. We think, therefore, after a careful consideration of the whole subject, we may safely conclude that on well drained land, thoroughly tilled and skilfully manured, the root crop, judiciously consumed, is remunerative, if we stop there and receive from our successor the fair value of the manure arising from its consumption and of the tillages, the benefit of which extends beyond that crop. We submit, therefore, that in the case of the four-field shift the excess of cost beyond the actual return from the animals fed is chargeable in equal parts on the three succeeding crops, none of which upon this system receive any further manuring. Though the remunerative price of Wheat and beef is not the subject for our discussion this evening, some of the calculations of Mr. Huxtable have so much bearing on it, and they have been so generally read and received by the owners of land (the pamphlet having gone through some seven or eight editions within a short period), that a few observations on it may not be deemed irrelevant. Mr. Huxtable has founded—chiefly on the experiments of Mr. Lawes—arithmetical conclusions, which, if demonstrated, would not only resolve the questions under our consideration, but many others which are now perplexing both landlords and tenants. The chemist only undertakes to inform us that certain food contains a given quantity of nitrogen convertible into a fixed quantity of ammonia; but Mr. Huxtable undertakes to give us in figures, the exact quantity of ammonia which will produce a bushel of Wheat or a pound of beef. He appears to have established to his own satisfaction on those data, by simple arithmetic, that Wheat can be grown profitably at 40*s.* a quarter, and beef at 5*d.* per lb. Far be it from us to undervalue the most important aid of science to our pursuit; neither would we in any degree discourage the more ardent spirits (of whom Mr. Huxtable may be considered the type), the pioneers of agriculture, whose onward course indicates to those behind) the bogs and quicksands to be avoided, as well as the ground which may be safely ventured on; but to Mr. Huxtable's position we must say, "Not proven." We know that ammonia is an important agent in vegetation, but we do not as yet know with any certainty from what source plants immediately derive it, nor in what manner it is assimilated by them. Liebig, who would be generally admitted an authority on such a subject, characterises this very course which has been adopted by Mr. Huxtable, in estimating the value of a manure according to the amount of its nitrogen, as quite fallacious; and he adds, that its value does not stand in proportion to its nitrogen. We may safely rely on the laboratory of the chemist for the elements of any compound, and their relative proportions, and we may obtain from his analysis many highly useful indications; but our operations are conducted in the laboratory of nature, whose *modus operandi* is extremely obscure, and often baffles our most elaborate contrivances.—The discussion terminated with the unanimous adoption of the following resolution:—"That the best mode of securing a heavy crop of Swedes is by the use of a fair proportion of farm-yard manure, with the addition of a dressing of some accredited artificial manures, and that the cost per acre will necessarily vary according to circumstances. That as regards the proportion of the expense chargeable to the succeeding crops in rotation, there has not been sufficient information afforded to warrant a positive conclusion, but that it may be estimated at from one-third to one-half."

NEWCASTLE, *Nov.* 3.—Mr. WILLIAM GLOVER, the exemplary Secretary (who always either procures a member to supply a paper, or fills up the gap by writing one himself), read a paper "*On the Cultivation of Strong Clay Soils,*" as follows:

Without attempting minutely to define the strong clay soils, I shall perhaps best describe them as being those on which, as yet, Turnip growing is the exception to the rule. It cannot but seem strange to us all, that whilst Turnip farming has arrived at a perfection of which we may justly be proud, the system of farming on strong clays has scarcely undergone the slightest change since the introduction of Clover 70 or 80 years ago. On strong clays we follow as yet the practice of our grandfathers, nor has the learning of the nineteenth century as yet even suggested an improvement. I shall begin first with the fallow. The foundation of all improvements on such soils is a judicious and thorough system of draining. Without this all other efforts are in vain. But as this subject has already been ably introduced to you, and has also to be brought before you as a prize essay, it is unnecessary for me to say more than that it is absolutely requisite that such soils should be well drained. When this is not done, in addition to the weeds which usually accumulate, there is a constant growth of what is commonly called "water Grass," which naturally increases the labour and expense of a fallow. If the land be not drained, I cannot too strongly urge upon the tenant the necessity of keeping all his ditches clean. They should be attended to the year before the field comes in course for fallow. As a manure, none has yet been found equal to the common farm-yard dung, which is the "mother of money;" but I have seen guano, or prepared bones, where sufficient manure cannot be obtained, applied with good results; and such are much preferable to the thousands of loads of lime which are wasted (though to a much less extent than formerly), by being applied as a fallow dressing upon strong inferior clays. If you have in any corner of your farm an old hedge, covering from five to ten yards of ground in width, I would suggest that it should be burnt, and applied to your fallows—along with perhaps, a smaller quantity of farm-yard manure than usual, or a hundredweight or two per acre of some prepared or other artificial manure. When speaking of these manures, I may remark that for strong clay soils, though invaluable for green crops, they are, I am afraid, not to be depended on for good Wheat crops, or following crops, unless applied along with burnt clay, or, what is still better, a portion of farm-yard manure. I would suggest their application to the use of those farmers who may be at so great a distance from a market town as not to be able to procure any other manure than is made on their farms. It is to farmers in such situations that my observations are most applicable. In all old-going fields, the low headlands often get very high. These I would suggest should be burnt when in the lea furrow. The burning must not be carried on too far, or the clay comes out of the heap like a brick, and, is, consequently, useless. It is difficult, and perhaps impossible, for me to describe this process, but plenty of men can be found who are accustomed to the work, and will do it well for about 10*d.* per yard, the farmer providing them with a few loads of coals to begin the fires, and a few cuttings of hedges to continue them. If any of you should be so fortunate as to have a peat bog in any corner of your farms, it may also be rendered a most valuable addition to your farm, by slightly charring, not burning, like the clay, this substance, which, with the addition of best Peruvian guano, or a good prepared manure, comes neared to farm-yard dung than anything I know. As to Fallow Crops upon strong clays, such as Turnips, &c., I feel convinced that, as far as our present knowledge leads us, they must still be exceptions to the rule. But unquestionably there is a considerable portion of undrained land in this district which is bare-fallowed every fourth year, mucked with 8 or 10 loads of rubbish led from Newcastle streets, and producing 12 or 16 bushels of Wheat per acre, which, if drained, would produce a great change in the character of such soils; but they would undoubtedly require to be high farmed, which can only be done by keeping more stock, and instead of the everlasting corn crops, green crops must be produced, which is a great desideratum in high farming. The cleanest and best fallow, the driest and kindliest field must be selected. The green crops must be stored for consumption at home. They must be economically used, and given with cake or Warnes's Linseed compound, or whatever you can get cheapest, which involves a double profit, for you thus depend, not solely on your corn, but also upon your cattle; and, again, your manure is richer in its fertilising properties, which will enable you to grow more corn, thereby producing more straw, which increases the manure heap, and so augments the breadth of green crops. In speaking of green crops, I do not mean only Turnips, but Italian Rye-grass, Clover, Rye, Mangold Wurzel, Kohl Rabi, &c. However, we have to do with land in its present condition; and I perfectly agree with a gentleman whom I have the pleasure of knowing, and who is undoubtedly one of the best farmers in this district, who, in speaking of our inferior clay soils, says:—"Much has been said upon the folly of allowing one-fourth of the land to lie fallow every year, and I even question if on soils of the best description, where Turnips cannot be eaten on with sheep, that the growth of that root can be persisted in year after year, when the field comes in course for fallow, without a great depreciation of the land. But upon inferior soils the growth of Turnips must be still rarer, or the farmer will most assuredly suffer in his following crops." The Potato is a much less objectionable fallow crop for such lands as we are now speaking of, and I have often seen a better crop of Wheat after it than upon a bare fallow. I am at a loss to understand why this should be the case, as chemical analysis shows us that both the Potato and Turnip remove about the same quantity of inorganic matter from the soil. Beans, Peas, Tares, and such-like have been recommended as fallow crops for strong undrained clays; but I cannot concur in such recommendation, for when I have seen them tried to any extent, they proved, I consider, injurious to the land. Their place on such soils is further on in the rotation. I need not, to a body of practical farmers, tell you that the fallow must be well cleaned; the working with any pinching or niggardliness being here, as in every other case, the worst economy. In some parts of the south of England it is usual to allow the land to lie two winters in fallow, and sow Barley in the spring, Wheat being grown in the Clover lea, which seems to answer very well there; but I have seen on a clay farm of a friend of mine, who adopted this plan, some very indifferent crops. He persisted for some time, but he has now abandoned the system; and I feel convinced that Wheat will rarely do well after Clover in this district, particularly in such soils as we are now discussing. This brings me to the second step in the farming operations of strong clays—the Wheat crop. Notwithstanding that there has lately been a great deal of discussion as to the rotation of soils, I very much question whether there is any better system than—1st, fallow; 2d, Wheat; 3d, Clover; 4th, Oats; or, 1st, fallow; 2d, Wheat; 3d, Clover; 4th, pasture; 5th, Oats; 6th, fallow; 7th, Wheat; 8th, Beans; 9th, fallow, and 10th, Wheat. Indeed, the great difficulty with strong undrained clay is, that we cannot vary our system; the land is not what is called "convertible." The variety of seed which I have observed to succeed best in this district, is the "Old Creeping Wheat;" next comes the "Spalding Prolific." The fine varieties, which have lately been so prominently brought forward, have, in the majority of instances, been, as far as my own observation shows, the source of disappointment upon the soils we are considering. As to quantity of seed to be sown, a great deal of discussion has lately arisen respecting the awful waste perpetrated by the farmer in sowing as much as two bushels, the quantity we were in the habit of sowing broadcast. Wherever I have seen a less quantity sown, in this district, the crop has always suffered (although, by the bye, half a bushel may be saved by drilling). It is true that the Wheat stools out, and appears to do its utmost to occupy the land; but the consequence is, that the crop is very much later in being ripe, which you will agree with me is a matter of importance in this part of the country. Should the quantity of seed be still smaller, the crops suffer in quantity; and as for half a bushel, or even a bushel, no one will try it a second time upon the soil now under discussion. When, by any chance, a crop of Turnips has been grown, Barley generally succeeds better than Wheat; and I must not forget to remark that the Turnips must be pulled off early, and the land ploughed, so as to lie some time before sowing the Barley. It has been recommended to manure the land, before sowing Wheat or Barley (after Turnips), upon strong clay. When this can be done, of course it is a very great advantage; but I have seen when it was a difficulty to get the Turnips off the land, to say nothing about getting manure on. Mr. Robson's mode of ploughing-in the Turnip-tops I think a good one, and would advise you to adopt his plan, for they are almost valueless as food for cattle, but are useful as a manure. The harvesting and securing the Wheat crop scarcely comes within the scope of this discussion. I may, however, remark, that if cut before being quite ripe, the sample is brighter, and in fact much improved; though this must not be carried too far, or the yield suffers. The third step in the rotation we have mentioned is the Clover crop; and of all others this is the most unmanageable. The discussion we recently had on the "Failure of Red Clover," though perhaps eliciting some new suggestions, has not furnished us with any solution of the difficulty. Many farmers in this neighbourhood sow 5 lbs. of broad, 1 lb. of hop, and 1 lb. of white Clover, with half a bushel of Rye-grass, per acre. Others sow Pacey's Perennial Rye-grass, instead of the Rye-grass above mentioned. The advantage of this is, that Pacey's is generally thoroughly clean from the seeds of weeds. It is more expensive than the annual Rye-grass, and the yield of hay is also less. With regard to the Italian Rye-grass, I question if it is at all suitable to our cold clays. I would recommend you to try Cow-grass, a species of perennial Clover, when the land is tired of common Clover. The Cow-grass does not yield so much hay as a good crop of Clover, nor does it give a second crop; but as it grows where common Clover does not, it is on this account extremely valuable. In purchasing Cow-grass, or indeed any seed, none should be purchased but of seedsmen of established character, as it exactly resembles over-year's Clover, which is consequently easily sold at four times its value, to say nothing of the disappointment. I would here just wish to impress upon you to purchase good Grass seeds, whether it be merely for one year's Grass or permanent pasture. A few days ago, when walking over a farm, I heard the tenant express regret at the failure of the Grass which he had sown down for permanent pasture. On viewing the same, I found it had been sown away with very indifferent seeds. On inquiring what Grasses had been sown, I could get no information on this point, but was told, "They cost a sight of money." I asked how much per acre. The answer was, "16*s.*" Now we know it is impossible for any seedsman to sell a mixture of good seeds for permanent Grass for any such sum; and if we will not give a remunerating price, can we wonder at the rubbish that is put into our hands? can we feel surprised at the many failures in laying land down to permanent pasture that are constantly coming to our knowledge? The only way that we are sure of obtaining good seeds is to send a list of such kinds as our experience shows us are suitable for our lands, to such firms as are known to be practical seedsmen and men of established character, upon whom we can place reliance. To proceed with the subject:—With regard to the failure of Clover, I am unable to assign any reason for the misforture—I can perhaps suggest something in palliation. In the first place, the land must be kept in good heart; in the next place, the land should (when drained) be ploughed very deep after the Oat crop; in the third place, Beans, or some other pulse crop, should be grown after Wheat, once in eight years, or at least once in twelve, so as to prevent the Clover crop from recurring so frequently. I am at a loss to account for the beneficial effect of the intervention of the Bean crop, but it is nevertheless true that the interval thus given to the recurrence of the Clover crop is the best preventive of its failure. Upon the poorer classes of undrained strong clay soil, Beans cannot be profitably cultivated, but the Scotch Grey Pea may be grown. It is somewhat singular that this change is not near so effectual in preventing the failure of the broad Clover as Beans. The mottled or partridge Pea does not suit strong clay soils so well as the Scotch Grey Pea, the former being apt to run too much to straw. I would suggest, when possible, that manure should be applied for the Clover crop, as it is no doubt better farming to apply manure in small quantities and often than in large quantities at once. I also think the Clover crop is the part of the rotation of strong clays on which to apply artificial manures. Nitrate of soda, which at one time was highly spoken of, gives a rapid growth, but I believe no increase in the weight of the crop. Guano I have never seen tried; but what we want is some special and judiciously prepared artificial manure for Clover. I now come to the Oat crop, which can be very briefly disposed of; for all that is required is to plough, sow, harrow, and reap; but I should like to see some manure applied also to this crop, for I have already said, and wish to impress upon you, that it is undoubtedly better policy to apply the manure often than all at once. In working the strong clays I think that the implements we have in use in this district are very inefficient, consisting of three:—viz., the plough, the harrow, and the smooth roller. Now I should like to see in the possession of every farmer a Crosskill's roller, which is an invaluable implement, and will pulverise and make fine in a day what would otherwise perhaps take a month. I should also like to see a Ducie's drag, which is admirably adapted for stirring the fallow; it is an implement the utility of which it is very difficult to overrate; it only requires to be seen at work, to be at once convinced of its practical worth. Mr. Robson (who, by the bye, possesses the most complete set of implements of any farmer in this district), has had one in use for some time, and will, I have no doubt, be glad to show it to you in operation. There are several other very useful implements, which only require to be seen at work to convince you of their utility; and we should all endeavour to economise time, which is capital. Every hour in the day we are expending money, paying rent and taxes, interest of capital, wear and tear; therefore we should strive to do all our work with ease and dispatch; and good implements can assist us materially in our labours; and I trust that there are better times in store for the strong clay farmers.—Mr. BROWN observed, as to the difficulty which Mr. Glover felt to account for Wheat being a better crop after Potatoes than a bare fallow, the cause was this—that you applied twice the quantity of manure in the first instance. As to 5 lbs. or 6 lbs. of Clover per acre for laying down land to permanent pasture, he did not consider that quantity to be half sufficient; besides the omission of many other seeds which were most essential for the purpose. He was quite sure that were they to sow a peck of red and white Clover-seed with a full quantity of Rye-grass, it would amply repay them for the extra outlay, if but for one year. It would, for instance, enable the land to carry an extra quantity of stock—say one or two sheep extra per acre—which would more than pay for the additional quantity of seed; and the

land must also be benefited in proportion to the number of stock it carried. With respect to Crosskill's roller, Mr. Brown thought it a good implement under some circumstances—when the land was ploughed out of season: the best way was to prepare it early in the autumn, and one ploughing in the spring, before sowing the Turnips would be sufficient: any clods raised then would be pulverised by the frost. He was no great advocate for rolling.—The CHAIRMAN said, it would be well if some improvements could be suggested, and carried out, in the cultivation of strong clays. There was no land in this district which stood so much in need of improvement. It was, indeed, the only kind of soil that stood still. He found it, himself, the most difficult to manage. It would not pay to cultivate it at the present price of Wheat: there was no rent in it. The better way would perhaps be not to plough it, but let it lie in Grass, until Wheat got to 50*s.* or 52*s.*, and then fallow it out. He could not agree with Mr. Brown that it was owing to the manure that Wheat was of better quality and more abundant after Potatoes. Then with regard to what Mr. Glover had said of seeds, he thought 16*s.* an acre was a good round sum of money for laying the land away to Grass, supposing it to be a free soil. (Mr. G.: No! inferior clay.) Well! that would make some difference.—Mr. BROWN was so far from thinking 16*s.* an acre an exorbitant sum, that he thought it much too little, and would refer the Chairman, first, to Mr. Thornhill's treatise on seeds. Then go to a merchant, and ascertain the price of suitable seeds, and it would be found that the land could not be laid down to permanent Grass, as it should be, for less than 36*s.* or 40*s.* an acre. You must have six or seven sorts, some of them expensive ones, or you would never get a close bottom.—The Chairman said he spoke of free soils, but Mr. Glover checked him, saying he meant clays.—Mr. BROWN could not make any great distinction. The growth might be more free on the one soil than on the other, but to obtain a good permanent Grass you must in either case go to much about the same expense. To get a suitable quantity of Cocksfoot and Crested Dogstail alone would take at least 16*s.* an acre. Turn to Thornhill's specimens of Grass seeds, and if you selected but a few of the best, you would find that 16*s.* an acre was nothing like a sufficient sum for permanent Grass. Some farmers recommend letting the first crop, after being laid to permanent pasture, stand without feeding any kind of stock upon it until it was quite ripe, and then allowing it to shake, as they said, for seeding the ground. He considered this a bad plan. A sufficient quantity of seed should be sown at the first. Nothing, he must say, so much impoverished a soil as letting the plant, whatever it was, run to seed. You might grow corn or Oats for ever, if you did not allow the plant to seed. He never allowed his Grass to go to seed — a hint which he got from the late Mr. Thomas Bates. He would, before sitting down, move a vote of thanks to the Secretary for his paper. Mr. Glover was the life and soul of the Club, and deserved the gratitude of its members. (Applause.)—Mr. ROBERT ORMSTON seconded the motion, and it was carried by acclamation.

Farm Memoranda.

SALTHROP FARM, NEAR SWINDON.—Unlike some professional breeders, Mr. Stratton is a good farmer as well as breeder. His farm, which consists of 900 acres of excellent land, lies partly on the secondary range of hills which succeed the high chalk hills of the North Wiltshire downs, and partly in the vale. The upper land, about 400 acres, is all arable, and consists of a strong marl, which, when well managed, is most productive. The house and homestead are on the hill, and the multitude and size of the Wheat stacks which fill the rick-yard tell both of the fertility of the land and the well-doing of the occupier. Here there is one large yard and several smaller ones occupied by breeding heifers, each of which has a pen to herself, one-half covered over. The greater part of the herd, however, is in the vale, where Mr. Stratton holds 500 acres of Grass land. This part of the farm is managed as a dairy farm with the strictest regard to profit; the breeding department is made not exactly subservient to, but entirely consistent with, the profitableness of the dairy. Its management, which I will proceed to detail, is worthy of imitation by dairy farmers. It should be remarked that so good a system could not be followed out where the farmer has no arable land. The whole of the surplus straw grown on the hill beyond what is used for the stock at the homestead is brought down into the vale and used as litter; and the large quantity of manure thus made is all applied to the Grass land. The fertility of the arable land is well kept up by feeding off roots and green crops with fatting sheep bought for the purpose, as Mr. Stratton does not keep a breeding flock. He divides his herd into an ordinary herd and a selected one. The former is kept at the dairy, and consists at present of 34 cows, which are kept in a yard divided into four or five compartments, each division having a shed for shelter. The yard is enclosed all round, and all the liquid manure is preserved. Above the hill there are some 12 or 14 heifers, which belong to the ordinary herd, which therefore contains altogether about 50 cows. Attached to this yard there are several warm and roomy sheds with outlets for calves, as Mr. Stratton rears all his calves, making steers of such of them as he does not consider good enough to keep for bulls. The selected herd is kept in a separate yard half a mile from the dairy, and consists of about 40 cows and heifers, with calves. Here are all the select calves, the young bulls, and the feeding beasts; and each animal has a separate pen half covered, and a spring of beautifully clear water is carried through every pen, so that each has a constant supply of fresh water. The principal yard has the sheds round three sides, being open towards the south, and there it is protected by a high Thorn hedge, kept high but well pruned, for the express purpose of affording shelter to this yard. Though the accommodation here afforded is very complete, there is nothing very expensive, and even without the landlord's assistance such a yard might be made on most dairy farms with a little management and at a moderate expense by the tenants. The select herd also contribute to the dairy, and the large and well-filled cheese room gives evidence that the herd does its duty. The select herd is composed of first-rate stock, all bred by Mr. Stratton; and their size, shape, touch, coats, and milking qualities, all show accuracy of judgment. Mr. Stratton never keeps a cow unless she is a good milker; and he has also attained all the shape and feeding qualities to which many breeders sacrifice milk-giving power. This is unwise, and is quite unnecessary. The position Mr. Stratton has attained as a breeder, the number of prizes he wins every year sufficiently proves; and he has done all this in the comparatively short period of 12 years. But what to my mind is still more important, he has done it at comparatively little expense, and by means which are within the reach of most dairy farmers. I mean, of course, that observation to be subject to the condition that equal judgment and perseverance with that displayed by Mr. Stratton be exercised. Now, Mr. Stratton has never bought expensive cows. He has kept up his ordinary herd by the purchase of the best heifers he can meet with at the different fairs, but he has always been most careful in the selection of his bulls, and in purchasing them he does not spare his purse. His plan, when he wants a bull, is to spend a month or six weeks in looking over the herds of the different breeders, and selecting an animal likely to suit his purpose. Mr. Stratton is not so particular in buying a bull of great beauty and symmetry, as he is in regarding the character and purity of its blood, and he especially requires that its sire and dam shall be good animals. He is at present using a splendid beast called the Red Duke and a white bull purchased from Earl Ducie. From his ordinary herd thus managed he obtains every year a considerable number of heifer calves, which are taken into the selected herd, and if they turn out to be good milkers, and prove by the calves they produce that they are worthy of the promotion, they are there continued. There is one fine roan cow, now 10 years old, from which many of the best herd are descended, and a two-year-old roan heifer, of which she is the dam, is certainly one of the most perfect animals I ever saw. Her last calf, a roan bull, now about two months old, promises to be something extraordinary. In short, Mr. Stratton's herd deserves to be resorted to by breeders, as, indeed, it largely is; while the smallest dairy farmer may apply to a considerable extent to his own farm the general economy of Mr. Stratton's management. His neighbours are very generally availing themselves of the means his herd affords for improving their stock; and, in fact, the value of well-bred short-horns in the dairy is now very generally admitted in this district. Mr. Stratton's efforts are seconded, as they deserve to be, by his landlord, Mr. Parkinson, of Lincoln's-inn, who is the active trustee and ostensible owner of the property; which, with other considerable farms adjoining, has, within the last few years, been purchased by, or rather on behalf of some unknown person. The tenants have not the slightest notion who is their landlord. If, however, they are all dealt with as Mr. Parkinson deals with Mr. Stratton, they need not be very curious to inquire further for a landlord. He is about to build on Mr. Stratton's farm extensive additional accommodation for his stock, and to drain yearly 250 acres of his farm. This is as it should be. Mr. Stratton has just taken an additional farm at Broad Hinton, from Mr. Parkinson, on which 1000*l.* is at once to be laid out by the landlord. The farm, which years ago I knew very well, is a large and good one, extending to 11,000 acres. Its situation is precisely similar to Salthrop Farm, being about two miles to the west on the same range of hills, and consists of very similar proportions of arable land above the hill, and Grass land in the vale. That his enterprise will be as successful on this farm as at Salthrop I have no doubt, for Mr. Stratton is one of those men who command success, and he has a landlord able and willing to bear his own share of the adventure. In what a different position would English farmers be placed, if landlords, generally did so! how different would be the state of English agriculture! I have been led into giving full details of Mr. Stratton's management of his dairy land, because it is so truly practical and adapted to the means and position of tenant farmers; and the dairy farmers, as a class, have not taken farms beyond their available capitals in anything like the same proportion as the arable land farmers have done. Consequently, if seconded by their landlords, they would be in better condition than many grain farmers, who can only thrive by giving up part of their land or going into smaller farms. But efficient improvement of dairy farms will require considerable outlay by the landlords, as they are required to be drained throughout, and to have proper yards and buildings erected for accommodating their stock. And dairy farm tenants could well afford to pay interest on such outlay, in addition to their present rents; for when the land has been drained, and proper buildings supplied, from one-fifth to one-third more stock might be kept. This is on the assumption that the land is all to remain in pasture as at present, though in most cases the inferior and second-rate pastures should be broken up. This, however, would scarcely be acceptable to many of the present race of dairy farmers. *A Midland Counties Farmer, in the Daily News.*

Miscellaneous.

Exhausted Land and Green Manure.—Now that so many small estates are thrown on hand, mostly in a very exhausted condition, it is desirable to landlords to restore their fertility at the least cost of culture. Farming, in the regular course, will be a losing concern to those not practically acquainted with it; and covering the land with green crops to feed down, requires an outlay, for live stock as well as culture, more than inconvenient to many whose chief income has been their land rental; and with little prospect of an adequate return. Thus some thousands of acres are said to be left, especially in Ireland, without a plough or a hoof. But this outlay may be considerably reduced, and the land equally improved (leaving of course out of the question the precarious return), by fallowing with green manure, to plough down two or three successive crops during the season. A mere list of cheap quick growing plants suited for this purpose would not much avail; but it would be very useful if such of your correspondents who have tried them, would inform us which they have found answer best for restoring impoverished soils. Belgian practice gives Spurry the preference; ploughing down two or three crops one upon another at 10 or 12 weeks' interval. In this country, white Mustard has been found to throw up a rich produce in less than 10 weeks; and appears to have expelled the wireworm. The roots of Rape and Clover have been found very effective. White Lupin seed was imported two years since for this purpose; but I have seen no accounts of its efficacy. In Italy it has been employed for centuries, with the most unequivocal benefit; but the climate may make great difference. Until more satisfactory practical information appears, I will venture to recommend the trial of white Mustard * against Spurry, acre for acre; not only for the apparent quantities thrown up, but for their effect on the quality of the soil. And in addition, a third plot of the two mixed; a method which is found in many other cases to increase the produce and improve the condition of both crops. In this way, much land which the owners cannot conveniently farm or stock, may be brought into condition, in moderate time, and at comparatively small expense. Can you say where Spurry seed may be obtained of good quality, at what price, and how much is sown per acre for green manuring in Belgium? *J. Prideaux, in Plymouth Herald.*

Notices to Correspondents.

PHEASANTS: *R Bosworth* asks for some plan to prevent pheasants eating their own eggs. He has a gold pheasant which lays regularly every other day, and devours the egg as soon as it is dropped. She used to lay from 5 to 6 o'clock in the afternoon, but since he has watched her closely, lays early in the morning. She appears to lay eggs for the express purpose of eating them. [Remove them as soon as laid. Try her with a hard-boiled egg just out of the pot; she may scald her throat and give up the practice for the future.]

WEEDS: *W W R.* No dressing will kill Knapweed that will not kill Grass. Spread them out, or pull them up, when the ground, being moist, the roots will come.

WARTS ON THE UDDER: *W D C.* The only plan is to wait till the cow is dry, and then remove them with the knife. *W. C. S.*

Markets.

COVENT GARDEN, JUNE 22.

Vegetables are abundantly supplied. Strawberries and Hothouse Grapes are both plentiful, and the same may be said of Pine-apples. The supply of Peaches and Nectarines has greatly increased, and they are large and fine. Walnuts and Chestnuts are abundant; Oranges and Lemons sufficient for the demand. Young Carrots and Turnips may be had at from 6d. to 9d. a bunch. Frame Potatoes fetch from 4d. to 6d. per lb. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, and Rhubarb are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Cinerarias, Lily of the Valley, Pinks, Carnations, Rhododendrons, Ranunculuses, and Roses.

FRUITS.

Pine-apples, per lb., 6s to 10s	Lemons, per doz., 1s to 2s
Grapes, hothouse, p. lb., 4s to 8s	Oranges, per doz., 9d to 1s 6d
— Portugal, p. lb., 9d to 1s	— per 100, 5s to 12s
Peaches, per doz., 6s to 18s	Almonds, per peck, 6s
Nectarines, per doz., 6s to 18s	— sweet, per lb., 2s to 3s
Strawberries, p. punn., 6s to 1s 6d	Walnuts, p. 100, 1s 6d to 2s
Cherries, per lb., 2s to 6s	— p. bush., 16s to 24s
Melons, each, 5s to 8s	Nuts, Barcelona, per bush., 20s to 22s
Gooseberries, green, per half sieve, 2s to 3s	— Brazil, p. bsh., 12s to 16s
Apples, kitchen, p. bsh., 4s to 6s	Kent Cobs, 90s to 100s p. 100 lbs

VEGETABLES.

French Beans, p. 100, 1s 6d to 2s 6d	Onions, p. bunch, 2d to 7d
Asparagus, p. bund., 9d to 4s	— Spanish, p. doz., 1s 6d to 4s
Rhubarb, p. bundle, 2d to 4d	Shallots, per lb., 8d to 1s
Cabbages, per doz., 6d to 1s	Garlic, per lb., 4d to 8d
Cauliflowers, p. doz., 2s to 4s	Artichokes, per doz., 3s to 5s
Peas, per sieve, 2s 6d to 4s	Lettuce, Cab., p. sc., 2d to 1s
Greens, per doz., 1s to 1s 6d	— Cos, per score, 6d to 1s
Sorrel, p. bf. sieve, 6d to 9d	Radishes, p. 12 hands, 9d to 1s
Potatoes, per ton, 100s to 200s	Small Salads, p. punn, 2d to 3d
— per cwt., 10s to 12s	Mushrooms, p. pot., 9d to 1s 6d
— per bush., 4s to 6s	Fennel, per bunch, 2d to 3d
— frame, p. lb., 4d to 6d	Savory, per bunch, 2d to 3d
Turnips, per doz. bun., 3s to 6s	Thyme, per bunch, 2d to 3d
Red Beet, per doz., 1s to 2s	Parsley, p. doz. bun., 1s to 2s
Cucumbers, each, 6d to 1s	— Roots, p. bdle., 9d to 1s
Leeks, per bunch, 3d to 4d	Marjoram, per bunch, 3d to 9d
Celery, p. bundle, 1s 6d to 2s	Mint, green, per bunch, 2d
Carrots, per bun., 6d to 10d	Watercress, p. 12 bunch., 6d to 9d
Spinach p. sieve, 1s 6d to 2s	Horse Radish, p. bdl., 1s to 4s

POTATOES.—SOUTHWARK, June 17.

The Committee report that the supply of English Potatoes is finished for this season, but the arrivals from the Continent are so large and trade so heavy, that it has caused less prices to be submitted to. The following are this day's quotations:—York Regents, 60s. to 100s. per ton; Scotch cups, 70s. to 75s.; ditto whites, 50s. to 60s.; Rhenish do., 70s. to 80s.; Belgian do., 50s. to 60s.

HAY.—Per Load of 36 Trusses.

SMITHFIELD, June 20.

Prime Meadow Hay	70s	to	74s	Clover	68s to 84s
Inferior ditto	55		65	New Clover	— —
Rowen	54		60	Straw	24 28
New Hay	—		—		J. COOPER.

Very little doing.

CUMBERLAND MARKET, June 20.

Prime Meadow Hay	70s	to	75s	Inferior	65s to 72s

New Hay	50		60	Straw	26 28
Old Clover	78		84		JOSHUA BAKER.

HOPS.—FRIDAY, June 21.

Messrs. PATTENDEN and SMITH report that the accounts from the plantations state that the bine continues to progress rapidly, but that the fly continues about the same. Duty, 165,000*l.* Market about the same.

* Not black Mustard, which is troublesome to get out of the land. The white is easily eradicated.

SMITHFIELD, Monday, June 17.

The supply of Beasts is larger, consequently trade is slow, and prices on the average are lower. The number of Sheep has also increased; trade is more cheerful than on Friday, but prices are lower than on Monday last. Lamb is a ready sale at rather more money. We have a good supply of Calves; they make about the same as of late. From Holland and Germany there are 350 Beasts, 1180 Sheep, and 173 Calves; from Scotland, 240 Beasts; and 2400 from Norfolk and Suffolk.

					Pigs	...	2	8 — 3	8

Beasts, 3601; Sheep and Lambs, 31,780; Calves, 328; Pigs, 315.

Friday, June 21.

The supply of Beasts is not very large; it however exceeds the demand. Buyers are cautious, owing to the warm weather. Prices are lower. The number of Sheep is very large; they cannot be sold, although there is a disposition to take rather less than we quote. Lamb is, on the average, lower. The supply of Calves is again very large, and Monday's rates cannot be supported. From Germany and Holland there are 104 Beasts, 800 Sheep, and 243 Calves; from Spain, 750 Sheep; and 108 Milch Cows from the home counties.

MARK LANE.

Monday, June 17.—The supply of Wheat from Essex, Kent, and Suffolk to this morning's market was small, and realised at the prices of this day se'nnight. Foreign met rather an improved demand, and a fair business was done at our quotations.—Barley, Beans, and Oats, of fine quality, are each the turn dearer: secondary sorts difficult of disposal.—In the value of Peas we observe no alteration.

Friday, June 21.—The arrivals of all grain this week have been moderate, with the exception of 12,840 qrs. of Wheat from abroad, a large proportion of which, also of Barley and Oats, are in very bad condition, and consequently almost unsaleable. This morning's market was thinly attended, and business circumscribed. A little English Wheat remained unsold late in the day. We do not alter our quotations of any article, but Barley and Oats in good order must be considered the turn dearer.—There is rather more inquiry for Flour, but buyers are unwilling to pay higher prices.—Floating cargoes of Maize are nominally held at the rates of this day week.—Since our report of the 14th inst. the weather has been fine, warm, and genial for the growing crops, which continue to be well reported of. The former value of Wheat has been maintained throughout the kingdom, moderate supplies, with a growing scarcity of French Flour, giving more confidence to the trade. Konigsberg and Dantzic, 15th inst.: Sales have been limited, and prices of Wheat are unaltered. Stettin, 17th inst.: The Wheat market is less animated than it has been, but prices are as last quoted.

Liverpool, Friday, June 21.—At the opening of this day's market holders of Wheat were firm, and in some cases required rather higher prices, but the current rates of Tuesday having been subsequently complied with, sales upon a moderate scale were effected, and for all descriptions of English, Irish, and foreign, therefore, we repeat our last quotations. Although in Barley, Malt, Beans, and Peas little business was apparent, the value of each remained unvaried. Oats and Oatmeal in limited request at late rates. The consumption of Indian Corn is still extensive in Ireland, buyers seeming to pay with reluctance 6d. per qr. under the rates of Tuesday last.

CANTERBURY SETTLEMENT.—NOTICE IS HEREBY GIVEN to PURCHASERS of LAND who are desirous of recommending servants or labourers for free or assisted passages to the Canterbury Settlement, that in order that such passages may be secured in the first ships the necessary recommendation must be sent in without delay. Forms of application may be obtained from the secretary at the offices of the Canterbury Association in Cuckepur-street.—By order of the Committee of Management.

H. F. Alston, Secretary.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

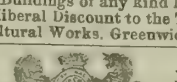
Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

ENORMOUS SAVING! GOING WITH THE TIMES!

HOW TO KEEP A HORSE for less than ONE SHILLING per DAY. The articles and numerous references may be seen, and a list of prices had at Mary Wedlake and Co.'s, 118, Fenchurch-street. A Pamphlet on the above may be had, each (post free) 1s. Also



HOW TO MAKE, Cut, Cart, and Stack HAY, for less than HALF the usual cost, in any county and in any weather.—N.B. A Pamphlet on the above may be had, each (post free) 1s.

A BOON TO THE FARMERS.

FARMERS, be of good cheer, all is not yet lost. Come to us, you will find us ready to meet the times! As you cannot get the same price for your produce, so we cannot expect from you the same price for our IMPLEMENTS, and without first-class manufactured Implements you cannot stand these times! By inclosing two stamps, a list, with illustrations, will be forwarded. Real makers of what they sell.—Most liberal discount for cash.

PORT NATAL, NEW ZEALAND, AUSTRALIA. Emigrants are informed Mary Wedlake and Co. have from time to time supplied the first settlers to Swan River and Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS, and tools of first-rate class. They beg an inspection of their stock.—N.B. Purchasers may have the benefit of an introduction. Most liberal discount for cash.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. Hill, Horticultural Works, Greenwich.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

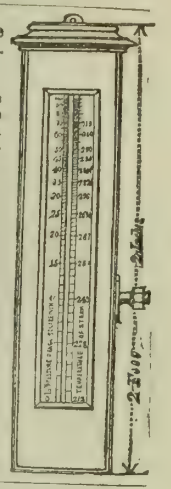
PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1s. 3d. to 1s. 6d. per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7d. to 9d. per foot. HEATING BY HOT WATER.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to Walter Carson, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

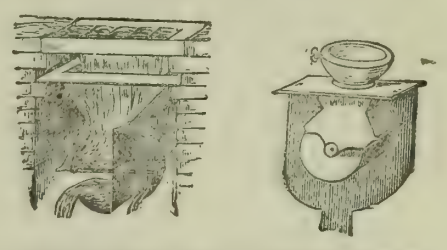


ALEXANDER SHANKS and SON, Machine Makers, Ogilvy-place, Arbroath, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to their IMPROVED GRASS CUTTING ROLLING MACHINE for LAWNS, the completeness of which has now been fully proved. The Machine works with perfect ease, producing a beautiful smooth surface, and attended with a saving of labour of 80 per cent.

A. S. and Son respectfully solicit the attention of the Farmers, Agriculturists, and others to an improved STRAW or HAY CUTTING MACHINE, which they have recently invented. The cheapness and utility of this improved Machine, combined with superior workmanship and durability, enable the inventors confidently to recommend it, as the most profitable Machine of the kind yet sent out. Further particulars and a list of prices may be had, by applying to the makers or to their Agents. Agents for London, Messrs. J. and C. Lee, Nursery and Seedsmen, Hammersmith; Hertford, Mr. George Folkard, Ironmonger; Liverpool, Messrs. Charles D. Young and Co., Castle Buildings, Derby-square; Manchester, Messrs. Francis and James Dickson and Co., Seedsmen, 106, Deansgate; Wakefield, Mr. Wm. Barratt, Nursery and Seedsman, St. Johns; Chester, Messrs. F. and J. Dickson, Nursery and Seedsmen; Glasgow, Messrs. Charles D. Young and Co., 32, St. Enoch-square; Edinburgh, Messrs. Charles D. Young and Co., 48, North Bridge; Perth, Messrs. Dickson and Turnbull, Nursery and Seedsmen.

TO BE DISPOSED OF, the Wholesale Department of an Old and Highly-respectable London Seed Establishment; any one wishing to embark in the trade, or to add to their own business, will find this an opportunity rarely to be met with.—Apply to Messrs. Sturmy and Simpson, 8, Wellington-street, London-bridge.

STEAM BOILER EXPLOSIONS.



HENRY BAKER begs to call the attention of Engineers and Proprietors of Steam Engines to his NEWLY-INVENTED STEAM-GUAGE, Which shows the pressure and temperature of the Steam (it slightly differs from the drawing annexed). This instrument is an ornament to the Engine-room, and supersedes the ordinary Steam-guages in these respects. It is less cumbersome, cheaper, cannot get out of order in carriage, and is warranted accurate. Boiler explosions, in many instances, occur through Steam-guages not being in good working order, therefore every attention should be paid to these very necessary adjuncts.

HENRY BAKER'S STEAM-GUAGES may be fixed in a Counting-house, and will show the pressure the same as if it were fixed in the Engine-room, thereby having a check upon the man working the Engine. Price 2l. 5s., and 2l. 2s.; Vacuum-guages, 3l. 3s. each.

Henry Baker, Barometer, Thermometer, and Philosophical Instrument Maker to the Board of Admiralty, 90, Hatton-garden, London.

TO BUILDERS, &c.
IMPORTANT SANITARY INVENTION.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

C. MARSDEN'S ROTARY WATER-CLOSETS and EFFLUVIA TRAPS, acknowledged by the most scientific to be the best and simplest self-acting Water-Closets and Effluvia Traps ever invented. A stench arises at the time of using all other Water-Closets—with this invention it can be got rid of. It is constructed in the shape of a drum, with four receivers or buckets caused to revolve by the weight of the matters falling into one of the receivers, when it instantly empties itself into the drain or sewer, and another bucket is ready from the opposite side to take its place, and two others on their ascent, to be emptied in their turn, while any upward escape of effluvia during these successive changes is effectually prevented, by overhanging and side flaps of vulcanised India-rubber, so placed that it is impossible to get choked up or get out of order; no balance weight or handles, no D or syphon traps required with these Closets. All traps that require water to keep them air-tight must necessarily leave a sediment to putrify. The value cannot be believed unless seen and tested.—Also Manufacturer of Decorative Marble Paper-hanging.—Waterloo House, Kingsland-road, near the Bridge.

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6s. per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7s. 9d. a set. Sword-scrapers for Gardens, 1s. 2d. each. Patent Fumigators for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. Boobbyer and Co.'s (late Stubch and Boobbyer), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

F. M'NEILL and Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained two Silver Medal Prizes, and is the Felt solely patronised and adopted by

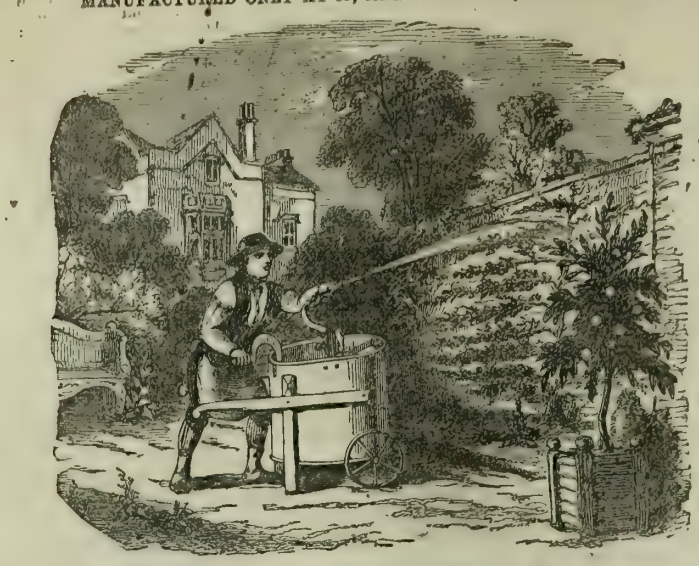
Her Majesty's Woods and Forests,
Honourable Board of Ordnance,
Honourable East India Company,
Honourable Commissioners of Customs,
Her Majesty's Estate, Isle of Wight,
Royal Botanic Gardens, Regent's Park,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the Royal Agricultural Society's House, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

Price One Penny Per Square Foot.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.



☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL and CO.'S Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'Neill and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

Note.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

READ'S NEW PATENT GARDEN ENGINE, MACHINES, AND SYRINGES,
MANUFACTURED ONLY AT 35, REGENT-CIRCUS, PICCADILLY.

THIS ENGINE, which contains about 28 Gallons, will discharge Water in a powerful stream a distance of 50 feet; it is applicable to all Horticultural purposes, particularly for cleansing Wall and Standard Trees from those destructive insects which are so injurious to the young shoots. The value of this Engine is enhanced by the circumstance that its utility is not restricted to the Garden; from its power and portability it will be found of the most essential service in case of Fire. Price 8*l*.

*** Garden Machines and Syringes of every description Manufactured by RICHARD READ, 35, Regent-circus, Piccadilly.

TO THE LADIES THAT TAKE AN INTEREST IN THEIR FLOWER GARDENS, AND WHO DOES NOT?

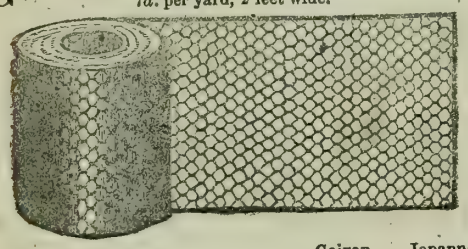
D. FERGUSON, with much pleasure states he can supply them with well-rooted plants, from cold frames, of first-rate Verbenas, Calceolarias, Geraniums, Heliotropes, Fuchsias, Anagallis, Cupheas, Ageratums, Pentstemons, &c., for bedding out, at 1*s*. 6*d*. per dozen, if 5 to 20 dozen are taken; 1*s*. 3*d*. if 20 to 50; above 50, 1*d*. each; and if 100, five dozen will be added: carriage free to London, Birmingham, Leamington, Peterborough, Banbury, Bedford, and all intermediate stations on the North-Western Railway. Lists marked for selection at the above prices, sent free on application: but those not already in possession of a collection, D. F. advises parties to state the colour and quantity they want, and leave the selection to him; and to those who have no convenience for wintering plants, they will find it advantageous to give their annual orders in July or August for the following Spring, as they, on taking five dozen and upwards, will have the choice, not only of those marked in the list, but any other bedding-out plant, if possible to procure, at equally low prices.

Letters directed Buckingham, in place of Aylesbury, reach D. F. one day sooner: where all post-office orders are requested to be made payable.

THE ROYAL WATER LILY.

Preparing for publication, in large folio,

VICTORIA REGIA.



BEAUTIFULLY ILLUSTRATED WITH PLATES,

DRAWN BY MR. FITCH, FROM SPECIMENS NOW IN FLOWER AT SION HOUSE AND KEW GARDENS.

THE DESCRIPTIONS BY SIR W. J. HOOKER, F.R.S.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	¼ in.	⅜ in.	½ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s*. 5*d*.	0*s*. 6*d*.	0*s*. 8*d*.	0*s* 10*d*.	1*s*. 0*d*.	1*s*. 2*d*.	1*s*. 4*d*.	1*s*. 6*d*.
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

ASHBY'S INDIA EXPORT PALE ALE.—London Stores, under the South-Western Railway Terminus, Waterloo-road. India Pale Ale, 21*s*., 18 gallons; 10*s*. 6*d*., 9 gallons; Family Ale, 16*s*., 18 gallons.—CHAS. ASHBY and Co. invite the particular attention of private Families and Clubs to their PALE ALE, as brewed by them for the COLONIAL MARKETS for the past 20 years. Supplied in small casks direct from the Brewery, Staines, and the London Stores, or from their agents—Messrs. W. Hancock, 80, Connaught-terrace, Hyde-park; Chidell and Stewart, 40, Lime-street, City; W. H. Chaplin, 11, Sebbon's-buildings, Upper-street, Islington; J. Shenton, Greenwich; W. Ferguson, Reading; Thos. Berry, Brighton and Lewes; A. J. Richardson and Co., Portsea and Southsea; J. Skidmore, Rickmansworth; Cooksey, Brothers, Southampton.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

PROGRAMME.

THURSDAY, July 11.—Last day of receiving Implements, Seeds, &c., to be exhibited in the Implement-yard, and arranged by the Stewards for the Judges' inspection.

TUESDAY, 16.—Stock received in the Show-yard from Eight in the morning till Four in the afternoon. At Six o'clock in the afternoon (provided the Judges have completed their trials by that hour) Members of Council and Governors of the Society will have the privilege of admission into the Implement-yard at the same rate as the public next day, namely, at 2*s*. 6*d*.

WEDNESDAY, 17.—The Implement-yard open to the public from Eight in the morning till Six in the evening; admission 2*s*. 6*d*. The Judges to inspect the Live Stock and award the Prizes. At One o'clock (or as soon after as all the Judges shall have delivered in their awards) the public to be admitted into the Cattle-yard, on the payment of 10*s*. each person, at the Special Entrance; Members of Council and Governors being admitted by tickets, to be purchased at the Finance Department of the Society, in the Guildhall. N.B.—Notice will be posted up over such entrance when the Judges have completed their awards. At Six o'clock, Professor Simonds's Lecture in the Athenæum, "On the Structure, Functions, and Diseases of the Liver in Domesticated Animals;" at the conclusion of which the awards of the Judges of Live Stock (with the exception of the awards for Horses) will be read.

THURSDAY, 18.—The Cattle and Implement-yards open to the public from Six o'clock in the morning till Two in the afternoon; admission 2*s*. 6*d*.; and from Two till Six in the evening, at 1*s*. The Dinner of the Society in the Great Pavilion (at the extremity of Queen-street) at Four o'clock. Doors open at half-past Three.

FRIDAY, 19.—The Cattle and Implement-yards open to the public from Six o'clock in the morning till Twelve at noon; admission 1*s*. each person. General Meeting of the Members in the Guildhall at Ten o'clock in the forenoon. At Eleven A.M., Mr. Turner will attend and explain to the Members the construction of his Catch-meadows at Barton, near Exeter; and at Three P.M., Sir Thomas Dyke Acland, Bart., M.P., will receive the Members at his Water-meadows, at Killerton, and make arrangements for their due explanation.

The Cattle and Implement Show-yards are situate at Mount Radford, on the eastern side of the city, between the Heavitree and Topsham turnpike-roads, about three quarters of a mile from the Cathedral.

PRESIDENT.
THE MARQUIS OF DOWNSHIRE.

STEWARDS OF DEPARTMENTS.

PAXTON'S FLOWER GARDEN.
Edited by DR. LINDLEY and JOSEPH PAXTON,
And Illustrated by highly finished Plates and Woodcuts.
London: BRADBURY and EVANS, 11, Bouverie-street.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s*. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s*. per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

THERE IS NOTHING BETTER THAN HOLLOWAY'S PILLS FOR BOWEL COMPLAINTS, DIARRHŒA, AND DISORDERED STOMACHS.—Persons subject to these complaints cannot use a finer medicine than these invaluable Pills, and if taken in moderate doses and the diet attended to, a certain cure will be effected. Their strengthening nature speedily renovates the impaired tone of the stomach, and renders the digestive organs more powerful. Bile, and disorders of the liver may be infallibly cured by their use, and those who are suffering from a long residence in hot climates cannot adopt a more effectual remedy than HOLLOWAY'S Pills. They are also the best family medicine extant.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JUNE 22, 1850.

HORTICULTURAL SOCIETY OF LONDON.—HIS GRACE THE DUKE OF DEVONSHIRE, President of the Horticultural Society, has kindly directed the Grounds of Chiswick House to be opened for the reception of the visitors to the Society's Gardens at the next Exhibition, on SATURDAY, the 13th JULY. Tickets are issued to the orders of Fellows of the Society only, at this office, price 5*s*.; or at the Garden, in the afternoon of the 13th July, at 7*s*. 6*d*. each, but then also only to orders signed by Fellows of the Society. But respectable strangers, or residents in the country, who will forward their addresses in writing to the Vice-Secretary, 21, Regent-street, on or before Thursday, the 11th of July, may obtain from that office an authority to procure Tickets on this occasion. No official orders for Tickets will be issued after that day.

N.B.—No Tickets will be issued in Regent-street on the day of Exhibition.

ROYAL BOTANIC SOCIETY, REGENT'S PARK. The Last EXHIBITION THIS SEASON of PLANTS, FLOWERS, AND FRUIT, will take place on WEDNESDAY next, July 3d. Tickets to be obtained at the Gardens, only by orders from Fellows of the Society, price 5*s*. each; or on the day of Exhibition, 7*s* 6*d*.

ROYAL BOTANIC SOCIETY, REGENT'S-PARK, CONVERSAZIONE.—The Fellows of the Society are reminded that the CONVERSAZIONE will be held at the Gardens, on Saturday next, JULY 6th, from 3 to 6 P.M.; also, that if any Fellows of the Society, or their friends, have any subject, either natural or artificial, connected with Botany of sufficient interest to be exhibited, and will kindly inform the Secretary, at the Gardens, they will be sent for, or may be forwarded by carrier, on or before the 5th of July, and will be carefully returned free of expense.

HUGH LOW AND CO. have to offer a fine and extensive collection of CHRYSANTHEMUMS, in strong established plants, including the greater part of the French varieties of last season, at 6*s*., 9*s*., and 12*s*. per dozen; also 10 varieties of the much admired Liliputian Chrysanthemum, raised by Mr. Bonamy, of Toulouse, and sent out last summer for the first time. Price 1*s*. each.

In addition to the above, H. L. and Co. have imported largely the new Continental Verbenas, Phloxes, Fuchsias, &c., a list of which can be had on application.—Clapton Nursery, June 29.

EDWARD DENYER, NURSERYMAN, Loughborough-road, Brixton, within three miles of London, informs his kind patrons in general that his unrivalled Collection of ROSES, reaching to nearly 1000 varieties, are now in bloom and free to the inspection of all visitors, Sundays excepted. Orders taken at this time and executed in November next. Price of Standard Roses, 15*s*. to 20*s*. per dozen. Fruit Trees, &c., &c.

E. D. informs his friends that he has no Seed Shop in London.

HERTFORD ROSE NURSERIES.

E. P. FRANCIS'S New and Extensive Collection of ROSES is now in bloom, and will be in perfection the first and second week in July. The morning and evening are the most favourable parts of the day for seeing them to advantage. The inspection of amateurs is respectfully solicited.

Trains from Bishopsgate Station direct to Hertford.

Hertford, June 29.

CHOICE CINERARIA SEED.

LUCOMBE, PINCE, AND Co. have saved from a select collection of all the newest and finest varieties of 1850, which they have this season grown in great perfection, some Cineraria Seed of excellent quality, and they beg leave to offer it for sale in packets, sealed and warranted by them at 2*s*. 6*d*. and 5*s*. each, free by post; if sown soon strong plants will be produced, which will flower early in 1851.

Exeter Nursery, June 29.

CHOICE SEEDS FOR PRESENT SOWING which can be confidently recommended:

	s.	*d*.
CINERARIA, saved from the best named prize flowers, by a celebrated grower, per paper	1	0
ANTIRRHINUM, saved from a superb collection, per paper	0	5
PINK, saved from named show flowers, per paper ...	1	0
PANSY, from the best show flowers, saved by Thomson and other eminent growers, per paper	1	0
INTERMEDIATE STOCKS, 6 beautiful vars., collection	1	6
GIGANTIC, or BROMPTON STOCKS, 6 bright and distinct colours, collection	1	6
BARNES' EARLY DWARF CABBAGE, per paper ...	0	6
IMPROVED NONPAREIL, or INCOMPARABLE EARLY CABBAGE, per paper	0	6

The above may be had of WM. DENYER, Seedsman and Florist, 82, Gracechurch-street, London.

GRAND HORTICULTURAL AND FLORAL EXHIBITION. Open to all England.

The FIRST EXHIBITION of the LEEDS HORTICULTURAL and FLORAL SOCIETY will take place in the INFIRMARY GARDENS, on the 10th and 11th of July.

Upwards of 100 Guineas will be awarded in Prizes. Cottagers' Prizes, 15*l*. Schedules may be had on application to J. BUCKTON and L. HICKS, Secretaries, Briggate, Leeds.

ROSES.—The Collection at Sawbridgeworth is now in Full Bloom. The Harlow Station of the Eastern Counties Railway is the most convenient for the Nursery.

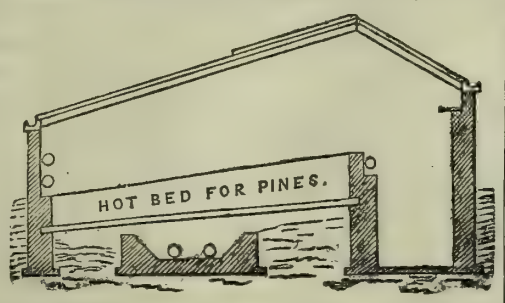
June 29. THOMAS RIVERS.

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's Wood, London, begs to inform the public that he can now supply CINERARIA SEED at 2*s*. 6*d* and 5*s*. per packet, saved this year from all the choice named varieties, which, if sown now, will give the conservatory a very gay appearance next winter. Pre-payment, by stamps or otherwise, is respectfully requested from unknown correspondents.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, June 29.

CARNATIONS AND PICOTEES.—Grand Trial Exhibitions for Northern *versus* Southern raised varieties. Fifty Prizes—70*l*. value.—Schedules for the above Exhibitions may be had upon application to Mr. John Keynes, Salisbury; Mr. John Holland, Middleton; Mr. W. Bragg, Star Nursery, Slough; Messrs. T. Scholefield and Son, Knowsthorpe, near Leeds; Mr. J. F. Wood, Midland Florist, Nottingham; Mr. C. Turner, Royal Nursery, Slough; Mr. T. Dobson, Worton Cottage, Isleworth; Mr. E. S. Dodwell, Derby; the Office of this Paper; and Mr. J. Edwards, Treasurer, Wace Cottage, Holloway.—The Southern Exhibition will be held at the Royal Nursery, Slough, on Thursday, July 25; the Northern in the County Hall, Derby, on Wednesday, August 7.



Subscriptions received by any of the above-named parties.—Each Exhibition is open to all England.

TO STRAWBERRY GROWERS, HORTICULTURISTS, &c.—Those who are desirous of having clean and fine Strawberries are informed that the only effectual method of so securing them is to apply ROBERTS'S PATENT TILES, which protects them from being splashed with dirt during heavy rains, and at the same time greatly improves the flavour and size of the fruit, and secures many advantages over the old plan of cultivation. A Pamphlet, with a description of the Tiles, together with several other appliances for Fruit and Vegetables, can be had by enclosing three postage stamps to Mr. JOHN ROBERTS, 34, Eastcheap, London.

COOPER'S PATENT PRESERVED FRUITS, in Syrup, prepared for the dessert and other uses. A small hamper, containing an assortment of various kinds of fruit, in half-pint jars (hermetically closed), one of which contains Raspberries and Currants the growth of the year 1840, and is still warranted for three years in advance for family purposes. For an order for 7*s*. directed to Mr. JOHN SMITH, 8, St. John-street, Clerkenwell, London, a hamper will be delivered free of expense to any part of London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

DIXON'S NEW (REGISTERED) VENTILATOR.—This Ventilator is much neater and more simple than any hitherto invented, can be made of any shape, or size, and can be as easily cleaned as any other part of a window. It does not interfere with the blinds, or opening of the windows, and if accidentally broken can be repaired by any glazier at the cost of a single pane of glass. Models can be seen, and every information obtained, by applying to the London agents.—JAMES PHILLIPS and Co., 116, Bishopsgate-street, Without.

TO HORTICULTURAL AND FLORICULTURAL SOCIETIES.

BENJAMIN EDGINGTON, Manufacturer to the Horticultural Society, Chiswick, and the Royal Botanic Society, Regent's Park, solicits attention to his stock of Marquees and Tents of every variety, and suitable for all climates. Orders per post duly attended to. Address, BENJAMIN EDGINGTON, 2, Duke-street, Southwark. A Warehouse, 208, Piccadilly.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

PIMLICO SLATE WORKS. — Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS'S Works in North Wales.

ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.

ANTHONY'S PATENT AMERICAN CHURN.—Canterbury Colonists' Rooms, Adelphi.

The Churn was exhibited before a large and respectable body of the colonists, and although the weather was heavy and lowering, and much against butter-making operations, it maintained its well-earned reputation by producing from 3 quarts of cream and 1 quart of sweet milk, 3 lbs. 6 oz. of butter in 12 minutes. The butter being fully prepared in the churn without human hand touching it, was spread on bread and eaten by those present, who expressed themselves delighted with the exhibition.

Kase's Patent American Force and Suction Pump, Ransome's Improved Purifier Canvas Hose, lined with Gutta Percha, &c.

KEY and MITCHELL, 97, Newgate-street, London.

GRAND SCOTTISH FETE, HOLLAND PARK.—The new Iron CATTLE HURDLES used for enclosing the ground on the above occasion, in Lord Holland's Park, at Kensington, will be sold in lots of 20 each, at 3*l.* 18*s.* per score.

Apply to H. MANNING, at the Holborn Iron Works, 251, High Holborn, London. A portion of the Hurdles may be seen in front of the Grand Stand, and at the Manufactory.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long, 13 feet wide, 90*l.*; 21 feet long, 13 feet wide, 50*l.*; 12½ feet long, 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber boxes, Iron hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8*s.*, 15*s.*, and 21*s.*, casks inclusive.

PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence: not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2*s.*; rich brown, 2*s.* 9*d.*; greens and light colours 4*s.* per gallon.

G. BELL and Co., 2, Wellington-street, Goswell-street, London.

AGRICULTURAL DRAINING: THE DERBY LEVEL.—A Very Superior Draining Level, of great simplicity, price 3*l.* 5*s.*, to be had of the Maker, Mr. JOHN DAVIS, Optician, Derby. The above is securely packed and sent to any part of the empire.

ENORMOUS SAVING! GOING WITH THE TIMES!

HOW TO KEEP A HORSE for less than ONE SHILLING per DAY. The articles and numerous references may be seen, and a list of prices had at MARY WEDLAKE and Co.'s, 118, Fenchurch-street. A Pamphlet on the above may be had, each (post free) 1*s.* Also

HOW TO MAKE, Cut, Cart, and Stack HAY, for less than HALF the usual cost, in any county and in any weather.—N.B. A Pamphlet on the above may be had, each (post free) 1*s.*

A BOON TO THE FARMERS.

FARMERS, be of good cheer, all is not yet lost. Come to us, you will find us ready to meet the times!

As you cannot get the same price for your produce, so we cannot expect from you the same price for our IMPLEMENTS, and without first-class manufactured Implements you cannot stand these times! By inclosing two stamps, a list, with illustrations, will be forwarded. Real makers of what they sell.—Most liberal discount for cash.

PORT NATAL, NEW ZEALAND, AUSTRALIA. Emigrants are informed MARY WEDLAKE and Co. have from time to time supplied the first settlers to Swan River and Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS, and tools of first-rate class. They beg an inspection of their stock.—N.B. Purchasers may have the benefit of an introduction. Most liberal discount for cash.

DR. S. NEWINGTON'S HAND-DRILL HOES AND CULTIVATORS, to the frames of which are fitted Coulters for earthing up Potatoes and drawing out furrows for seeds. The chisel-pointed tines have moveable hoeing shares fitted to them, which can be removed when the tines are only required for stirring. These shares, which are made of any required width, hoe from 2 to 4 inches below the surface, according to the soil; on the shares being removed, the tines stir from 5 to 6 inches deep, a lad being enabled to hoe 2 acres of Turnips, &c., daily, cutting off every weed, and setting out the plants, reducing the price of labour from 4*s.* to 8*d.* an acre, or being able to hoe the crop six times, and much more effectually, for the same money now paid for hand-hoeing. Messrs. DUFAUR and Co. will exhibit, at the Royal Agricultural Show at Exeter, the following implements invented by Dr. NEWINGTON: A Drop Drill for horse power; the same for hand power; an implement to supersede broadcasting seed by hand for horse power; the same by hand power; an implement for broadcasting artificial manures or depositing it in rows by horse power; the same by hand power; a horse Dibble; a hand wheel Dibble; a subsoil Plough; a Scarifier or Cultivator; a paring Plough; a single horse Plough; hand drill Hoe and Cultivators, with various other fittings; a strike Plough.—Apply to Messrs. DUFAUR and Co., 21, Red Lion-square, London, who are the sole manufacturers and vendors of Dr. NEWINGTON'S inventions.

ASHBY'S INDIA EXPORT PALE ALE.—London Stores, under the South-Western Railway Terminus, Waterloo-road. India Pale Ale, 21*s.*, 18 gallons; 10*s.* 6*d.*, 9 gallons; Family Ale, 16*s.*, 18 gallons.—CHAS. ASHBY and Co. invite the particular attention of private Families and Clubs to their PALE ALE, as brewed by them for the COLONIAL MARKETS for the past 20 years. Supplied in small casks direct from the Brewery, Staines, and the London Stores, or from their agents—Messrs. W. Hancock, 80, Connaught-terrace, Hyde-park; Chidell and Stewart, 40, Lime-street, City; W. H. Chaplin, 11, Sebbon's-buildings, Upper-street, Islington; J. Shenton, Greenwich; W. Ferguson, Reading; Thos. Berry, Brighton and Lewes; A. J. Richardson and Co., Portsea and Southsea; J. Skidmore, Rickmansworth; Cooksey, Brothers, Southampton.

MARQUEES, SUN-BLINDS, RICK-CLOTHS, &c.—Manufactory, Old Kent-road, facing the Bricklayer's Arms Railway Terminus, and 17, Smithfield-bars, London.

"The guests are arriving; my villa has got
Quite a park-like appearance—a beautiful spot;
The band on the lawn, in the spacious marquee,
This tent for our dinner, and that for our tea."

Marquees and temporary rooms superbly fitted up for fetes, &c., on most moderate terms, by THOMAS EDGINGTON and Co.—Tents of every description, Rick-cloths, with poles, &c. Tanned Netting, for the protection of fruit-trees from frost, blight, and birds, and for the security of fresh sown seed either in gardens or fields, at unprecedentedly low prices, viz., 1*d.* per square yard, or 200 yards for 14*s.*, or 500 yards for 30*s.*, or 1000 yards for 50*s.* Sold to gardeners and shopkeepers by the cwt.—New Archangel Mats and Scrim Canvas for wall fruit; Tarpaulings for houses under repair, on hire. Orders and inquiries per post immediately attended to.

AGRICULTURAL EDUCATION.—THE COLLEGE, MAIDSTONE.

Visitor—His Grace the Archbishop of Canterbury.
President—The Earl of Romney.
Head Master—DAVID WALKER, Esq., M.A., F.G.S., &c.

At this Institution youths are instructed in the general branches of science bearing on Agriculture, in addition to the routine of a commercial and mathematical education.

The religious education is superintended by a resident Clergyman. Terms inclusive, 34*l.* a year.

NEW AGRICULTURAL IMPLEMENT.

BROWN'S PATENT FUMIGATOR, manufactured on a scale applicable for agricultural purposes, such as injecting a strong volume of smoke upon growing Turnips and other drilled crops, and thus obstructing the ravages of the fly. Also for fumigating Hops, Wall or Standard Fruit Trees, and driving vermin from their haunts. Price Eight Guineas.

Manufactured and supplied to the Trade by Messrs. COTTAM and HALLAM, 76, Oxford-street, London, where the Engine may be seen in operation.

SCHOOL FOR GENERAL AND SCIENTIFIC EDUCATION (especially with regard to Agriculture), Wickham Market, Suffolk, under the immediate patronage of the Right Hon. Lord Rendlesham, M P., Conducted by Mr. G. Downes. The Classical and Mathematical branches are entrusted to a Graduate of Cambridge, the Commercial and other departments to efficient Assistant Masters. A Laboratory, collection of Philosophical Apparatus, Library, &c., are attached to the School. Terms are moderate and inclusive, and may be known upon application to Mr. G. DOWNES, Wickham Market, Suffolk.

A vacancy for an articled Pupil.

IRON AND WIRE FENCING, AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE PARK), And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of PLAIN AND ORNAMENTAL IRON AND WIRE FENCING, Park Entrance, Carriage and Field Gates, Wickets, &c.; Deer, Sheep, and other Hurdles; Hare and Rabbit-proof Wire Fencing; Iron Bedstead Makers to the Board of Ordnance; And Government Contractors.

The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility, and on the most moderate terms. Drawings made and estimates prepared, if required. The show-rooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

THE SUMMER RIDE OR PROMENADE.—The peculiar virtues of C. and A. OLDRIDGE'S BALM OF COLUMBIA completely remove the difficulty experienced by Ladies in preserving their ringlets after exercise; its use so invigorates the hair, that tresses, previously the straightest and most destitute of curl, rapidly acquire a vigour which maintains in permanent ringlets the head-dress of the most persevering votary of the ball-room, the ride, or the promenade. After the Minerals and Vegetables of the Old World have been compounded in all imaginable ways in fruitless attempts to discover so important a desideratum, we are indebted to the Western Hemisphere for furnishing the basis of OLDRIDGE'S BALM OF COLUMBIA, the efficacy of which in preserving, strengthening, and renewing the hair has become a matter of notoriety among all civilised nations. Its restorative virtues are indeed a proverb, and the most satisfactory attestations to its infallibility in reproducing hair upon persons otherwise hopelessly bald, have been published from time to time by the Proprietors, 13, Wellington-street North, Strand, a few doors above the Lyceum Theatre on the opposite side.

3*s.* 6*d.*, 6*s.*, and 11*s.* per Bottle; no other prices are genuine. When you ask for "Oldridge's Balm," never let the shopkeepers persuade you to buy any other article as a substitute.

MRS. LOUDON begs to give Notice that she ceased to Edit the Weekly Journal entitled THE LADIES' COMPANION AT HOME AND ABROAD, with No. 27, completing the first volume, and that she has no longer the slightest connection with that Paper.—Bayswater, June 29.

MECHI'S DESKS, WORK-BOXES, AND TEA-CHESTS, 4, Leadenhall-street, London, combine all that is superb and cheap, with the most approved patterns, invented by himself, manufactured on his own premises, where may be seen some of the richest specimens in the world of Papier Maché Goods, Dressing-cases, Bagatelle-tables, Ivory Chess-men and Chess-boards, rich Card-cases, Tablets, and in fact everything for the work-table and dressing-toilet, displayed in a style of elegance not surpassed by any in this kingdom. MECHI is the sole and original inventor of the Castellated Tooth-brushes, Magic Strop and Paste, the Peculiar Steel Razor, the Cushioned Bagatelle-tables, and various improvements in Portable Desks and Dressing-cases combined.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

THE TEETH.—How often do we find the human face divine disfigured by neglecting the chiefest of its ornaments, and the breath made disagreeable to companions by non-attention to the Teeth! Though perfect in their structure and composition, to keep them in a pure and healthy state requires some little trouble; and if those who are blessed with well-formed Teeth knew how soon decay steals into the mouth, making unsightly what otherwise are delightful to admire, and designated unhealthiness by the impurity of the breath, they would spare no expense to chase away these fatal blemishes. But although most ladies are careful, and even particular in these delicate matters, yet few are sufficiently aware of the imperative necessity of avoiding all noxious or mineral substances of an acrid nature, and of which the greater part of the cheap Tooth Powders of the present day are composed. It is highly satisfactory to point out Messrs. Rowlands' Odonto, or Pearl Dentrifice, as a preparation free from all injurious elements, and eminently calculated to embellish and preserve the dental structure, to impart a grateful fragrance to the breath, and to embellish and perpetuate the graces of the mouth.—*Ladies' Gazette of Fashion.*

ROWLAND'S ODONTO

Is a white powder compounded of the choicest and most *recherché* ingredients of the oriental herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in rendering the breath sweet and pure. Price 2*s.* 9*d.* per box.—Sold by A. ROWLAND and SONS, 20, Hatton-garden, London, and by Chemists and Perfumers.

OLD FEATHER BEDS RE-DRESSED, AND PURIFIED BY STEAM WITH PATENT MACHINERY.—This new process of dressing not only removes all impurities, but by expanding the feathers the bulk is greatly increased, and consequently the bed rendered much fuller and softer.—Charge for dressing, 3*d.* per lb. Old and Mothy Mattresses effectually cured and removed, fetched and returned, carriage free, within five miles.—HEAL and SON'S List of Bedding, containing full particulars of weights, sizes, and prices, sent free by post on application to their factory, 196 (opposite the chapel), Tottenham-court-road, London.

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1*s.* Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free, by return for post, by J. WILLIS, 24, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for 13 penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to Copy BRANDE'S ENAMEL Advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

TO BE LET, on advantageous terms, an established NURSERY, in a northern county, within a mile of the Great North-Western Railway, containing about five acres. It is well stocked with young and thriving stuff, which will be turned over at a reasonable valuation. The present proprietor retires in consequence of a pressure of business of a very different character. An active person will find this a good chance for the investment of a moderate capital. It may be had with or without Three Cottages and a Barn. A small Greenhouse will be available, if necessary, also.

Apply to Mr. S. WILLIAMSON, Wine Merchant, Over, Cheshire.

TO NURSERYMEN, GARDENERS, &c.

TO BE LET OR SOLD, the Lease of the well-known and long established PARADISE NURSERY, Hornsey-road, Islington. The whole or part of the Glass and Stock may be taken at a valuation.—Further particulars may be had by applying to Messrs. PROTHEROE and MORRIS, Leyton-stone, Essex; or to Mr. WM. PAMPLIN, jun., on the premises.

PENTONVILLE.—A COTTAGE-BUILT HOUSE, near the Chapel, TO BE LET, No. 4, Collier-street, in substantial and ornamental repair, containing five bed-rooms, two parlours, and drawing room 22 feet by 16; replete with family conveniences, with good garden, well stocked, and summer-house.

May be viewed, and particulars had of Mr. JOHN SMITH, 8, St. John-street, Clerkenwell, London.

TO BE DISPOSED OF, the Wholesale Department of an Old and Highly-respectable London Seed Establishment; any one wishing to embark in the trade, or to add to their own business, will find this an opportunity rarely to be met with.—Apply to Messrs. STUBMY and SIMPSON, 8, Wellington-street, London-bridge.

MAYLE'S MODEL FUCHSIAS FOR 1850.—No grower can expect to win a prize at any of the principal exhibitions in town or country without these magnificent reflexed varieties.

Messrs. MAYLE and Co. will send out their SEVEN NEW FUCHSIAS on the 20th June, extra strong plants. From the very high opinions expressed of their merits by Dr. Lindley, Mr. Glenny, &c., they require no further comment from us. They are the things of the season, and must be had by all who wish to keep pace with the times.

No. 4, DIADEM, was shown at Walsall, near Birmingham, with two blooms, May 8th, and was awarded an extra prize. Judges' opinion: "By far the best ever raised."

Also first prize at Wolverhampton, May 25, against some fine older specimen varieties; and first-class certificate awarded at the Birmingham and Midland Society on the 20th.

Those in bloom were exhibited at Chiswick and Regent's-park June shows. The earliest orders will secure the strongest plants. Circulars can be had. Also Mr. Hoyles' superb Geraniums, a few extra strong blooming plants being left.

Stove, Greenhouse, Bedding Plants, &c., including every novelty of the season.—105, New-street, Birmingham.

BASS AND BROWN'S DESCRIPTIVE PRICED CATALOGUE sent prepaid for four penny stamps, for postage. This Catalogue contains a rich assortment of the newest and best plants which can be procured. The stock of BEDDING PLANTS is unusually strong and fine. Several thousand plants of Verbenas are now ready for sending out, as well as our collection of other plants for bedding, the stock of which is also very extensive, consisting of Geraniums, Fuchsias, Petunias, Dahlias, Chrysanthemums, Anagallis, Bouvardias, Cupheas, Heliotropes, Plumbagos, Lantanas, Salvias, Lobelia Erinus grandiflora and compacta alba, Zauschneria californica, &c.

Persons requiring Plants for beds may depend on receiving a supply, strong, and in fine condition, at low prices.

Seed and Horticultural Establishment, Sudbury, Suffolk.

PLANTS OF CABBAGE, SAVOY, KALE, BROCCOLI, CAULIFLOWER, AND CELERY.

JOHN CATTELL, SEEDSMAN and NURSERYMAN, Westerham, Kent, begs respectfully to inform the public that Plants of his superior true sorts of the above are now ready, and will be forwarded, as usual, to order, on receipt of postage stamps or Post-office orders, at the undernamed prices, basket or mat and package included:

All the sorts of early Cabbage, Savoy, and Kale, including Brussels Sprouts, 4*s.* 6*d.* per 1000; all the sorts of Autumn and Spring Broccoli and Red and White Celery, 6*s.* per 1000; Cauliflower, early and late, and Red Cabbage, 9*d.* per 100; Drumhead or Cattle Cabbage, 3*s.* 6*d.* p. 1000.—6*d.* per 1000 less when no mat or package is required. Packages of 1000 and upwards delivered free of carriage to the Edenbridge Station of the South-Eastern Railway.

Seeds of CATTELL'S superior "Dwarf Barnes," and his "Dwarf Reliance" Cabbage, may be had in packets, by post, for 12 penny stamps per packet, the former containing 1 oz., as usual, and the latter ½ oz.

EDWARD BECK, SLATE WORKS, ISLEWORTH. SLATE CISTERNS, &c.; COLE'S PATENT.

E. BECK informs Horticulturists and the Public generally that Mr. COLE has granted him the use of his Patent for the unexpired term, and he is now able to supply SLATE CISTERNS fastened without iron bolts or the usual oil cement, thereby doing away with the difficulty which has hitherto existed of forwarding such articles by rail or waggon, fixed and ready for use instead of in pieces, as heretofore.

E. B. will be happy to answer any inquiries as to the price of Cisterns, or any other Slate articles manufactured by him, such as Orange Tubs, Plant Boxes, Tanks, Shelves, Garden-path Edging, Hot-water Tank Covers, Flower Boxes for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c., all of which may be seen in use at Worton Cottage, Isleworth, on application to the Gardener, Sundays excepted.

Estimates given for Work as shown upon Drawings, and in specifications. A large stock of Slate Slabs of all sizes and thicknesses, kept on sale.

N.B.—Dairies fitted either with Shelves or Milk Pans, of very neat appearance.

LUCOMBE, PINCE, AND CO. beg to call public attention to their Advertisement in the last week's Numbers of the *Gardeners' Chronicle* and "Journal," of PENTSTEMON CYANANTHUS, and to Sir W. Hooker's description and drawing in the "Botanical Magazine" for September, 1849. Fine healthy plants will be ready on the 15th July.

Exeter Nursery, June 29.

The Gardeners' Chronicle.

SATURDAY, JUNE 29, 1850.

MEETINGS FOR THE ENSUING WEEK.

MONDAY,	July	1—Entomological	8 P.M.
TUESDAY,	—	2—Horticultural	3 P.M.
WEDNESDAY,	—	3—Royal Botanic Gardens	2 P.M.
THURSDAY,	—	4—Zoological	3 P.M.

COUNTRY SHOWS.—Monday, July 1: Slough Pink.—Tuesday, July 2: Hampshire Horticultural, and Halstead Floral and Horticultural.—Wednesday, July 3: York Horticultural.—Thursday, July 4: Diss Horticultural.

WE are informed that the rare and valuable collection of hot and greenhouse plants, the property of his late Majesty WILLIAM II., King of the Netherlands, will be publicly sold by auction in the month of August next. The catalogue of this superb collection is now preparing, and will be published shortly: on its appearance, we shall return to this interesting subject.

MESSRS. GARRAWAY and Co., of Bristol, and Mr. WHEELER, of Gloucester, have achieved an unenviable success. They have managed to fasten upon the GARDENERS' BENEVOLENT INSTITUTION an annuitant, who has not paid one farthing to the funds of the charity, at the expense of others who have subscribed to it for years. EDWARD BEACH, *who has never subscribed one farthing*, is, after five struggles, elected as a pensioner, while JAMES GREEN, *who has subscribed for* 12 *years*, IS PASSED OVER.

If this is not a discreditable job, we do not know what a job is. Had the intention been to ruin the charity, a more certain course could not have been taken; for it is clear that nothing is gained by subscribing to its funds; on the contrary, to subscribe is to be declared ineligible. Why should a gardener now continue to subscribe when he sees that those are best off who give nothing? The guineas that he pays the institution produce no advantage to himself; he is more likely to be elected if he keeps his pockets buttoned up.

A comparison of the number of votes that each candidate obtained on the last occasion with the amount of his previous subscriptions to the institution, is highly instructive. The returns officially published give the following result:

No. of years' Subscription.	No. of Votes.	Name.
12	77	GREEN.
7	187	BATTEY.
5	289	COCKS.
5	480 (elected)	SHEPHERD.
4	137	RUDLAND.
4	68	ROBINSON.
4	147	SNOW.
0	171	MARSHALL.
0	101	APPLEBY.
0	358 (elected)	BEACH.
0	8	BROWN.
0	22	EVANS.
0	11	HURDEN.
0	138	FITZGERALD.
0	20	HOPKINS.
0	98	SCHNEIDER.
0	4	CARTER.
0	—	SKEATES.

So that it appears that BEACH, who had never subscribed one farthing, polled almost five times as many votes as GREEN who had subscribed 12 years, or as ROBINSON who had subscribed four years. It also shows that FITZGERALD, an applicant brought forward by Messrs. LEE, of Hammersmith, having paid nothing, was better placed upon the poll than BATTEY who had given his hard earnings for seven long years.

It is evident that this method of managing matters, although it may afford a wretched triumph to a few nurserymen, must end in the ruin of the charity, unless it is immediately put an end to. It completely justifies the assertion, which we have often heard made, that the Gardeners' Benevolent Institution would become a mere nurserymen's convenience.

We therefore call upon the committee to come forward at once with some declaration, and as quickly as possible with some bye-law, the effect of which shall be in the first place to limit the candidates to those who have been subscribers to the charity, and secondly to secure the pension to those who have subscribed longest; so that no contest shall be possible except among those who shall have subscribed the same number of years. Thus suppose there were two vacancies and five candidates, of whom A has subscribed 7 guineas, C and D 5 each, B and E 4 each; then A would be elected without poll, C and D would go to the poll for the second vacancy, and B and E would be excluded for that time.

That such a course would produce a great accession to the income of the charity is highly probable; but whether it would or would not, is of much less consequence than putting an end to jobbing, and rendering it impossible to prefer strangers to the true and steady friends of the institution.

THE following fact seems to deserve the attention of our readers: *Rain at Chiswick*—1850.

	Inches.
JANUARY	1.43
FEBRUARY... ...	0.95
MARCH	0.13
APRIL	1.79
MAY	1.84
1st to 24th of JUNE	0.39
	6.53

Average amount for the whole year—about 24 inches.

Hence it appears that about 6½ inches have fallen in the first half of the present year, leaving the complement of 17½ inches for the next six months.

A FORTNIGHT since we drew attention to some sound practical observations by Messrs. STANDISH, of Bagshot, upon the cultivation of AMERICAN PLANTS. That the instruction thus conveyed was the result of experience was sufficiently proved by the operations which it described. That the practice is also strictly conformable to theory we shall now endeavour to show.

The three points which a gardener must attend to, if he wishes to grow American plants well, are the following:—1, the soil must be loose and rich; 2, there must be free and constant access of moisture without stagnation; and 3, there must be no chalk. In these three rules the whole art and mystery consists; and all the tedious directions which books contain on the subject are either superfluous or are included in them.

The soil must be light and rich. Peat is not insisted upon; on the contrary, it is expressly stated that other substances will answer the same purpose, provided they are in the same mechanical condition. The reason of this is obvious. "American" plants have in all cases delicate hair-like roots, which remain for years without any considerable increase in diameter; such roots cannot force their way through a soil which offers much resistance to their progress. Therefore clays, stiff loams, and any other adhesive compact kinds of earth, are unsuitable to them. Excluding these we have nothing left except sand, very sandy loam, and decayed vegetable matter; and those substances intermingled form, in fact, the very soil that American plants demand. The idea of peat being essential is a mistake; it is a very good material, because it consists of sand and decayed vegetable matter; and so will any other mixture of the kind be also a good material. Decayed leaves, fragments of rotten branches, dead roots, (probably charcoal), and such matters mixed with sand, in order to prevent the soil from becoming too compact, replace it perfectly. The only value of peat consists in its being a good natural mixture of what is wanted, and readily procurable in large quantities, in many districts. As to the addition of loam, the necessity of that depends, we imagine, upon little except its power of retaining moisture longer than dead or decayed vegetable matter. Provided the requisite moisture can be constantly secured, loam ceases to have value. As to manure, no mistake can be greater than to suppose that, because plants happen to grow in poor barren soil, they prefer it. With the single exception of Conifers, we believe that all known plants are improved by manure skilfully applied, provided it is not in too recent a state. Phosphates, sulphates, and azotised matter in small quantities are the all but universal food of plants, and "Americans" like them as well as their neighbours. If any one doubts it he has only to drench them now and then with weak liquid manure; that made from Peruvian guano, or cow-dung, is the most active, apparently in consequence of its abounding so much in phosphates.

There must be free and constant access of moisture, without stagnation. In this respect "Americans" offer no exception to the general rule; the roots of all plants, if to be kept in high health, must have free and constant access to moisture, and without stagnation. That is the law. What then is peculiar in American plants is merely this, that their roots are much more quickly dried up than the roots of other plants. They are not thick, fleshy, cellular masses, coated with a spongy bark capable of detaining moisture with great force. On the contrary, they are, as has been already stated, and as we all know, delicate hair-like fibres, whose bark is little more protection to them than the skin of a leaf. Such being their structure, they are emptied of whatever fluids they may contain the moment that the earth in contact with them becomes dry; and once emptied they necessarily perish. All those directions, therefore, which insist upon keeping the level of American beds completely below the surrounding surface, when the situation is not naturally damp, are founded upon a correct appreciation of the nature of these plants.

Why chalk should be offensive to them we are unable to explain. Such is certainly the fact; and we apprehend that one of the reasons why the American plants at Knap Hill and Bagshot are so much finer than any in the valley of the Thames, is essentially owing to the great abundance of lime in the water of all the latter district. It appears from analysis that while London water, that is to say Thames water, contains 16 grains of lime in a gallon, Bagshot water contains only one grain, or less.

The true difficulty, then, in growing American plants, is not, as is generally alleged, the want of proper soil, for that may be made anywhere, but the want of a sufficient supply of pure water; and it may be a question whether a very material difference would not be found in those places where American plants grow badly if rain-water alone were used in watering them, instead of that from pumps and ditches.

IN another column will be found what letters we have received upon the subject of the NAMES OF PLANTS. That signed "*Nomenclator*" ably expresses the views of those who are opposed to absolute change in scientific nomenclature when introduced into familiar language. As it is probable that others will also reach us, and as we are anxious that both sides of the question should be fully and fairly argued, we defer such remarks as we may ourselves have to offer until somewhat more time shall have been given for our correspondents to express their opinions. That they *will* express their opinions we earnestly hope; for this is no light matter; and unless we are much mistaken, the present is one of the most favourable opportunities that can be taken for collecting the views of intelligent persons. Many readers of our columns will no doubt shrink from expressing publicly any opinion whatever. In such cases we would

earnestly solicit them to favour us *privately* with their sentiments, so that we may collect the votes on both sides for our own guidance; and we promise to report the result faithfully for the general benefit.

The best way, perhaps, of expressing an opinion, without offering an argument, will be to say merely, "I agree with the Editor," or "I differ from the Editor," as the case may be.

EXPERIENCE TEACHES FOOLS.

I TOOK your advice—bought "A Packet of Seeds saved by an Old Gardener," which I have sown in a patch of poor shallow ground, for fear they should all run to leaves. I wish to save some of the sorts for next year, especially the species said to require a hot-bed in winter. To get my hand into practice, I am picking up seeds of wild flowers, not for their beauty but their worth. Should you think them of any use for your Horticultural Garden, I don't mind sending you a few occasionally, while they are fresh.

No. 1. "EXPERIENCE TEACHES FOOLS." — I have just been seeing my neighbour, who, instead of shaking hands with me in the usual way when we met, looked at me as if I had been a thief. "What's the matter with you now, Sam?" said I. "What's the matter! you d——l, you have made me kill my best specimen plant. When I came over the other day to see you, I admired the looks of your plants, they were so bushy, and even the two or three Heaths you have are growing away like Grass in a meadow. I thought myself very fortunate to catch you in the act of potting one of them, and took it for granted that your system must be right. When I came home I went to work, drained my pot, prepared my soil, and potted my plant exactly in the same way as you did, only I was afraid of my plant damping off at the neck, and placed the old ball a little higher than you did. Confound the plant, there it is, and I am afraid two or three more will soon follow it." "Well, my good friend, if you do as I do, your plants will grow as mine grow; but let us turn this once fine plant out of its pot, and I think I will be able to show you where the rogue lies." Out it came, the old ball was hard as a brick-bat, and as dry as dust. "Now are you satisfied that the fault is yours?" "Well, but you see the new soil is wet enough, and although dry in the centre, how comes the plant to go off at the neck first?" "Had the soil been kept wet enough in the centre, there would have been no fear of damping off at the neck. You have kept on watering, and your old ball being elevated, all the water is thrown from the centre into the new soil, in which there are no roots to absorb it; stagnation has taken place, which, together with a dry centre, has destroyed the vitality of the whole root, and that part nearest the surface of course shows the first symptome of decay." "Well, then, if that be the case, I do think it too bad of those big people about London to lead such as me astray. I have a scrap of an old paper on the cultivation of Heaths, written by a Mr. Leach (and he is said to be one of the best Heath growers in England); speaking of repotting, he says, 'Place the collar of the plant a little above the fresh soil, in order that no water may lodge round that part. Now, this is in print, which I will show you."—"Well, I have seen some of Mr. Leach's Heaths, and certainly they looked very well; but if you believe all you see in newspapers, and depend upon it more than you do on your own eye-sight and common-sense, why I will say you are a simpleton. Think for yourself, and try for yourself; the field of art and science is as free to you as to any other. I have seen the cream of all the collections of plants about London, more than once gathered together, from which I have learned more than ever I did from scraps of old newspapers. I have had plants die under my care, as well as you, and exactly from the same cause as that one of yours; but I never had a death without making a *post mortem* examination, with a view to ascertain the cause, and I can frankly tell you that, in almost every case, it proved to be drought at the centre; nor are we the only growers who have lost plants in this way. I have seen the same happen with others, even some of the best cultivators for Chiswick exhibitions. Yes; and I have been one of the jury on several inquests, too, when in every case the verdict passed was, 'Died in consequence of the heart having become too hard to admit moisture.' It is a general practice with those who grow plants on pages to have the 'crown' or 'collar' elevated; even the late Mr. N'Nab, of Edinburgh, the father of specimen Heath growing, sanctioned this system; doubtless led away, like many others, with the idea that water might 'lodge round that part,' so as to cause death. All stuff. I wonder how long a plant would live, if the soil about its roots were made or allowed to become so hard that water could not filter through it? What then is to become of it when repotted, if the 'collar' is raised up to prevent the water from getting into it? Why the first shift to the rubbish heap. This system being so often seen both in practice and print few people suspect the evil, and even some must have their plants potted in this way; I have myself been obliged by my employer to do so, although I knew all the while what I was doing, but not a word could be said; it was in print, and therefore must be right.

"Now, Sam, before we part, I will tell you how I do, then you can please yourself about believing it. I use rough soil, of course varying it according to the subjects I have to deal with; but recollect when I repot a specimen, such as yours was (now in pieces before us), I place the old ball as low as I intend the soil to be, then I keep the new earth up as high as the brim of the pot, all round, thus, as it were, forming a basin round the 'collar' of the plant; but do not suppose that I allow this bankment always to remain; no, only for a few weeks, or such time as I think the roots have penetrated through their new bed, then I take it away, leaving the surface as even as I possibly can. Since I have adopted this plan, I have not lost a single plant." We parted good friends. *An Old Showman, June 14.*

DISEASES OF PLANTS.

(*Continued from p.* 389.)

GENUS II.; *one species.* SMUT. — This disease has many names, and is often confounded with Bunt. It is called amongst us by the names of *fuliggine, filiggine, carbone, carboncino, ustilagine, nero, abbruciamente, arsura* (coal, burn, black), and by some of our cultivators by that of *marciume* (rottenness). Cerealia are much afflicted by it, but not exclusively, for besides infecting, I may say, all Gramineæ, it will also attack other plants. It appears to me, however, as far as my observation goes, that it is confined to monocotyledonous plants, as I have only met with it on Liliaceæ.

In our fields it affects more especially Wheat. I have not as yet verified the assertion of Tessier that it commits great ravages on Millet, Barley, Oats, and Maize. Possibly it may have been confounded with the fungus of the Maize which I have referred to in my second class. The ears of Wheat attacked by the smut appear, when first shooting out, to be blackish and decaying. When freed from their sheaths, they soon dry up and resolve into a minute impalpable and fœtid dust, which is carried off by the wind or any slight shock, leaving the extremity of the stalk truncated and bare, but always entire, green, and well formed. This disease is very ancient, and was observed by Ambrosini in the Bolognese fields, and has been very improperly confounded with the bunt, which, as we shall see, is a very different thing. Ambrosini calls it *ustilogine*, or *burn*, because the plant looks as if the top were burnt off. Very rarely the ear before resolving into powder preserves for a short time something of its natural shape, supported by the sheath of the uppermost leaf, but it always ends by decomposing into dust. Very often the disease may be known by the colour of the plant, the leaves before the development of the ear turning yellow, and withering at the extremity. Amongst us, if corn is attacked by smut alone, it does not do much mischief; but it is usually accompanied by the bunt, and the latter causes great havoc often attributed to the former. It is true, indeed, that smutted plants make fewer stems than healthy ones, and I have myself never seen a single sound ear on a plant once affected.

I have scarcely seen the disease on Barley, but it may have escaped me for want of a sufficiently careful search, for the ear is not so entirely destroyed by it in Barley as in Wheat. I once saw it, however, in my garden on some plants of *Hordeum hexastichum*. The appearance agreed exactly with those observed by Tessier. I have never found the smut on Maize, but from what I have read I think what has been so called is very near to the fungus of the Maize.

Besides Oats, I have observed the smut on various species of Bromus and Briza, on the Melica ciliata, on some Agrostides, and generally on almost all kinds of Grass which have fallen under my eyes, but especially those of water meadows. Some smaller kinds of Squills, and of yellow Ornithogala, have exhibited all their organs of fructification converted into a black powder, the stalk alone remaining, but I have never found either this or the next disease upon any dicotyledonous plants. Tessier asserts that he has seen Oat plants one-half sound and the other destroyed.

This disease has been variously attributed to manures of bad quality, to bad cultivation, to the thickness of fogs, to the humidity of the soil, to the work of insects, and to a defect in fecundation; but in fact the true cause has not yet been discovered. It has only been ascertained that the deeper the seeds are sown the more general it is. It remains also undecided whether this disease be contagious or not, owing to the difficulty of making experiments, from the rapidity with which the brown-green dust is dispersed. Tessier says that sowing grain gathered from a field attacked by smut will reproduce the disease; and there is no doubt that it may be prevented by steeping the seed corn in the same manner as for the bunt. For this and the two following diseases, Ginanni's treatise is well worth reading, in which it is clearly shown that the smut is produced before the ear is yet visible. No one has written more in d tail upon it than Tessier, who says that the smut of Oats is not contagious for Rye.

BEST TWELVE CARNATIONS AND BEST TWELVE PICOTEES.

Compiled by J. EDWARDS, Esq., F.H.S., Wace Cottage, Holloway,

From returns obtained from the following gentlemen, viz.: Messrs. Bragg and Turner, Slough; Barringer, Bedford; Creed, London; Ellis, Newhall, Norman, and Ward, Woolwich; Dodwell, Derby; Hallam and Pope, Birmingham; Holliday, Northampton; Hollyoake and Marris, Leicester; Hudson, Kingston, Notts; Keynes, Salisbury; May, Sonning, Berks; Pemble, Chatham; Sealey, Bristol; Slater, Manchester; Terry, Rochester; Wood, Nottingham; and Matthews, Weston-on-the-Green.

VILLA AND SUBURBAN GARDENING.

Few plants contribute more to decorate the greenhouse of the village gardener than the different varieties of Achimenes. On this account they deserve more than a passing notice, for they are very easily cultivated, and occupy little space in winter. All who possess a cold pit or greenhouse may grow them well; but of course those who have warm pits or hothouses may enjoy their beauties for a longer period of time. A few years ago we had little in this genus to attract our notice except the old coccinea, and its culture was much neglected; like many other plants it only existed as a botanical curiosity, gardening skill had not then been brought to bear upon it, and we never saw such specimens of it as we have seen of late years.

It is now well known that the Achimenes are all easily propagated, that almost every scale of the tubers forms a plant, and that these may be made to bloom during the current season. The amateur who may possess tubers, and whose object is to secure strong blooming plants rather than numbers, will do well to retain the tubers entire. Before they are divided, and when first brought from their winter quarters, let them be plunged in a pan of water until the soil is completely wet through, in every part, then place the pots on a warm shelf to drain. In this position they may remain until they begin to show symptoms of growth, when they may be turned out of the pots, and the tubers collected from the soil. If single specimens are desired, then place the tubers singly in 3-inch pots, and when they are 3 or 4 inches high repot them into 8-inch pots. By good treatment they will throw up numerous shoots from the base of the first shoot, and these will throw out laterals, and will ultimately render the plant an object of much interest. Another mode of culture is to place eight or nine tubers in a seed pan 12 inches in diameter. These eventually make magnificent specimens wherewith to adorn either conservatories, greenhouses, or drawing-rooms.

The soil which I would recommend for the Achimenes, and in which they will bloom beautifully, is equal parts turfy peat, fibrous loam, and leaf mould, and one-fifth silver sand.

In their culture be very particular that the pots or pans are perfectly drained; as they begin to grow in spring, let the supply of water be limited, but as they advance in growth a more plentiful and more frequent application will be required; and when in full vigour of growth, liquid manure may be administered with much advantage. This will also tend, in a great measure, to prolong their flowering season. When decay in the flowers and foliage begins to be apparent, carefully, but progressively, withdraw all waterings, place the plants in the full sun under cover, until their stems are withered, when they may be stowed away under a greenhouse stage in any dry place, laying the pots on their sides, in order to prevent the ingress of moisture. *Pharo.*

Scientific Nomenclature. — I am happy to find that the writer of the Leading Article in your last Number seems inclined to modify his views with respect to the substitution of an English nomenclature for the binomial system, adopted by all cultivators in every department of science since the days of Linnæus. This is no trivial question, and one that ought not to be submitted to the caprice of any individual, however great his name or exalted his station in the ranks of science. It is a world-wide question, and should not be disturbed without the sanction of a general congress of science. There are three modes by means of which, either singly or collectively, the advocates for the alteration seek to carry out their views: 1st, By the literal translation of the technical terms; 2d, by Anglicising their terminations; and, 3d, by the use of vernacular names. To the first mode an objection rises *in limine*, almost insuperable, in the inapplicability of the English language to convey the meaning of the classical names without the use of phrases inconvenient for their length and inelegant in their construction. How, for instance, can we translate Epidendrum selligerum and Phalænopsis amabilis otherwise than the Saddle-bearing Tree-dweller and Loveable Moth-face? and when we have accomplished our task to the entire satisfaction of the village schoolmaster (that stalking-horse and pretext, in these days, for the dissemination of so much trash, falsely styled useful knowledge), what can be more ridiculous than the result of our labours? and what more intelligible idea do we convey to the general reader than by the use of the more euphonious and more easily remembered appellations derived from the dead languages? Generic and specific names, when properly constructed and judiciously applied, ought and do convey to the scientific reader certain definite peculiarities appertaining to the thing named; but in order to the just appreciation of the information so imparted, a certain amount of previous knowledge of the subject is indispensable; and to any one not possessing that knowledge, such a name as Bean-like Cutridge would convey no more information than Acrotemnus Faba, and consequently the only important argument adduced in favour of the innovation, namely, the desire to disseminate scientific knowledge amongst the lower classes, falls to the ground. In point of fact, to the generality of readers, the names given by men of science to certain objects constitute a sort of *memoria technica*, by means of which they are enabled to commit to memory, without effort, a considerable number of the objects so named; and, for this purpose, a technology compounded from the dead languages is far more appropriate than any combination of English words, as we have proof in the fact, that the best system of artificial memory ever constructed was upon the principle of Latinising the words, and arranging them in hexameter verse. There are various other objections to the plan, as, for instance, the inconvenience attending the transposition of the generic and specific names, and the ambiguity produced by using translated terms of species, well known by their technical appellations. I am at a loss to know what plant is alluded to in the *Chronicle*, of June 15, as "Beauty Dendrobe," whether Dendrobium formosum, speciosum, or pulchellum? To the other two modes of providing English names there is less objection; indeed, they may frequently be adopted (in addition to the classical names) with advantage, when not applied to species. The plan of Anglicising the terminations of the technical terms, when using them in English composition, often renders the construction of the sentences more concise, and the phraseology more elegant; it also facilitates the use of the plurals, without the seeming pedantry of declining the Latin or Greek words. Oncid, Dendrobe, and Orchids are decidedly preferable to Oncidium, Dendrobium, and Orchidaceæ. With respect to vernacular appellations, when you have them known and recognised, by all means use them in preference either to Anglicised or translated names. Let us have Snowdrop, not Milkflower; Oak and Beech, not Querque and Fage. Let the Frenchman enjoy his Chêne, and the German his Eiche; but let us not, nevertheless, lose sight of the cosmopolitan designation Quercus, which conveys now, as it has done since the days of Virgil, the same idea to the mind of the whole world. *Nomenclator.*

Out-door Vines.—A friend of mine in Gloucester has an out-door Vine of the Dutch Sweetwater variety which yearly produces a vast show for fruit, but scarcely ever ripens any of it. Only here and there are there any stones in the Grapes; the main body are mere abortions. What is the cause of all this? The soil is of extraordinary depth and richness, but at 3 or 4 feet you come to water. Would root-pruning be safe in such a case, so as to enable him, by undermining the tree, to deposit a quantity of brick-bats, old mortar rubbish, and other rough but dry materials, to cut off the communication with the moisture beneath? *Samuel Taylor, Barnwood, Gloucestershire.* [Instead of pruning the roots, raise them gradually, and bring them near the surface.]

Botanical Names.—While resting on my oars after some lengthened exertion as a contributor to the *Gardeners' Chronicle*, I have been roused to a fresh attempt by the excellent leading article of last Saturday, on the important subject of botanical terminology. The practical wit exhibited in that paper, the union of the *utile cum dulci* (the useful with the sweet), seems to ensure to the writer the full realisation of his own views, provided he will continue to favour the public with such illustrations as he has thus furnished. I shall not, therefore, enter the lists as an advocate on the general merits of the question, but merely glance at a collateral topic, which yet has an important bearing on the main argument. I allude to the aid which is lent to mere empiricism and learned ignorance by an unnecessarily scientific phraseology. I know a working gardener at this time who keeps the visitors to his master's greenhouse in a continual titter by his mal-pronunciation of Latin and Greek names, which, if Anglicised, would be correctly uttered, and yet the honest man believes all the time that the *oses* and *uses* are as much a part of his art as digging, and potting, and grafting. If this were all, the evil would be scarcely worthy of notice; but it strikes its roots into general society. I meet with persons who, if botanical terms were expunged from the Queen's English, would stand on their own merits as ignoramuses; but who are enabled, by Greek and Latin, to throw dust in the eyes of their auditors and pass themselves off as profound botanists and learned men of the first water. Apart from the more professional advantages which will result from the reform you recommend, pedantry and quackery would, by it, be deprived of some of their plume: this is, I was about to say, a desideratum, but acting on my own precept, I prefer to call it, "a consummation, devoutly to be wished." *Henry Burgess.*

What Effect has Guano upon Pelargoniums?—My gardener has applied it, and I fancy that the wood is much stronger, but that the flowers are smaller. *H. E. W.* [The effect of any stimulating manure, in certain conditions of the plant, is to make growth in leaves and wood at the expense of the flowers. When the pots are quite full of roots, and the bloom coming up strongly, guano water, or similar liquid manure, may be given with advantage.]

Names.—If there was one portion of his labours for which the late Mr. Loudon deserved praise more than another, I think it was his ceaseless endeavour to make everybody pronounce the names of plants correctly. The very marked improvement in the catalogues of nurserymen is some proof that he did not labour in vain. Still, however, it is not unco mmon to hear Gladíolus made to rhyme with bolus, and Camellia (though

spelled with two l's) with Amelia. But bad as this is, it is, in my estimation, far less offensive than to read and hear of Oncids and Ceanothes. Only in your last Paper it was thought necessary, in one short sentence, to use both Ceanothe and Ceanothus. This is more puzzling to the nurseryman than adhering solely to the Latin name. Besides, where is this Anglicising scheme to stop? What right have we to appropriate tropical plants that abhor our climate? Not to go any further than hardy plants, what publication is popular and influential enough to induce people to talk of Campanules, Ranuncules, Rudbecks and Crokes? Asparagus must of course for the future be called Grass; but what shall we do with Eschscholtzia and Chætogastra? I am firmly persuaded that no man of acknowledged taste will acquiesce in this new scheme. "Gents," perhaps, may be grateful for your abbreviation. *O. P.*

Orchids, and the Establishment of a new Society relating to them.—I have for some time been satisfied that it would be very desirable to establish a small society for the propagation of the knowledge of Orchidaceous plants, recording novelties, and any peculiarities as to their culture, &c. The taste for these plants is spreading daily, and Mr. Bateman's sale, where the principal growers or their gardeners were collected, reminded me of the Roxburgh book club, founded after the great sale of the rare Roxburgh books. I think from 100 to 200 might be reckoned on; and, say that the subscriptions were 2 guineas per annum, and 1 guinea entrance, this would enable the society to defray the small expense of periodical meetings, and probably to publish a small journal. Perhaps the society might hire "for a consideration" the occasional use of the meeting room of the Horticultural Society, and the 1 guinea entrance would go towards defraying any small preliminary expenses. I think I know at least 25 persons who would join the society, and I throw out these few random hints to see how the subject is taken up by yourself and your readers. The society as proposed would not interfere with the great Chiswick and Regent's-park exhibitions, as I only propose that plants should be exhibited at the meetings of the members. The process of lithograph enables persons to publish figures of plants at a comparatively cheap rate, so that the journal would not I conceive be very expensive, and some small return may be expected from its sale to non-subscribers, especially on the Continent. *Dodman.* P.S. I protest against all Punch-like jokes suggesting that the new society should be called the Parasites, &c.

Rose Stocks: R. Manettii, v. R. canina, &c.—In looking over the remarks on this interesting subject, I do not observe any notice made of the great difference of habit that obtains in the Dog-rose. By a careful inspection of the stocks of this kind, it will be seen that the foliage differs considerably in size, colour, and form, and that the shoots differ also in their vigour and manner of growth. Some are like the Noisettes, some the Gallicas, some the albas, some the sempervirens, &c., and yet in budding but little regard is paid to these differences. Is it wonderful, then, if the buds take, that the plants should ultimately fail? In looking over a border of Teas this season, I found that several very vigorous growers had lost their buds. It seems that the delicate infant had been placed in charge of an elephant, and in the animal's endeavour to place it on its back the babe was strangled in its trunk. In budding indiscriminately on this stock, then, we know not what we are doing, or rather we are setting our knowledge at defiance and taking the risk. By careful attention we may classify these varieties, and ascertain their adaptation to the several scions; but is it wise to reject the results of experience so slowly acquired? Facts are stubborn things. The Dog-rose, as a family, differs in its vigour in the proportion of fully one to three. The Manettii, Celine, Boursault, &c., are uniform in their growth, and the habit of the scion has only to be studied to insure success, while the chopped uncouth roots of the Dog-rose almost unfit it for pot culture; its spawn gives incessant trouble, and its mutilation prepares it for decay. In my retentive soil the dwarfs succeed but indifferently, and are far inferior to the standards, so I cannot but hail the prospect of their giving place to their betters. In a light sandy loam, by a water-course, I have found cuttings of Celine root as freely as the Manettii. *J. J. Foster, Edgeware Nurseries.*

Exhibitions of Northern and Southern raised Carnations and Picotees.—It will be seen by your advertisement pages that schedules for these exhibitions are being distributed. The prizes appear to be of sufficient value to tempt growers from distant localities to exhibit, and they are numerous enough for the due encouragement of the many. The discussion with respect to showing "on or off cards" seems to be settled pretty amicably in a fair compromise, and subscriptions are liberally forwarded. Mr. J. F. Wood, Nottingham, has sent 2*l.*; Mr. Merryweather, 10*s.*; Mr. Buswell, 10*s.*; Mr. Holland, 1*l.*; Mr. Wallis, 5*s.*; Mr. Elliott, 2*s.* 6*d.*; Mr. Jackson, 5*s.*; Mr. Gibbons, 5*s.*; Leeds Committee, per Mr. J. Rhodes, 3*l.* 10*s.*; Superintendent of "Florist and Garden Miscellany," 5*l.*; Mr. C. Turner, 5*l.*; Mr. J. Keynes, 5*l.*; Derby and neighbourhood, 20*l.*; and many promises are yet to be performed. I understand that the subscription list closes on the 10th of July, after which date an entrance fee will be charged to intending exhibitors that may then be non-subscribers. These exhibitions have been instituted with the intention of testing northern with southern raised flowers, and no doubt the result will be highly interesting to florists. *J. Edwards.*

The Potato Disease.—Some of my Potatoes were planted in a hotbed, about 3 yards square, without any manure, and from that quantity of ground I have not had more than a pint fit for table; others have been more tainted this year than I have had them before. They were the early Ash-leaved Kidney, planted whole, and at the usual depth. *J. Taylor, Weddington, near Nuneaton, June* 23.

Garden Terraces.—In the rage for change, and the introduction of clumps, and shrubbery walks, and serpentine paths, the fine, broad, elevated garden terrace got out of favour. The good taste, however, of the present day is restoring this grand feature of the flower garden. Southey, like myself, had seen the magnificent terraced gardens of Lisbon and Cintra, and felt their beauty. To prove this, I send the following extract from one of his letters just published:—"I congratulate you on exchanging the pavement of Whitehall for your noble terraces, which I never can think of without pleasure, because they are beautiful in themselves, and carry one back to old times. Anything that does this is good. Were I to build a mansion with the means of Lord Lonsdale or Lord Grosvenor, I would certainly make hanging gardens, if the ground permitted it. They have a character of grandeur and of permanence, without which nothing can be truly grand, and they are fine even in decay." R. Southey to C. W. W. Wynn. *Dodman.* [Yes; but who is to do such things without the princely fortunes of these great nobles?]

Monstrous Plums.—The inclosed, which I suppose is a malformation of the fruit, I have taken from a

Plum tree, which is nearly covered over with such productions. *F. D., Newburgh-park, Easingwold, June* 17. [This is a disease which occasionally attacks some kinds of stone fruit. It consists in a fungous enlargement of the shell of the young fruit, which then grows up into a distended leathery bag. The cause is unknown. In a Bird Cherry, found in the Himalayas, a similar appearance is so common as to have given rise to the supposition that the plants in this condition are a peculiar species, and to the name Cerasus cornuta.]

Change of Note in the Cuckoo.—I imagine that the observers of natural history will agree that the change of note alluded to by "Este" is by no means uncommon. About the same period I noticed in my locality the same fact—the note being frequently repeated, cŭck-cŭck-koo, and in one or two instances cŭck-cŭck-cŭck, without the usual final koo. In Essex there is an old rhyme, a part of which is as follows, viz.:

> "May, they sing night and day;
> In June, they change their tune;
> July, away they fly," &c.

So that it would appear the change is not uncommon. So much has it been observed and known in this county, that the common mode of accounting for it is, that the eggs of small birds cease to be so plentiful as nature may require for perfecting the note, and hence the defect. *W. M. Fisk, Ely Bowers, Danbury, Essex.*

——Though I have not observed the change of note in the cuckoo in England, I have repeatedly done so, in several successive years, in Germany. The change which "Este" names appeared to begin towards the middle of June; the notes preserved their clearness for two or three weeks, then they became hoarse, then confused, and finally ceased to be heard before the end of July, perhaps somewhat earlier. *R. A. H.*

Descent of the Sap.—The agitation of such a question as you have suggested to your correspondents, in asking their opinions of what is meant by the "Descent of the Sap," is calculated to awaken attention to many facts that may bear upon the general theory of vegetation. I was glad to see the communications at p. 117, though I do not find in them anything that throws new light upon the subject. Without proceeding to search after the authority of old experiments in support of the general impression they have left upon my own mind, I consider the fact established (as I believe we all do), that an absorption of water, with whatever it may hold in solution, is constantly taking place through the extremity of the rootlets, and that this "crude sap" is carried forward, either through the intercellular passages or through particular vessels (of which there still seems to be need of better proof), or through both, by a force which acts "by propulsion," and not "by attraction," as Mr. Beaton supposes. The celebrated experiment of Hales upon the Vine, and the experiments of Dutrochet and others have sufficiently established this. If Mr. Beaton had cut away the two buds at the end of his Vine branch, he would have found it fill with sap, notwithstanding such mutilation; and if he had taken a portion of a perfectly dry branch, and held it vertically, and poured water upon the upper cut surface, this would have been imbibed, and ultimately have passed through and dropped out at the lower end. Moreover, in talking of "proving the simplest axiom in Euclid," he has forgotten that an axiom does not admit of proof; nor can it be assumed, as an axiom, that the sap descends as well as ascends in the way he describes; for trees are not transparent, and we cannot see this to be the case. We must test the fact by experiment, and his experiment is not sufficient for this purpose. But allow the branches to be filled as you will with crude sap, then, by exhalations through the stomata, a large amount of the water introduced is carried off, leaving whatever it held in solution still in the remainder of the water that has not been exhaled. The stimulus of light, acting on the cellular tissue in the leaves, or on certain stems that are not provided with leaves, enables these parts to concoct (if I may use the expression) those organic compounds—sugar, gum, &c., which are soluble in water, and are capable of being transmitted through the membranes of the cells themselves into the same spaces that are occupied by crude sap. Thus, a general diffusion of such organic compounds throughout the plant takes place. This diffusion has been termed the "descent of the sap." It is from these organic compounds that the general tissue, in whatever part of the plant, is developed. Whatever other compounds may be found, in particular parts of the tissue, may be derived from special functions of the tissue in those parts, after they have been supplied with the ingredients previously prepared in the leaves, and very possibly with other ingredients also among the various matters held in solution in the crude sap. I quite agree with you in supposing the starch in the tubers of a Potato to have been formed from the gum that was previously prepared in the leaves of that plant, and afterwards found its way to the tubers; and I am surprised to find the ordinary explanation of the fact has been doubted at all. I have the results of a very simple experiment (no novelty) which I prepared a few years ago, to satisfy the members of a farmers' club that the leaves of plants were far more absolutely necessary to the general development of their root-crops than they seemed to imagine. Two seeds of Ricinus communis were planted, one of which was allowed to grow untouched, till it became a plant about 6 feet high, and had put forth its flowers; whilst the other had its leaves constantly removed as soon as they began to expand. The cotyledons on the former specimen turned yellow and fell off, whilst those on the latter became intensely green, and were perfectly vigorous to the end of the experiment. Both plants were growing for the same period, but the mutilated specimen did not attain above 4 or 5 inches in height; and it must be sufficiently evident that its being kept alive at all was to be attributed to my allowing the cotyledons to remain. I think we cannot doubt that the return into the system of the materials elaborated in the leaves is necessary to the growth of all parts of a plant, and that this effect results from what has been called the "descent of the sap." Perhaps I have been too particular before alluding to the manner in which a wounded surface becomes covered with new wood, as I believe the view I have here taken is no uncommon one. Which side of a decorticated portion of a stem or branch is likely to be first and most efficiently healed, will depend, I should conceive, upon which side is best supplied with those organic materials which in solution have been called "the descending sap." I do not suppose that gravity has much to do with their general transformation, or that it affects the question at issue. Unless my memory fail me, it has been proved that the upper edge of the wound on a ringed branch, when purposely bent downward in order to test this point, has been found to form a larger amount of new tissue than the other edge (though this latter was now uppermost in position). Where there are no leaves or branches below a ringed surface, we cannot expect the supply of organic matter to be so great as above it. It could only be obtained from what had already been accumulated in the lower portion of the trunk, and would be gradually wasted, without fresh

additions being made to it; whereas above the ring the general supply would be even more ample than before, the ring intercepting its diffusion. In cases where a ring is taken from some part of a branch which is also supplied by organisable matter from a source below the incision, it seems probable that the difference between the new matter formed at the two edges would be very slight, and might even, in some cases, be greater at the lower edge than the upper. If a wound on the trunk of a tree should bear a small proportion to the whole surface, we might also expect very little or no difference between the amount of matter formed on different sides of the wound. That superabundant development of new matter which takes place round the immediate edge of the wound, and forming a swollen border, may probably arise from some additional stimulus produced by the morbid condition under which the tissue is placed, rather than from any special relation it bears to the course of the sap. Thus the expansion of galls, bezoars, and other excrescences, is induced by punctures and injuries at particular spots, and exhibit the results of a morbid action to a greater extent than we see them in the edges of such wounds as are inflicted by pruning. Of course in these cases there is something beyond the mere wound which is affecting the unusual growth of such excrescences; but still we may suppose that any unusual growth about the edge of an ordinary wound is in part owing to the result of a more actively induced secretion at those places. Similar effects are produced by ligatures; the common Honeysuckle (Lonicera periclymenum) furnishes us with spirally-channelled boughs of Oak, and other trees. In these cases the upper edges of the channels are frequently, but not always, the most swollen. Why the upper edges above a spiral ligature should be generally more largely developed than the lower, may possibly be in unison with what has also been stated to be the case, viz., that roots are more readily developed from the upper edge of a ringed branch than from the under. Perhaps, here, a greater energy may sometimes be exerted by the developing forces in a downward direction than in an upward, and yet this may be quite irrespective of the course of the sap.—*J. S. Henslow, Hitcham.*

Potato Disease in Ireland.—I am sorry to learn that disease is again beginning to show itself in Ireland, in the leaf and stalk, as well as in the shape of blotches on the tap roots. This may perhaps be the most favourable opportunity that has yet occurred for observing where the true seat of the disease is. Favourable weather, invigorating the vital force, has brought up the plant in the finest apparent condition, above ground. But is the tap root clean and white as it used to be 12 or 14 years ago? If Potato-growers generally will ascertain this, with the least convenient delay, and continue their observations until the Royal Agricultural Society's meeting, and be ready to report them there, this great point may be settled. In all my observations since 1845, I do not remember a single case in which the blight appeared above ground before the blotch on the tap root occurred; but many where the root was blotched and even ulcerated, whilst the plant above ground remained green and vigorous, so long as it was favoured by fine weather. *J. Prideaux.*

Thunder-storm.—We were visited here (Tonbridge Wells) last night by a dreadful thunder-storm. The day had been oppressively hot, the thermometer in the shade indicating 85°. Towards the afternoon distant thunder was heard, but it did not become alarming until half-past 11 at night, after which the peals of thunder shook the houses to their foundations, and the lightning flashed so vividly that I could distinctly tell the time on my watch-dial. A few minutes after 12 o'clock I heard a sudden crash, which I expected to be the destruction of some of the hothouses; but I discovered next morning that it was a fine Poplar which had been struck by the lightning. I found pieces of the bark within a few paces of my cottage, which is 50 yards from the tree; long strips of wood in the shape of laths, and "Mistletoe boughs" (with which the tree was beautifully clothed), were strewed around in all directions. Several houses have been injured, but I have not heard of any lives having been lost. *J. Rust, Eridge Castle, June 27.*

Hard Words.—I wants to now, Mr. Edditur, what u meddels with hour nams fur. Hear as I bin a larnin them names o' plants all mi lif, an now u says ta'nt o' no yeuse; i shud lik to now why *saucidacious* plants shouldent be call'd so isted o' *aukids.* I can't see nuthing in 'em lik a kid, an master says no more can't hee. To be suur theyr aukard enuff to grow; praps that's it. *Merredith.*

Societies.

Botanical, of London, *June* 14.—A. Henfrey, Esq., in the chair. Various donations having been announced, the Chairman read a paper "On Sagina apetala, L., and S. ciliata, Fries; with some remarks on the mode of discriminating species." After alluding to a paper by M. Beneken, published in the "Botanical Gazette" for April 1849, and another by Mr. Babington on the same subject, which appeared in that journal in July, 1849, the author stated that he had investigated many specimens of the plants, English and French, derived from his own collections, from the herbarium of Dr. Cosson, of Paris, together with an English example of S. ciliata, named by Mr. Babington, and authentic specimens of S. patula, Jord., from that author. The conclusion he had arrived at was that the S. ciliata, with which S. patula, Jord., appears to be identical, as stated by MM. Grenier and Godron, is but a variety of S. apetala, L. He had found the mucro on the sepals inconstant on the same plant, occurring on specimens with all the other characters of the form taken as the true apetala. The degree of divergence of the sepals in the fruit, he was inclined to attribute to the existence and size of the petals, which are persistent. The form apetala (which has petals and is usually ciliated), grows on drier and more exposed spots; the form ciliata generally in the shade, or damper situations. The author then drew attention to a plan of determining critical species which are at present so perplexing to European botanists, as he thought that by the aid of some of its country members the Botanical Society might do much towards settling the question in many cases. Regarding condition, such as aspect, climate, soil, &c., as the usual cause of variation, he did not look upon the cultivation of a plant in artificially prepared land, in one place alone, as a satisfactory test of the value of characters, as artificial culture has rather a tendency to perpetuate varieties than to reduce them to their types. He suggested that a few, say six to 12 botanists, residing in as distant parts of the country as possible, should form an association for cultivating critical plants, all corresponding with a metropolitan botanist, who might cultivate here also, and who should receive from any source specimens of plants to be carefully preserved, together with seeds to be distributed to all the cultivators. These should make a return annually of specimens of the plants they have raised, with their remarks, and when a change has taken place, seeds also to be re-distributed. By the help of a certain number of co-operators, one residing in the west of England, another in the east, another in the midland counties, others in the north, and in the different climatal regions of Scotland; or, if it were possible, by the help of a member residing in every one of the districts, given in Mr. Watson's Cybele, the doubtful forms might be exposed to every variety of condition, while the preservation of the original type specimens would render all the observations at once applicable as exact scientific evidence. If a number of provincial botanists will agree to carry on these observations, Mr. Henfrey stated that he was willing to take charge of the metropolitan part of the work, to receive and distribute the specimens and seeds, and also to cultivate them for the London climate in the Garden of the Royal Botanic Society.

Botanical, of Edinburgh, *June* 13.—The President in the Chair. Dr. Balfour announced that the Commissioners of Woods and Forests had agreed to form a Botanical Museum in the Garden. Mr. Priestley read a paper on some British Carices. Mr. C. Lawson, jun., read a communication by Dr. Hoffmann, on the Roots of Umbelliferous Plants. Mr. Evans directed attention to a curious instance of the effects of the graft upon the stock, which had occurred in a tree at Morningside House, the residence of Mr. J. Deuchar. The tree in question is Pyrus Aria, grafted upon P. aucuparia as a stock. Its entire height is 18 feet, and the stock forms a clean trunk to the height of 4 feet, where the union of the graft and stock is conspicuously shown. At 13 inches from the base of the trunk there are shoots of P. aucuparia, and at the height of 1½ foot branches of P. Aria appear (being 2½ feet below the point of junction), while farther up the trunk a branch has been accidentally taken off, which is believed to have been P. aucuparia. Mr. M'Nab exhibited a peculiar creeping form of Sarothamnus scoparius (Common Broom), which had been sent from Alderney. Specimens of the fruit of Atropa Mandragora, and of the ripe fruit of Alströmeria acutifolia, were exhibited, the latter having been sent by Mr. M'Intosh of Dalkeith. Mr. M'Nab made a communication on the effects of Lightning on Trees. He remarked:—"A few days ago I accidentally heard of a tree which had been struck by lightning on the 5th inst. (June, 1850), at Pitferrane, Fifeshire, the residence of A. Buchanan, Esq.; and, being anxious to ascertain the species, I wrote for a small branch, with any history which could be given regarding it. I have just received the leaves shown, which prove it to be the Ulmus montana, or Wych Elm. About this time last year a very large Oak on the grounds of John Wauchope, Esq., of Edmonston, was shattered to pieces; and a few years previously a Laburnum standing close to the Oak was likewise destroyed. While on a tour over a portion of the American continent some years ago, I had several opportunities of observing gigantic trees torn to pieces by electric influence. In every instance I observed they were Oaks. During a thunderstorm I found the workmen (chiefly in Canada) resorting to the Beech trees for protection, from an idea that they were not liable to be struck by lightning; certain it is that I saw none, notwithstanding the prevalence of large sized Beeches in many districts. The Elm above alluded to at Pitferrane had an iron fence standing close to it, which was supposed by the inhabitants to have had some influence in attracting the fluid. The above observations are thrown out, in the hope of ascertaining if there be anything in the composition of one species of tree rendering it less liable than another to electric influence." Mr. Brand stated that he knew a marked instance of a Beech in Aberdeenshire having been struck by lightning. The Horse Chestnut and Ash were likewise mentioned by other members as having been struck.

Meeting at Worton Cottage, *June* 25.—The extremely sultry weather has proved most unfavourable for flowers sent by post, as will be seen by the following report. Pelargoniums: "A. W. G's" flowers had fallen all to pieces, but enough remained to show that they were not sufficiently distinct to render them worth keeping. With much high breeding, and many points of excellence, we fear that there is nothing in "T. E.'s" flowers surpassing varieties already in cultivation. Primate is the best in form and colour, it is a great improvement upon the Vicar; Archdeacon has capital top petals, but very inferior lower ones; Abercrombie will not do. A large box of blooms sent C. S. Stapleton were a mass of petals, but had they been in the best condition they would have been worthless. Pansies: Mr. Lightbody sent a bloom each of Sir William Allan and Lord Jeffery; both arrived in very bad condition, owing to the warm state of the weather. The same must be said of his Ranunculuses, which had fallen entirely to pieces. Calceolarias: "W. H." supplied single blooms of several varieties, but they came in a sadly disfigured state; enough, however, remained to show that they are, in most respects, fine flowers. Fancy Pelargoniums were placed on the table by Mr. E. G. Henderson, and a very good selection they were; some for the amateur, more for the nurseryman. Mr. Andrews was directed to make a drawing of three of them, viz., Beauty of St. John's Wood, Exquisite, and Princess Royal. A Delphinium flower was produced by the same nurseryman, large, handsome, and desirable as an addition to this valuable tribe of ornamental border plants. Potentillas and several other articles were present, but they were past all judgment, from the unfortunate state in which they arrived, attributable to the weather alone. Pinks: Mr. Turner, of Slough, sent a box containing nine blooms of his seedling Sappho, a very useful flower, moderately smooth and bold, colour bright rosy purple, and constant; it was handed to Mr. Andrews to take a coloured memorandum of, in case nothing better appeared during the season. Rosalind: of this there were two blooms; it is a very distinct variety, but far too irregular in its lacing. Pindar, a dull purple, not sufficiently smooth; and blooms of Huntsman, Harriett, and Whipper-in accompanied the above. Who shall send Fuchsias fit for an illustration? The only ones present this day, from Deal, were sadly mutilated from careless packing. The flowers were large, but coarse.

Reviews.

Concise Notices of British Grasses best suited to Agriculture, with preserved specimens of each kind. By D. Moore. 2d Edition. Dublin: M'Glashan. Folio. Pp. 80.

On the Cultivated Grasses and other Herbage and Forage Plants. By Peter Lawson and Son. Edinburgh: Lawson. 4to. Pp. 48.

These two works should be in the hands of every gardener, land-steward, and farmer. Though occupying little space, and having few pretensions to the character of fine books, they contain a rich fund of sound, practical, and most useful information concerning the different purposes to which different kinds of Grass are found by experience to be applicable.

Mr. Moore's work contains well dried specimens of all the common agricultural Grasses,—and no figures are equal to these natural representations—with valuable instructions for employing them in Ireland. Messrs. Lawson's book is a reprint of their well-known pamphlet, with such additions and improvements as increased experience shows to be necessary. Both contain tables of the quantity of seed required for an acre of land, whether for lawns, permanent pastures, alternate husbandry, &c., and on different soils; and both give different opinions; Mr. Moore's advice being intended for Ireland, Mr. Lawson's for Great Britain. What surprises us is the much larger quantity of seeds required per acre in the former than in the latter country. We presume that the explanation is to be sought in the different condition of cultivated land in the two cases.

Miscellaneous.

Wasps.—The Earl of Burlington having commissioned his gardener, Mr. Wilson, to give a penny each for every wasp brought to him that may have been caught in or about his lordship's gardens, from the 23d of April up to the present time, he has received no less than 2364. As every wasp killed at this time of the year is a nest destroyed, the number thus prospectively abolished is almost incalculable. *Old Bell's Messenger, June* 24.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

This is a good time for grafting or inarching Oranges, Camellias, Azaleas, choice Rhododendrons, &c. For grafting, forward ripe shoots of this year's growth are generally selected; but of small weakly growing kinds, it is preferable to take a portion of two-year-old wood along with the shoot. Until a junction is effected, the plants should be plunged in a close moist heat, rather stronger than that required for growing them in, and carefully shaded. Many other puny-growing, fine-rooted, stove and greenhouse plants may with great advantage be grafted on stronger growing species of the same kinds; amongst these we may mention Gardenia radicans, Ixoras, Chorozema Henchmanni, Pimeleas, Leschenaultias, &c. Seedling Cinerarias, for autumn

and winter-flowering, should be potted as they require it in light rich soil, containing about one-fourth of loam. The plants obtained by dividing the old ones of approved sorts should be stimulated into vigorous growth, to produce fine specimens for late flowering, by repotting them progressively as soon as the roots reach the sides of the pots. It will, however, be advisable to retain a portion of the plants in small pots, for flowering during autumn and early winter. Old plants of Chinese Primroses should now, after their partial repose, be shaken carefully out of the old soil, repotted in light sweet compost, moderately rich, and placed in a warm frame for a few days, till they have begun to produce roots into the new soil, after which they must be removed to a position near the glass in a cold frame, and kept close till the plants are thoroughly re-established. These plants succeed best in moderate-sized pots.

FLOWER GARDEN AND SHRUBBERIES.

Perhaps no plants are more generally useful than the hardier kinds of Carnations, Picotees, and Cloves. Their beauty and fragrance not only recommend them to a prominent place in flower beds, but render them invaluable for glasses or bouquets. If pipings of them are taken off about this season, they sometimes strike as freely as Pinks; but the operation will be more certain to succeed if the handlights are set on a slight hotbed, or the pots plunged in a frame where there is a gentle bottom-heat. Points which require special attention are, that the cuttings be taken not later, on any account, than the expanding of the first flower; and that they be carefully shaded from every ray of sunshine. The most certain method of propagating them is by layers; but it is equally important that it should be done early, as the plants root sooner, and thereby become better established before winter. But in all cases, it will be found the most satisfactory mode of proceeding, to defer the transplanting of Carnations raised from layers, till the spring following; as they are liable to be thrown out of the ground by frost in winter. And in unfavourable localities, it becomes necessary to remove the young plants to a frame during winter. Late sown annuals, intended for autumn flowering, should be thinned out or transplanted, before they crowd one another, and become too weak to support themselves; choosing moist weather for the operation. Timely tying, staking, and regulating of all plants, is of much importance, both as regards the effect produced, and the time occupied in doing so.

KITCHEN GARDEN.

As every available means should be adopted for stimulating the various crops into a vigorous growth, let due use be made of liquid manure, if this valuable auxiliary is available. This is the best time of year to make use of it, by applying it to every plant which it is desirable to stimulate into very vigorous growth, as the object in the cultivation of plants for the sake of their roots, stems, or leaves, is to induce a luxuriant growth, and to prevent or retard the production of flowers or seeds. Make every provision for autumn and winter, by planting good breadths of Brussels Sprouts, Cabbage, Savoys, Broccoli, and other winter vegetables, taking care that the ground be previously well manured. Let there be no idle ground in this department; but, as the quarters are gradually cleared out of their summer occupants, let them be succeeded by something else. Celery planting should also be completed with the least possible delay. Sow Chicory, Endive, Parsley, American Cress, &c., for winter; and Lamb Lettuce or Corn Salad for late autumn use. Kidney Beans, Peas, and other crops with weak collars, should be earthed up before they are blown aside. A supply of Watercress for the autumn and winter may be easily obtained by planting some strong young tops, about 4 inches long, in a line at the foot of a north wall. The cuttings should be of pieces which are protruding roots from the joints. The Watercress will grow freely in such a situation; and in many places where there are no artificial beds, and where natural ones are a considerable distance off, these will be found very useful.

State of the Weather near London, for the week ending June 27, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

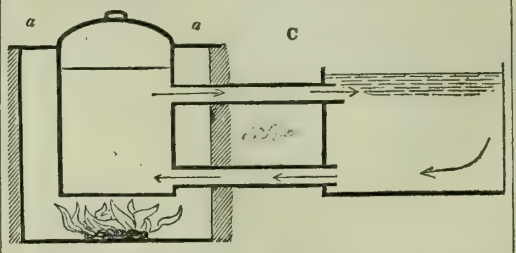
AMERICAN BLIGHT: *R C.* There is no excuse for allowing trees to become infected with it; wash the branches with spirits of tar, very strong vinegar, or oil. Apply them with a painter's brush.

AMERICAN FORCE-PUMP: *G T.* It is a double action force and suction pump, worked by a horizontal lever, resting by its middle on a fulcrum between the two pumps. By attaching a hose to the discharge-pipe, it is stated to be capable of throwing water, or liquid manure, a distance of from 30 to 40 yards, but we have had no experience of its working.‡

BEES: *L* asks if any one has observed a deficiency of drones in their stocks this season? Out of seven stocks he has four in which he has not seen a drone this year. One of the four has sent off a strong swarm. He was standing by the hive during the rush out of the new colony, but not a drone could he see going forth with it. It has been active and apparently prospering ever since.

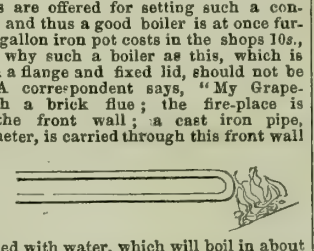
CUCUMBERS: *T P G.* No doubt your Cucumbers are attacked by gum, which arises from their roots taking up water faster than the leaves can part with it. The true remedy is a perfect ventilation of the Cucumber-house, without the admission of cold air.

DEODARS, &c: *W E.* See last week's Number, p. 392.‡

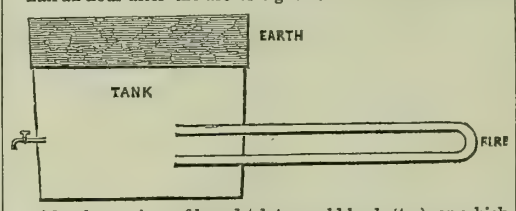


DEUTZIA SANGUINEA: *A H* asks on what ground is this plant so named? We never heard of such a plant. It is probably a blunder for *staminea*.

DIGITALIS: *Dble Yew.* It is a most singular production, concerning which we shall have something to say as soon as a woodcut, now in preparation, is ready.

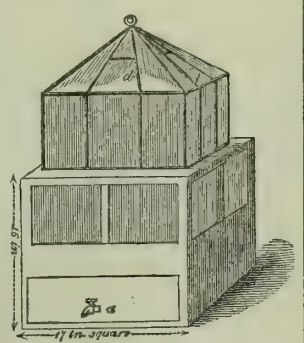


EMIGRATION: *A F Z.* Your only way is to procure the works on Colonies, published for the use of emigrants; or to consult the agents of the different companies.



GRAPES: *Derbyshire Sub.* Grapes now ripening will do well with a temperature of from 70° to 85° by day, and from 65° to 75° at night. Admit plenty of air during the day-time, and a smaller portion at night. The same temperature will suit your Vinery that is to ripen its fruit some six weeks later. *F.*

HEATING: *S V.* We should imagine that by means of simple contrivances like the following, or modifications of them, sufficient bottom heat might be obtained for striking a few cuttings, or raising a few seeds where there is no hotbed at command. 1st. Let us take section C, which represents an iron



saucepan with a lid fastened down by a bayonet catch, and adapted to the tank by a flow and return pipe. By casting a flange *a a* upon the upper edge of the saucepan, 6 inches deep, sufficient means are offered for setting such a contrivance in brickwork, and thus a good boiler is at once furnished. A common 6 gallon iron pot costs in the shops 10*s.*, and we see no reason why such a boiler as this, which is nothing but a pot with a flange and fixed lid, should not be sold for 15*s.* 2d. A correspondent says, "My Grape-house is heated with a brick flue; the fire-place is about 3 feet from the front wall; a cast iron pipe, about 2 inches in diameter, is carried through this front wall to the fire-place, thus: The two open ends of the pipe are introduced into a wooden tank, about 2 feet long, 4 feet wide, and 18 ins. deep. This is kept filled with water, which will boil in about half an hour after the fire is lighted. The tank is covered

with a large piece of board (slate would be better), on which rests a wooden frame about a foot deep, and filled with earth, which is always warm enough to strike cuttings or raise seeds in. The tank is, however, too small, and if not well attended to it gets overwarm. The pipe would heat a much larger tank." 3d. The following cut gives a view of a little portable greenhouse, which is readily taken to pieces, can always be ventilated, and may be heated like an ordinary greenhouse. The apparatus consists of a stout box, the upper half of which has panes of glass let into its sides, on which a moveable glass roof, like a hand glass, is placed, and in the bottom of which slides a copper drawer or box, which may contain hot water. An open shelf is fixed over the latter, upon which pots may be placed. In cold weather the copper drawer is filled with hot water night and morning, and in this way tender plants have been wintered, seeds raised, and cuttings struck. *a* is the copper drawer, furnished with a cock, which serves as a handle, and at the same time is used for turning off the water when cold; *d d* are doors in the roof.

INSECTS: *Old Sub.* Insects sent to be named must be forwarded so as to arrive in a determinable state. Yours, folded up in a little bit of paper, were completely destroyed. One was the small brimstone moth (Geometra cratægata); another was some species of Phryganea; the others quite unintelligible. They have nothing to do with the absence of the cuckoo on the Malvern Hills. *W.—T D H.* We could discover no insects, even with a lens, in the box of sand. *W.—M J B.* The larvæ with which the Turnip-pods are infested appear to be those of a species of Cecidomyia, or gall midge. The fact is quite new to us. We will endeavour to rear them, and hope you will do so too. They will most probably go into the earth, to undergo their changes. *W.—L R F.* Julus sabulosus. *W.—J C M.* The Mangold Wurzel leaves are infested with the grubs of the two-winged fly belonging to the genus Tephritis, which we will endeavour to rear. Leaves much blotched should be picked off and burned. *W.—S and J D.* The Hollyhock leaves are gnawed by myriads of Chrysomela Polygoni, a little beetle found generally on the common Mallow, very like the Turnip fly or Jack, but which has not the power of leaping. Shake the plants sharply, placing sheets of paper on the ground daubed with pitch, which will secure the insects. *W.—B.* The insects on the red Currant twigs are females of a species of Coccus, apparently identical with that of the Vine, Coccus vitis, with the cottony matter filled with eggs, which will very shortly hatch and produce the young active nits; it would, therefore, be well to cleanse the trees forthwith by hand picking. *W.—J H S.* The beetles sent are the common Hylobius Abietis, one of the most destructive species of weevils. The destruction of the perfect beetle can scarcely be effected, but as they breed in the old stumps these should be rooted up and burned, and young trees if much infested with the larvæ should also be rooted up. Cut branches laid on the ground in the vicinity of healthy trees are a good decoy. *W.—G D.* Your furniture is attacked by the common furniture beetle, Ptilinus pectinicornis, which will not, however, touch the mahogany. If you can manage to do so it would be well, now that the insects are arriving at the perfect state, to place the pieces of furniture in a spare room and fumigate them well for several days with burnt brimstone. The destruction of every beetle now seen ought to be carefully effected. We have by that means saved our own furniture. *W.—T S P.* Thanks for the piece of wood sent from Pembroke dockyard. The Lymexylon is a long, narrow, soft-winged beetle, something like one of the soldiers and sailors, as they are called by children, now so common in gardens. They are probably imported, the insect being a very rare native species. The name is generally pronounced with the accent on the second syllable. We shall be glad to know the result of putting the wood in the steam-kiln. *W.—T C.* The insect of which you have sent a sketch is the common British Membracis cornuta. The flies are not moths, but belong to the order Trichoptera (Phryganea, Linn). 1, Leptocerus niger; 2, Goera fusca? 3, Sericostoma maculatum Pictet; 4, Phryganea —— ? *W.*

IRIS: *A H* asks will any, and what, Irides, besides the wild Iris Pseud-acorus (assuming that *that* will), live in water?

LARCH BARK: *Anon.* It is selling at present at 3*l.* per ton, which is half the price of Oak bark. When made ready for the fellmonger, it will cost 2*l.* 15*s.* per ton, leaving a profit of 5*s.*; which is more loss than gain, as the unpeeled Larch is worth more by 1½*d.* per foot than that which is peeled.

MIMULUS: *J C.* Rubinus and ruberrimus are names given to a variety of Mimulus raised by Messrs. Clapham and Co. It was first called rubinus, afterwards ruberrimus.‡

NAMES OF PLANTS: *J M K.* It is common Woad—Isatis tinctoria.—*O P.* Berberis aristata, a common plant.—*Edward Thompson.* A seedling Jasmine! why, it is the common Tecoma jasminoides.—*A L S.* This is a very poor specimen to judge by; but it appears to us to be a form of the Parsley-leaved variety of Athyrium Filix-fœmina. *S.—C Bar.* A red variety of Rosa spinosissima; Sedum acre.—*H R J.* Crataegus punctata.—*A Constant Sub.* Not in a state for determination. One morsel looks like Brachycome iberidifolia.—*J B.* Campanula glomerata; Bangia fusco-purpurea.—*T W.* 1, Vicia lutea; 2, Arenaria ciliata?; 3, Potentilla verna.—*G H K.* All Brome Grasses; and all varieties of Bromus mollis.

ORANGES: *R C.* You are perfectly right to turn your Orange trees out of doors, as soon as frosts are gone.

PEACHES: *Derbyshire Sub.* They require plenty of air, to give them flavour and colour, with a temperature of from 65° to 70° by night, and from 70° to 85° by day, according as the external temperature is high or low. At this season artificial heat is not required during very hot weather, but only when the thermometer gets down nearly to the minimum of the temperatures you wish to maintain. *F.*

PEARS: *An Irish Sub.* The leaves are attacked by a fungus called Fusisporium griseum. Better try flowers of sulphur early.

PINE-APPLES: *A Derbyshire Sub.* Maintain an artificial heat in your fruiting Pinery of from 70° to 85° by day, and from 65° to 70° by night. This temperature will be exceeded naturally in hot weather, unless you take means to prevent it, by shading during sunshine, and giving air at night; both of which practices, under skilful management, are good. The thermometer must be your guide as to the time for applying artificial heat, in the morning and evening. The bottom-heat for fruiting Pines should be from 80° to 85°, at the depth of 9 inches from the surface. If you cannot obtain this heat by adding a few inches of tan to the surface, between the pots, then it will be necessary to remove the plants, turn the old tan, and add a sufficient quantity of fresh material. We presume that you have no tanks or pipes for bottom-heat, which would save you this trouble and expense, as well as prevent the plants from being checked every time they are taken out of the pits. *F.*

POLYGALA: *A H.* The beautiful blue and pink herbaceous Polygalas of our pastures may be cultivated without difficulty. They are much improved by it.

STRAWBERRIES: *John St.* Your letter makes us smile. What you think a feat is, in our eyes, a very sorry performance. Why, it is little more than 1 oz. per pot!

SWANS: *W C* will thank some one to inform him what size a piece of water must be to keep a swan on? also, whether a single swan will remain quietly? and whether swans will devour trout? He has a small pond in which there are trout, and the beauty of the water is entirely done away with by a nasty green scum, which, he has been told, a swan will clear.

SWIMMING BATH: *Falcon* states that he has found bricks or stone set in well-tempered clay, and the back of the wall well puddled with the same, to hold water better than cement, which is apt to crack if the frost reaches it.

VALISNERIA: *F N E.* Seek for this in botanic gardens, and for water snail in the Thames.

VINES: *Col B.* The reason why Vines throw out roots along their branches is, that the atmosphere of the Vinery is very hot and damp, at the time when the border is cold. The real roots having little power of action, the branches throw out supplemental roots into the warm damp air, as if for the purpose of seeking therein the food which the chilly border denies to the ordinary roots.

WAGES: *A Subscriber.* It is a legal question, upon which we can express no opinion.

SEEDLING FLOWERS.

CALCEOLARIAS: *C T P.* See p. 376, signature "Anon." If these were not your seedlings, and you will be kind enough to send us fresh specimens, we shall be glad to notice them.*

PANSIES: *G R.* Pale sulphur, tinged with purple; eye good, substance bad. The warm weather had too much shrivelled it up for us to judge of its shape.*

PELARGONIUMS: *W C.* "Kossuth" is apparently a flower of good colour; but that is all we can say of it, for it had fallen to pieces before it reached us, as had also your other seedling.*—*R W.* Clean looking, and a good trusser, but worthless as a "show flower."*

PINKS: *E C.* A flower of superior quality, but much too small for the purposes of exhibition.*

RHODODENDRONS: *J F W.* The white variety is like maximum, and the purple one is in the way of roseum splendens. Both are neat close-headed kinds; but not equal to many now in cultivation.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

GUANO AND OTHER MANURES.—Superphosphate of Lime (See reports of experiments in Royal Agricultural Society's Journal, Vol. 6, Part 2), Guano, Peruvian and Patagonian, Gypsum, Salt, Nitrate of Soda, and all other Manures of known value on sale. A Pamphlet on the above forwarded on receipt of four postage stamps.—Apply to MARK FOTHERGILL, 201A, Upper Thames-street, London.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10	0	0
Clover Manure, do.	11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

HOT WATER APPARATUS AND HORTICULTURAL BUILDING.

W. HILL begs respectfully to announce that his improved "FLUE BOILER" may now be had in sizes to suit every description of Apparatus, from that of 100 feet to 2000 feet of 4-inch pipe. Improved STEAM BOILERS, from one-horse power and upwards, adapted either for stationary or portable engines, and guaranteed to be most effective.

Every description of Horticultural Building constructed upon the best principle. Buildings of any kind heated by hot water.

*** A liberal Discount to the Trade.

W. HILL, Horticultural Works, Greenwich.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

The terms of the School can be had on application either personally or by letter.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

The Agricultural Gazette.

SATURDAY, JUNE 29, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, July	3	Agricultural Society of England.
THURSDAY, —	4	Agricultural Imp. Society of Ireland.
WEDNESDAY, —	10	Agricultural Society of England.
THURSDAY, —	11	Agricultural Imp. Society of Ireland.

THAT "You may drive a coach and four through any Act of Parliament," is an assertion which has become general from the failure of any measure to meet all the contingencies comprised under any one appellation. Yet many of our farmers believe their welfare and prosperity to depend in a great degree upon their obtaining a legislative enactment to enforce tenant right.

For any decree to be universally effectual, it must be based upon "fixed" and fundamental principles of practice; but, where are they to be found in our farming operations? Nowhere. Every parish in every county has many practices totally different and opposite in their operation. Nay, more—what one farmer considers best on his farm, his neighbour considers quite wrong.

If we ask what is tenant right, we are told "compensation for unexhausted improvements," viz., draining, lime, chalk, marl, purchased manures, acts of husbandry, &c. "Compensation for unexhausted improvements" is only another expression for compulsory order on the landowner or his tenant to purchase an out-going tenant's expenditure or investment, to obtain which order, justice would demand that the expenditure of the amount claimed had not only been made with due economy and caution, but that it was, considering all the circumstances of the case, the best and cheapest mode of procedure to obtain the necessary effect. But, are attempts at farm improvements always made with proper care and discretion? Far from it. Blundering and chance-medley are too often characteristic of the operations intended for agricultural improvement. It is quite possible for any man to lay out money for which he expects an adequate return, but in reality neither he nor his successors may ever receive anything; witness many of our railways—the holder exhibits certificates for the amount which he has invested, and which are absolutely worth nothing; this is also the value of very many of the farmer's intended improvements.

An outgoing tenant says, "I have expended *l.* in the drainage of the farm; there is the bill for tiles, and here is the labour account." "What!" exclaims the landlord or incoming tenant, "7*l.* per acre, and after all it is not half done; were I to employ a competent engineer he would perform the drainage in a much better manner for 4*l.* per acre. The drains are only 3 feet deep, and laid in the wrong direction; the tiles are of bad quality, and the work cannot remain permanent—I won't pay for it."

If the outgoing tenant determines to rely upon his tenant right act, evidence must be received. One says, in such stiff land 2 feet is deep enough; another thinks three better. Per contra—if the drains had been laid at a depth of 5 feet, with a greater distance between them, the drainage would have been perfect, and the cost would not have much exceeded one-half of what is claimed. Who is correct, and what is agricultural truth?

A few weeks since we walked across a field in course of draining at a depth of 18 inches, in a stiff clay; the drains were cut with a common spade, and 8 inches wide at bottom; the flat-bottomed pipes were of miserable quality, some of them turned up at one end and down at the other, making a tolerable approach to the figure 8; many had pieces broken off their ends and sides, and to make the "jointure" perfect a stone was placed upon each hole. With such a width at the bottom it is impossible to lay the pipes so as to insure their continuity; and in this instance they diverged from one side to the other, reminding one of a snake in motion. Such drainage cannot remain permanent; it is just possible that a contorted and defective drain may inexplicably run much longer than could reasonably be expected, and continue to do so when all the rest are silted up, but, wherever bad workmanship and bad materials are used, no reliance can safely be placed upon the permanent drainage of the soil; and to us it seems impossible that these drains can escape being silted up the very first heavy rains that fall. The stones on the holes certainly afford little guarantee for keeping out the earth. A large sum has been expended for the expected benefit to be derived from such drainage. If we were the incoming tenant to the farm to-morrow, we should be sorry to give the present tenant as many shillings as he has sunk pounds in the drainage; and it would be a deep injustice to enforce from any one compensation for such a waste of money. He intrusted the performance to the "Village Conjuror," whose only qualification was that he "had been draining all his life, and had cut more drains than any one within 100 miles of the place."

As to the other particulars to be specified in any bill for enforcing the repayment of his unexhausted improvements to an outgoing tenant, we may just refer to the differences, not merely of opinion but of fact, as regards the value of one and the same investment in different localities. Take the instance of food for cattle—the very point on which a division unfavourable to Mr. PUSEY's bill took place in the House a few days ago. The value of the manure from the consumption of any purchased cattle food depends materially upon the nature of the growth to which that food has contributed. Manure is food *minus* growth. And that from young cattle or milch cows is, as every farmer knows, very poor stuff compared with that of full-grown fatting stock—whatever their food may have been.

"What is the value of a ton of Turnips" has been very freely argued in this Paper, and the result shows that independently of the price obtained for the produce from a ton of roots, the actual feeding value of Turnips is influenced by many circumstances—soil, manure, climate and cultivation, each exercises its influence.

Again as regards the effect of manures:—A very bulky crop of roots may not be so valuable for food as another crop of less weight, yet to the incoming tenant the feeding value should alone be considered; and who has yet ascertained it relatively between roots raised with all our purchased manures, or rather all the manures which the farmer may purchase, not forgetting brown loam at 7*l.* per ton, and under all the circumstances of soil, climate, and cultivation.

The object of all good farmers ought to be, and of an Act of Parliament for agriculture certainly should be, the production of the utmost quantity of animal and vegetable food through the medium of perfect fertility. That happy acme once attained, there would be no need of purchased manures. The manufacture of the utmost quantity of animal food would produce the utmost quantity of manure, and this again the utmost quantity of vegetable food.

And as to the tenant right in respect of buildings: how many questions must be answered before it can be rightly expressed! Given a certain number of acres of arable land, for what number of cattle should there be accommodation?—"One for 10 acres, or one for 5 acres?" and some lover of high farming would probably chime in, "one for 2 acres." The want of proper accommodation for his cattle is one of the greatest evils to the farmer and the farm: the means of providing an abundance of manure will be more beneficial to both than a world-wide tenant-right act. The landlord ought to provide either houses, in which a farmer might manufacture a sufficiency of manure, or the manure itself; but what proportion the house-room should bear to the extent of arable land has yet to be demonstrated, and the farmers themselves must do so (this would be a proper subject for discussion at our agricultural clubs).

But this does not exhaust the subject—"Should there be house-room for sheep also, and to what extent?" The farmers must by discussion among themselves reduce these and many other knotty points to a certainty before they can expect the gentlemen of wigs and long robes to understand a measure including such terms as these.

Until our farming practices become fixed and defined, it is impossible to believe they can be controlled by one comprehensive measure, which in its operation would be found useless and paradoxical in the extreme; at the present day they are such a mixture of incongruities that we fear, under evidence regarding them, a jury would often be forced to perform the "poker trick"—"if it falls to the right, it is to be for the plaintiff; if to the left, for defendant; but if forwards or backwards, then there is no hope of our agreeing." That tenant *right* has existence, we do not deny; on the contrary, we contend for its recognition by landowners, as being evidently for the interest of all parties; but that it can be enforced by legislative enactment we do not believe. *T.*

OUR readers may remember the statements made in past volumes of this Journal, in reference to the farms of Mr. BATSON, at Kynaston, near Ross, and Mr. WHITMORE, at Dudmaston, near Bridgenorth—where successful exertions have been put forth to employ boys in agriculture at wages equal to their maintenance, in exchange for labour which should be profitable to the farmer. Now, an institution has been lately established near London, styled the AGRICULTURAL ORPHAN SCHOOL, which seems to offer a reasonable prospect of success in the effort to withdraw from ruin in the streets some of that multitude of poor children who, deprived of their parents, are exposed in this city to all the evils and temptations incident to poverty. We refer to the subject here because such a society seems peculiarly deserving of assistance and support* by the benevolence of agriculturists. The following passages, from the prospectus of the Society, sufficiently explain its objects:

"The early employment of children in agriculture, which is a subject of complaint in all rural schools, is, apart from any details of particular experiments, a proof of the value of their labours. These labours commence earlier than the labours of children engaged in manufactures; and as compared with the wages of adults, children employed in agriculture are higher paid than those engaged in manufacture. It may then be inferred that their labours are proportionally more

* The Hon. Secretary is the Rev. W. DENTON, Incumbent of St. Bartholomew's, Cripplegate.

valuable. In many parts of England the wages of children of 12 years of age amount to 4*s.* a week; but in very few places indeed will the necessary maintenance of such a child exceed his earnings. We may then assume as a general rule, that a child employed in agriculture, by the labours of his hands more than provides for his own maintenance. And this conclusion is amply borne out if we examine the results of particular experiments. On Mr. BATSON'S farm, near Ross, we find 20 boys, of ages varying from 9 to 14 years, boarded, lodged, and instructed, and yet returning a profit to their employer. They have been so employed for nearly three years, and the advantages to both children and employer have been yearly increasing. A statement of these results may be found in the 'Labourers' Friend' for August, 1848; and in an interesting communication made to us by Mr. BATSON, at the end of another year, he states himself more satisfied with his experiment (if it can now be called so). 'I have at all times,' he says, 'found the boys' work on my farm to more than realise my first expectation.' Again in the Quatt Union-house school, near Bridgenorth, on an area of 4½ acres, the same experiment has been tried, and with similar success; 15 boys of all ages under 14, together with the same number of girls, some of whom are employed in household and dairy work, under judicious management, have by their industry paid the rent, and produced 65*l.* net per annum towards the expense of their own maintenance. These two instances, one conducted by the energy of an individual, the other labouring under the disadvantages of a board of conductors, might not have been entitled to much weight, had not the results been identical with the general fact of the value of boys' labour throughout the country.

"Nor is this value confined to those cases where they are able to attend on and assist the adult labourer, children being found competent, with some little assistance from men, to perform all the labours which usually devolve upon a farm servant. In some partial experiments made a few years since, the results of which are detailed by the late Mr. Duppa, in a paper published by the Central Society of Education, the returns from the labour of children employed during a part of the day in gardening was most encouraging. The late Mrs. Davies Gilbert, seeing the advantage to children of such a training, and its tendency to diminish the expenses of education, established agricultural schools on her estate for the children of her labourers. But here all her efforts were fruitless through her success. The partial training of these children in farming-work so greatly increased the value of their labours that the parents were tempted, by the high wages offered, to withdraw their children from school. A proof of the enhanced worth of skilled labour, and a singular instance of failure through success.

"Now these facts sufficiently prove the capacity of children; and yet in the face of these, next to nothing has been done for the destitute children of London. After long consideration it has been resolved to commence an Asylum for the poorest class of orphans, provision being made:

"1. For the industrial training of the children in agriculture, with a view to the diminution of the expenses of the establishment, and the early inculcation of the connexion between labour and maintenance.

"2. To avoid the system of crowding a large number of children in one building, but by breaking them into small groups or families to reconstruct, as far as possible, the homes of which they have been deprived; and thus to foster and mature the domestic affections, which make up so large and important a part of man's moral nature.

"3. To provide for the emigration of the orphans, when arrived at such an age as to be able to maintain themselves without direction, to British colonies, where they will not be subjected to greater spiritual destitution than they would have experienced in this country.

"To enable the committee to carry out this design, which has received the approbation and encouragement of the Bishop of London, a sum of 5000*l.* is required. When the benefit to those children who will immediately be withdrawn from ruin is considered, and that thus a commencement will have been made for the maintenance and training of all poor orphans, and their ultimate settlement in the world, the committee doubt not that those whom God has blessed with means will not hesitate to devote a portion thereof for the education of the orphans of the poor of Christ's flock."

CHEESE MAKING IN LEICESTERSHIRE.

IT is the usual practice of this neighbourhood to retain a certain portion of the farm, and generally some of the oldest turf lying contiguous to the house and farm buildings, for the use of dairy cows; and this plan is maintained, not only month after month, but year after year; and so strong is the prejudice in favour of age in the turf, that many farmers would by no means turn their cows upon seeds. They would say, by so doing they should certainly spoil their cheese. Others, also, are equally averse to manuring or liming their dairy pastures, asserting that such management would have a prejudicial effect; that the quality would be deteriorated, or the cheese would not stand. Now I cannot tell from my own experience whether there are substantial grounds for such opinions; but it must be obvious to all thinking persons, that if these opinions or prejudices are carried out, the dairy pastures must decrease in quality, till finally they will produce no cheese at all. Such has been found to be the case in Cheshire; and bones I believe have been applied with good effect as restorative of the cheese-making properties of the soil. I am fully aware it will be asserted that practice does not bear out this theory here, and that there are Leicestershire dairy pastures which have been grazed upon for many years, which are rather improved than injured in that time. I trust, if any gentleman should support such assertion, that he will also tell us as near as he can how many acres of meadow ground were robbed of their hay by his cows whilst they were daily turned out in the winter season, or how many tons of Turnips were consumed by his sheep stock upon the sound dairy pastures, when such could not be eaten upon the dirty ploughed land.

It is a matter of great consideration to all who make cheese-making a point of profit, that they secure to the land the due constituents of milk. A cow producing 4 cwt. of cheese in the season will remove from the land annually inorganic matter to the weight of upwards of 19 lbs., as phosphate of lime, magnesia, iron, &c.; which can only be restored to it by extraneous aid. Soils rich in the before-mentioned ingredients may long withstand this slow exhaustion of their inorganic riches, but the constant withdrawal of these must eventually be found, and the milk will be wanting in its true constituents. Besides this exhaustion of the inorganic particles of the soil, a cow making 4 cwt. of cheese will, through the medium of the soil and vegetable, bear from the field to the dairy 240 lbs. weight of carbonised and nitrogenised matter. Now I cannot say that Nature in her abundant resources will not supply this demand; but as far as practice is concerned, I must bear testimony to the fact that land manured and irrigated will bear the most Grass, and cows fed on Grass so produced will give a richer milk and yield a greater quantity of cheese.

I am willing to acknowledge that there may be apparent grounds for the assertion, "that cheese cannot be made well from seeds or manured land;" for in the autumn, when the Grass of the pastures is richer than in spring or summer, we have on this farm experienced a difficulty in making the cheeses keep their shape, and maintain the compact appearance which (with the same care bestowed upon them) they will ordinarily assume. I believe it to be very possible that persons have experienced some inconvenience in manufacturing a cheese when their cows have gone upon seeds, or into a lately manured pasture; and not having patience and perseverance enough to try other plans, they have at once pronounced the pasturage to be the cause of an evil which they have chosen rather to avoid than to overcome. We meet with such cases occasionally in cheese-making, and unless patience and perseverance are had recourse to, and trials are made to obviate the difficulty, the Grass, seeds, Turnips, producing such cheeses, must be summarily and lastingly condemned. I believe that by taking away a little of the cream, or by putting the milk together at higher temperature, these cheeses might be made to stand. I must here express my conviction, from five years' experience, that seeds or manured turf are not decidedly prejudicial to the cheese; and my belief that without manuring and attention the land will deteriorate, and finally become comparatively useless for dairy purposes.

This perhaps may be a suitable place to observe, that land of second-rate quality for the feeding of cattle may not be unprofitably managed by adopting the production of cheese as the mode of employment. This farm does not feed cattle well, beasts taking a considerable time and never becoming thoroughly fat upon it, without the assistance of corn or oilcake. It also yields butter indifferently, which might be expected from the fact that its Grass feeds stock slowly. The first year we attempted cheese-making we set up the Sunday's milk for butter, and the calculation I then made as to the proceeds of this milk gave this result—whilst the cows were making 7*l.* value in butter, the same made 13*l.* value in cheese.

I will now notice briefly the different varieties of stock employed in the conversion of vegetable matter into cheese. And although I admire the large size, symmetrical form, the silky hair, the early maturity, and the exterior beauty of the Durhams, I must admit that as far as my inquiry goes, the old long-horned breed are at present the best adapted for cheese-making purposes. Whenever I have heard of great quantities of cheese per head being made, it has always been (or with a single exception) from a dairy of long-horned beasts.

It must have been apparent to every one who has had the care of stock under his hands, that some individuals will bear greater hardships than others, and that such will hold their flesh, or rather increase in weight, whilst the same quantity of food given to an adjoining animal will gradually make her poor. I have noticed this particularly with some half-bred Herefords; let circumstances be what they might, these were always in the best plight in the herd. Now, I have had little to do with long-horns myself; but if the assertions of some of my friends are correct, the old long-horned breed of cattle must be the most economical for a dairy farmer's purpose, as they will bear more hardships, and consume less food while dry and in an unprofitable state,—as well as when milking, they will produce most of that liquid from which our cheese is to be made.

I find that the long-horned cows are not estimated so highly for milkers in other parts of the kingdom as they are in Leicestershire and Warwickshire; and that in distant places the Herefords, a race of cattle which we here regard as very indifferent milkers, are for the property of milking preferred before them. I think these observations will somewhat bear me out in a suggestion I am about to make—that the milk-producing qualifications of the Warwickshire and Leicestershire long-horns may not be more inherent in this than in other breeds of cattle, but may be the result of cultivation, and long continued care. I think I may be fully justified in venturing such an opinion, for a glance round this neighbourhood will show that dairies of long-horns are chiefly, if not entirely, in the possession of farmers who have for many years cultivated and maintained these breeds, chiefly in reference to their milking qualifications. I dwell rather strongly upon this point; for if years of care and cultivation have made the long-horns as a race the greatest milk-producers, we have then the course pointed out for us to follow by which we may hope to succeed in making the short-horns a cheese-producing breed.

It may be expected, perhaps, that I should draw a comparison between the actual weight produced by the long-horned and Durham, or short-horned, dairies. I have heard of 5½ cwt. off a cow being made from long-horns; I have heard, too, of 5 cwt. from short-horns; but I think it would be unfair to compare the distinct breeds in reference to their cheese-making properties, unless there was, also, a fair comparison of their food. I believe that in either case, such produce was in great measure the effect of management, and was not entirely to be attributed to peculiarity of breed.

A gentleman lately told me, in answer to my inquiries, that his cows fed their calves first, and then made 5 cwt. of cheese during the season! And the best of this was, that these cows (and long-horns they were) ate nothing but a little Grass in the summer, and Barley straw in the winter! Seeing, some time afterwards, a long-horned dairy not far from this gentleman's house, I inquired if they made much cheese. Not above 3 cwt. was the reply. I mentioned my surprise, for Mr. So-and-so made 2 cwt. more. I then was informed that his cows ate what they liked?

It is with a dairy as with feeding: cows, to produce, must first consume. When a breeder says of his pet beast "he has had nothing to eat," and, on being gently pressed on that point, "only a little cake or corn, or a few Turnips"; in short, whatever he would eat: so these cows, though they may be hereditary milkers, without constant attention to their comfort—without abundance and variety of food—would not be annual producers of 5 cwt. of cheese. The dairyman's object in forcing the yield of milk to the greatest possible extent should be circumscribed only by calculations—by this question, "Will it pay?" And there are certain times, as at this moment, when the cold weather is keeping back the Grass, in which he must not be too particular on this point, but must maintain their milk by artificial food, till the fields are ready to receive the cows, though it be at considerable cost, and at a rate which will not pay.

SHED.—We will now take some notice of the management of the cow-shed—a subject of great importance to the dairy farmer; for in this place, according to the opinions of some authorities, the cows should pretty constantly be kept, and there receive their supply of water and food. It is said that, by a due attention to warmth, provision of food, &c., there is no reason why the cheese-making process should not go on through the whole of the winter; and there is, in fact, no really preventing cause why such might not be the case. To meet, then, a winter supply of milk, large quantities of hay must be provided, and extraneous aids—such as corn, grain, and oil-cake—must be bought, which will (as far as my experience has hitherto informed me), considerably reduce the profit upon winter cheese-making. Whilst I admit the possibility of making cheese throughout the winter (and we have done so here), I still am doubtful whether it is a proper plan to be followed as a pounds, shillings, and pence speculation. I believe it to be more profitable to consume what would be saved for hay for the winter feeding in an early stage of growth, as the same quantity of ground will yield more milk when its produce is consumed as Grass than after it is dried up and made into hay.

There is also another point to be considered in connexion with the question of the winter dairy system. Cows must be allowed to go dry two months at least before calving; and this rest may as well be given during the shortest days and coldest weather—and they may, as a matter of convenience, be made to have this rest at the same time. I will not, for various reasons, advocate the uninterrupted making of cheese upon a farm, but will rather confine my observations to the best methods of managing the cows for the period of nine or ten months in which they are useful for dairy purposes.

We will take the beginning of March for the time of commencing our notice of the management of the cow-shed, and will suppose that there is laid up a store of Swede Turnips (or Mangold Wurzel, as some will say; but I do not, from my experience, speak in praise of this root), sufficient for the herd till the middle of May, also of hay, enough to give a little every day to each cow after calving till Grass; and an abundant supply of straw, which straw is to be picked over by the cattle, allowing them to make plenty of waste for their litter.

The cows at this time should be found in good condition, full of flesh, and healthy in their skins—the forwardest of them having calves. The calf, if we consider the profit of the cheese, according to my judgment, should be immediately taken away from its mother, and the cow kept warm and abundantly supplied

with food. I must here notice, that warmth has a very great influence upon the secretion of milk; and even a walk out of the shed for the purpose of drinking tends very materially to lessen the quantity given by a cow in the cold season of the year. Every cow-shed, for milking beasts especially, should have a supply of water, so that the animals may help themselves without exposure to the influences of wet weather or a lower temperature. This is no fancied or theoretical view, but is actually the fact; and that a great decrease in the quantity of milk delivered in our dairy was traced to this simple cause. Some one, for mischief, had sent down the main water pipe that supplied the shed a small bundle of straw, which lodged in one of the branches, and completely cut off the flow on that side. Sixteen cows were then in milk, and half (in consequence of the water being cut off from them), were turned out twice a day to the pit, not 100 yards off, to drink, and were immediately brought back again. A complaint was made to the man in charge of the cows that the milk was falling off considerably in quantity—and, further inquiry being instituted, it was ascertained from the milker that the loss lay upon the eight cows turned out to water, for every one had abated in her milk. This accident was at the time very satisfactory to myself, as it proved that an outlay which had been made upon theoretic views was really useful, and had not in practice been thrown away. To make you fully assured that the abatement in the milk of the eight cows was caused by their simple exposure to the unfavourable influences of a lower temperature and different atmosphere, I must tell you that with the removal of the stoppage in the pipe, and the consequent flow of water permitting the cows again to drink in the warm shed, they gradually recovered their former quantity of milk.

So much for the influence of warmth upon the secretion of milk; but a time must come when the herd must leave the shed to get the principal part of their living (for a short time at least) in the open field; and then care must be taken to prevent the changes of temperature from suddenly and unduly affecting them. Before turning them out, the doors of the shed should be partially unclosed, gradually inuring the inmates to a change. The first time for the herds going abroad should be chosen when the wind is still and the sun is shining; they must not remain out too long at a time, nor must they be exposed during the night until the temperature of the atmosphere is considerably and permanently raised.

But although I admit there is generally a necessity for turning out the dairy beasts for a few weeks in the spring—that is, until a growth of Clover or Grass rises to the scythe—I must, both upon principle and experience, recommend the soiling of cows throughout the summer season as a matter of economy, and thence as a point of profit. It would be difficult to obtain the relative produce from land grazed by the cattle themselves, and from other land mown daily, and its Grass brought home. But any one who has fed off a quantity of seeds or Grass in this way, will be surprised that a given quantity of land has kept a given quantity of stock so long; and it must be remembered that land well attended to furnish two, three, or four crops in one year. I shall perhaps be told that this mode creates expense and increases trouble—which I at once admit; but I think if any one will try the method upon my recommendation, he will tell me hereafter that he is well paid for his extra labour by the quantity of extra keeping which he thus obtained from his land. Some people will say that exercise is necessary to the cow for milking. We allow ours to walk out in the cool of the morning, and during night in the heat of the summer; but such exercise as that given to a herd by the attack of the gad-fly I thoroughly object to, and do my utmost to prevent.

In forward seasons we may begin to mow seeds about the third week in May. Rye will furnish a little keep before; but it generally runs so rapidly, that this food is of little more value than a few days. After seeds, Grass comes in—then Vetches, a second crop of seeds; and about the end of August, with management, we have plenty of Turnips, Cabbages, and spring-sown Vetches, to mix and alternate with some later saved Grass. Get once over May, we generally find little trouble in obtaining an abundant and regular supply of food. Towards the end of the year, if the weather is favourable, and the cows are housed at night, I should not recommend that the beasts should be tied up entirely; but that they be turned out in the middle of the day. When the cold season sets in, or heavy rains make the land tender, the cows are better confined wholly to their winter quarters. There is then less waste in flesh, milk, and manure; and, with warmth, a smaller quantity of food is consumed.

But if cattle are to receive the principal part of their food in sheds, very great attention must be given to them. They must have change and variety in their food, and they must be regularly served with it. A man in my employ, who attended to a lot of 33 milking beasts, went to the funeral of one of his relations; I left home the same day on business, giving these cows in charge to a young man who lived with me at that time, under his promise that they should have plenty to eat. I believe he was afraid of the rain, which fell on that day, and therefore neglected his charge; for on my return at night I heard the cows in the shed calling loudly for something to eat. The next morning there was a falling off of milk to the extent of 9 gallons; at night 11; and the following morning 13. This was late in the year; but the cows, for that season, never recovered the quantity of milk which they had previously given.

I have mentioned this fact to show how very dependent the secretion of milk is upon the supply of food, and how much the success of dairy operations depends upon the attention bestowed upon the animals which are to produce the milk. Kindness, gentleness, and quietness are requisites with cleanliness, in all engaged in a cow-shed; and all bad tempers, quarrelsome dispositions, and noisy boisterous persons, should never be allowed to set their foot therein!

Ere we leave the shed for the dairy, I have a few words to say upon the time of milking. The usual method pursued in this county is to milk twice a day—morning and evening. In Lincolnshire they will milk thrice; and in Scotland sometimes five times in the day. Last season I adopted the plan of milking thrice in one shed only; this season we are milking three times at both; you will therefore infer that I have proved it to answer. I will also tell you that, in May last, I mentioned this plan to a gentleman who supplies his milk to Leicester; he tried it upon a lot of 29 cows, and he told me that on the third day from the commencement of his trial, these cows gave him in the day 15 gallons more milk. I met this gentleman on Saturday last, and he said he should adopt this plan again. In addition to his former opinion of its utility, he gave me this further information:—that his cows had formerly been greatly troubled with sore bags, but after the thrice-a-day milking commenced, he had no more of them. We have all seen the udders of the cows greatly distended with milk, and it is no wonder that the animal feels pain, and that local inflammation ensues.

Objections may be raised to this third milking—some will say the cows require more keep. I answer the cows are machines to convert Grass into cheese, and if I can make each cow do more work I save the outlay of capital in purchasing an unnecessary number of beasts. Some will say it must be injurious to the animal. The lot milked last year thrice-a-day on this farm are equal in health and condition to the lot milked twice, and are now open to inspection.

Before I quite close this portion of my subject, I must observe that milking qualifications in an animal are equally capable of transmission by descent, with the distinctive marks of the various breeds, or with their propensities to fatten;—and if they are capable of transmission, they are also equally capable of improvement by cultivation. It behoves, then, the farmer who rears the supply of cows for his own dairy, to be particular in looking for a good line of descent in the milking qualifications of all animals introduced into his herd. It behoves him to see that these qualifications are maintained in full power to each individual, and that they be further improved in his hands by stimulating foods and regularity of milking—by kindness, warmth, and general attention to their health and habits. In short, a dairy farmer should not only care for his herd, that they give milk at the present moment in the greatest abundance, but that they have their milking powers kept to the utmost stretch as the means of producing fine milkers in generations yet to come. Perhaps I ought not to omit some practical notice of the secretion of milk. It may be styled a sympathetic operation, and the supply, in a great measure, will be regulated by the demand. This is an all-wise provision of nature for the necessities of the young of animals; and we only follow the teaching of nature a little more closely by milking oftener than twice a day. To use the words of our man who looks after a part of the cows, "the milk does not flow to the hands (that is, the udder is not so distended) now as it was in twice a day milking; nevertheless, after milking a minute the supply will come." To illustrate more particularly the sympathetic affection between the action of milking and the consequent flow of milk, I quote this man a little further. He was speaking of a particular cow, and said she had no milk in her bag when he commenced milking; but it came by milking a short time, and in such quantity, that he has often wondered where she had previously put it. This man is not a physiologist or theorist; he spoke only matter of fact.

I am well aware that the efforts of many years may in a single season be cast away by some of the diseases lately introduced into this county; almost all of us, more or less, have suffered by them. Four years ago I lost upwards of 30 calves from the mouth-disease; and since then some of my neighbours have had half their dairy cows carried off by pleuro-pneumonia. It is to be hoped that these pestilences will, in the process of time, become less virulent, or that science may afford them more decided relief. I believe it to be right in all of us to make known, for the benefit of the public, any good thing we may have discovered, even though it should expose us to the criticisms of our friends. I shall therefore tell you that one evil constantly hanging over dairy farms—and a great one it has often proved to be, viz., abortion in the dairy cows—has been successfully treated and prevented in the only three cases which have come under my inspection this season, by administering the specifics and doses of homœopathy. This science is as yet but little known among us; it has been laughed at, and I have joined in the laugh; but I do so no longer. A trial of some months has convinced me of its efficacy, as applied to animals, and I shall be happy to afford such information as my limited knowledge permits me to give, to any one who may wish to inquire into the subject. We will now leave the shed for

The Dairy.—I will not attempt a minute and chemical account of the process by which the milk we delivered from the cow-shed is here to be converted into cheese, but will content myself with practical observations on the management of the dairy. The object of all is to produce the greatest money profit; and, according to my ideas, this is best achieved by making the best quality of cheese. At Leicester fair, last autumn, there was a difference in the value of dairies to the amount of 18*s.* per cwt., which, at 3 cwt. per cow, will give 2*l.* 14*s.* per cow, or 54*l.* in a dairy of 20 cows. Now when it is considered that a little extra care and attention form perhaps the chief item in the higher prices, it is surely worthy of consideration whether we can in any way amend our plans. There is also another point upon which I would suggest a question—Can we by thought and contrivance lessen the labour of cheese-making operations? I lived formerly in a county where butter alone was made. I had occasionally seen the cheese-pan at work on my visits from home, with all its attendant discomforts to the families in which it was employed; and in comparison with the easier labours of butter gathering, I then certainly should not have been by choice an amateur producer of cheese. But a change in locality requires a change in management, and five years ago I was induced to contemplate cheese-making as the most profitable means of working this farm. As improvements had been carried out in other departments of agriculture, as well as in all the various trades and sciences of this country, I thought the art of cheese-making might be susceptible of improvement too. I was much indebted to several of our friends for the information their practical knowledge enabled them to give me, but I determined, if possible, to do with less labour in the manual part of cheese-making. I tried several schemes, some rather expensive—some of them failures; while some were attended with success.

The object I had in view was to secure the whole of the curds, and also of the butter in the cheese. To effect this, it is necessary to avoid breaking the curd by the hand, either in the cheese-pan or the vat; for by much breaking and crushing, a large quantity of minute particles of curd and butter are separated from the mass, and are carried off by the whey, to the loss both in weight and quality of the cheese.

To remove the whey from the curd with the least disturbance, we introduced the use of the syphon—and to save ladling out the remainder of the whey and curd from the cheese pan into the vat, we adopted the plan of swinging the pans on pivots fixed to their centres. The cheese-vat is merely placed upon a lead, the pan is turned upon its pivots, and its contents are delivered at once into the vat, whilst the whey which had not been entirely removed by the syphon escapes into the vessel, where it is to be skimmed for the butter it contains. On reference to our last year's account, I find 10 ounces per cow was the weekly average of the butter removed by this method from the cheese.

I will not unnecessarily occupy your time by a description of the mechanical means we have adopted, for I invited you to Bagworth Park that you might give them a personal inspection. I will now notice a few points that have become known to us in our experiments in cheese-making, after which, and the discussion which I hope will follow, I shall have pleasure in showing you the dairy, where the arrangements in use may speak for themselves.

One of the greatest desiderata now is a means of testing properly and accurately the strength of the rennet. So far as my knowledge extends, this can only be arrived at by actual trial. The common method is to make a large quantity; and by ascertaining the actual strength upon a cheese, there is some little guide obtained for future operations, so long, at all events, as the manufacture of rennet will last. But it is of very great importance that a better guide for the dairymaid's use should be laid down; for all excess of rennet, after the production of curd—that is, all that is not required to convert the milk into curd—will remain in the cheese to promote early decomposition, and is often the cause of great pecuniary loss.

The process of cheese-making depends upon chemical causes and influences, which in themselves are as unvarying as other natural laws. To procure the conversion of milk into curd, a certain degree of temperature must be obtained; and we have observed that 82-84° (about 12° lower than when it comes from the cow) is the proper heat to be observed in the summer season for putting the milk together, and about 2° higher in cold weather, to allow for the greater decrease of heat by surfaces coming into contact with a cooler atmosphere. A thermometer is now a necessary appendage to the cheese-pan. I may as well add in this place that 52½° is the proper temperature for conversion of milk into butter, and that two or three days' churning of cream (which we sometimes hear of) in winter before butter is collected, is solely to be attributed to its low temperature.

But although 82° to 84° is the proper heat for putting the cheese together—producing, according to present experience, the greatest quantity of curd—still it is not then sufficiently high in temperature to allow its complete separation from the whey. To facilitate this separation, it is found desirable to run off a portion of the whey, which must then be made hot enough to raise the whole mass in the cheese-pan to 90°. This in a few minutes will cause the curd to fall; and the whey must then be drawn off as quickly as possible, for, if allowed to remain too long, it has a tendency to toughen

the curd. Our practice is then to put the milk together at 82° to 86°, according to the weather. We let it stand an hour and a half before breaking in the pan; this is half an hour longer than generally allowed; but as we wish to use the smallest quantity of rennet in converting the milk into curd, we find it necessary to give a longer time than ordinarily is allowed for its full conversion. After breaking and settling a few minutes, we apply a syphon to run off the whey, and for this reason—it disturbs and breaks the curd far less than is done by ladling. From putting the cheese and rennet together, till the curd is removed from the pan to the vat, the time occupied is about 2½ hours.

I have seen both in Gloucestershire and Leicestershire a mill employed in grinding up the curd, and I notice often in our neighbourhood, also, that several break up by hand, to what I consider the injury of the cheese. I see likewise round us two, three, or four persons about a cheese-vat, crushing with their hands; and I have been told that it is generally thought right to continue such process for an hour at least, before the cheese goes to press. Now we dispense with a great deal of this (to us) unnecessary attention. The curd goes from our cheese-pan directly under the press without any hand-crushing whatever. There it remains 10 or 15 minutes; the edges of the curd are then pared off, and put into the middle of the cheese, which is pierced with a skewer on both sides, and returned to the press. In a quarter of an hour it is pierced again—the edges are cut off on the opposite side—and again it is put under press. In half an hour the cheese is pierced the third time—put into a dry cloth—and the press is now allowed to complete the work. I should explain that the press used in this process is a lever press, working up to 23 cwt., and that the weight brought to bear upon it at first is small, but is increased as the cheese advances in solidity. From the delivery of the curd into the vat, till it is fixed for final pressure in the press, about two hours are taken up; but for full half that time the person employed in attending upon the making may be occupied in the other work belonging to the dairy. And it must be borne in mind, that with the separation of the liquid from the solid matter, our trouble with regard to the former is ended, as there needs no carrying to the whey lead for skimming, and no further carriage from thence to the cistern. You will observe, in the dairy, the whey goes at once into the leads, and from them is removed by taking up a plug, which allows its escape to the cistern. I need not go into the minute details of brining, salting, &c., as everyone conversant with cheese-making must be well acquainted with them; but I will observe that many points which appear to be of little consequence to a casual observer will make a great difference to the economy or the profit of cheese-making.

It is the object of all of us—at least, it ought to be so—to make a good quality of cheese; and this is undoubtedly best achieved by making up at each meal immediately; every gallon of milk so converted will produce at the lowest 16 ounces of curd; and there must be some mismanagement if it ever falls below that quantity. At the autumnal season the relative value of the milk for cheese-making is greatly increased, and will sometimes yield one-eighth more of curd to the gallon. With the above object (quality of cheese) we often combine also those of size and family convenience; and for that purpose milk will sometimes be kept till the next meal. In warm weather this keeping of milk is attended with some care, for unless the temperature is brought below 56°, milk will acquire an acidity, and the result will be a sour-milk cheese. This cheese will be of less value per pound, but this will not be the whole of the loss; for experience has told us that the same measure of milk which has yielded 56 lbs. of curd in a sweet state, has, by a slight change, yielded only 45 lbs. To keep milk sweet over the meal it is necessary to cool it by water; 52½° is the temperature of water, which, being brought in contact with the vessel containing milk, and occasionally changed, will secure the milk from going sour. We have accomplished this object in our dairy by passing through it a running stream. By setting tins of milk in a trough through which this stream passes, we can keep the whole of the Sunday's milk sweet for Monday's use. There is also another advantage derived from this plan—by cooling the milk in deep tins, and occasionally stirring it, the cream is prevented from rising to the surface, and does not require the trouble of skimming and remixing with the milk, which reunion by artificial means is never thoroughly accomplished.

Among other discoveries from my various trials, I have found that tin vessels will not answer for cheese-pans. I thought to save expense by using such, but, after the first season, was obliged to lay them aside, for the chemical affinity between tin and curd is so great that we could not separate it wholly by the breaker, and slip-curd consequently was found in almost every cheese.

I will close my remarks upon the dairy in Professor Way's word's: "Scrupulous attention to cleanliness is another essential of dairy management—the scalding, cleansing, and airing of the dairy-vessels being of the greatest importance. No stable and drain should be near it, and the cheese itself, where possible, should be separated from it."

CHEESE-ROOM.—A few remarks upon the cheese-room ere I close my subject. Too often this is inconveniently situated under the slates of the house. In the summer it is too hot; in the winter it is too cold. The great heat of summer may be lessened by hanging up wet blankets at the window; and I have just heard that by allowing a few worsted threads to drop from these into a bucket of water, the blankets will be kept wet by the force of capillary attraction. In the winter the external air must be excluded as much as possible, and artificial heating by steam or other means must be employed. I recommend, where it can be conveniently done, that hot water should be used—the heat is more generally diffused, and the air is not rendered so dry as to crack the cheese.

With the utmost care employed, some of the cheeses will be found to crack. These should be filled up, and a little paper pasted over to prevent the attack of flies. I can only recommend as general rules—that you should allow no extremes of heat or cold, moisture or drought, to affect the cheeses whilst in your possession, and exchange them for money as soon as you can effect a sale. *Mr. Harrison at a Meeting of the Sparkenhoe Farmers' Club. Abridged from the Leicestershire Mercury.*

Home Correspondence.

Mr. Wilkins v. *Box-feeding.*—Perceiving in your *Gazette*, of June 15, that the Rev. George Wilkins ("P.S. of Wix, six miles from Manningtree Station") has emerged from his dignified silence, on finding for some months past that you preferred to devote your columns to more practically useful purposes than agricultural objurgations persisted in against facts which had been adduced to show the error of the Rev. Mr. Wilkins's sentiments—perceiving that the rev. gentleman has again appeared in print, treating in no very friendly way his "friend" Mr. Mechi, whose endeavours at improvement through the best road—that of practice, are at least to be praised for his benevolent desire to acquire and impart useful agricultural knowledge by experiments for the benefit of others, I shall venture to break a spear with the Rev. Mr. Wilkins as to his assertion that his esteemed "friend" Mr. Mechi's (cattle) boxes, No. 2, were made *secundem artem* 3, 4, or 5 feet in the ground. If the rev. gentleman's measurements (apparently dubious enough by his own wording) were not mere guess work, then it follows that they were not made *secundem artem*, nor in the manner recommended and practised by Mr. Warnes and others who have usefully, as regards the health of the animals, and beneficially in point of profit, compared the fattening of cattle in boxes with the old system of fattening stock in open yards, with open hovels annexed to them, whether chained up or running loose, the box-fed animals becoming much sooner ripe for the butcher, without injury to health or subjecting them "to filth and fœtid air," as described by the objector as the result of his inspection at Tiptree-hall, where, if his account be correct, I take upon myself (as an extensive feeder of cattle in boxes for some years) to say that Mr. Mechi must have fallen into error, inasmuch as Mr. Warnes has never, that I am aware of, used or recommended cattle boxes to be formed in such a manner or to a depth which Mr. Wilkins has denominated *secundem artem*, as exhibited at Tiptree Hall, viz., 3, 4, or 5 feet deep. Further, I deny that Mr. Warnes has objected to a reasonable admission of light or fresh air. So far otherwise that by his approval my ranges of boxes are open, with power to shut if necessary, about a foot the whole length of the frontage; thick glass panes are, at certain distances, let into the tiling, and there are windows to open at pleasure on the contrary side of the range, to obtain a moderate current of air in hot weather, and the excavations have been constructed with brick sides and chalk bottoms, 2½ feet only in depth, according to Mr. Warnes' system and judicious recommendation, with a moveable wooden inclined plane for beasts to enter; and whether Mr. Mechi be right or wrong in adopting Mr. Huxtable's practice of manure receptacles beneath the wooden frameworks, must depend, it is reasonable to presume, on the correctness of his application of Mr. Huxtable's plan, which it is to be hoped may be more correct than his adaptation of Mr. Warnes' system, *i. e.*, supposing his friend the Rev. Mr. George Wilkins' statement to be more entitled to attention than his unfounded abuse of what he permits himself to term "muck making in muck," "dungeons, living cattle graves, amidst darkness, filth, and noxious vapours," &c., epithets wholly unjustified by facts; for wherever the boxes are properly constructed, ventilated, and sufficient light admitted, and proper but not wasteful attention paid to the supplies of litter, no noxious vapours whatever arise, but quite the contrary, for by the frequent treading of the animals, and thorough protection from rain, the bed beneath the litter at night becomes so firm, that when a box requires to be cleared out (generally when the beast is sold), the use of the pickaxe as well as the spade is requisite, and previous to which there is no perceptible escape of ammonia whatever; and among hundreds of all classes who have inspected my boxes, the universal remark has been, and in many instances surprise expressed at the absence of all unpleasant effluvia. The Rev. Mr. George Wilkins appears to consider that, like a second Hercules, he has destroyed the Hydra; but if he will trot (if he be a horseman), or steam by rail into Norfolk, I have good information, leading me implicitly to believe that he will find the imaginary defunct hydra lively and raising many heads; in other words, the box-feeding system much on the increase in that county, whence the practice emanated, through the intelligence and praiseworthy zeal of Mr. Warnes, to whom, in these days of miscalled free-trade, by his advocacy of box-feeding and culture of Flax upon the Belgian improved principle, the agriculturists of this country, who have taken the trouble to comprehend it, have good cause to consider themselves greatly indebted; and the more so, inasmuch as Flax culture judiciously adopted finds much extra work for labourers of all ages above childhood, and especially in the winter months, when so many industrious persons through the effect of mistaken legislation, proportionally beneficial to foreign industry, as subversive of the just reward of British labour, are thrown out of employment, and have no resource but the poor-house for themselves and their families. As I have no taste for publicity, I prefer to place my name and address in the hands of the editor; and so, taking my leave of Mr. Mechi's friend, I sign myself *Verax.*

The Scotch Law of Hypothec.—You are not quite correct in your view of the Scotch law of hypothec. You apparently assume that a sale of grain in open market by a tenant is necessarily a fair sale, which the landlord's right ought not fairly to affect. But it is plain that a sale by sample in open market may be effected by a fraudulent tenant with as great, perhaps more, secrecy than on his farm. On the other hand, the present law is in some respects beneficial to the tenant. It enables the landlord to grant the lease on a postponed rent, and leaves the tenant so much the more capital to apply to the stocking and working of his farm. It also enables the landlord, with safety to himself, to grant indulgences to an industrious tenant, in the occasional postponement of the termly rent, when adverse circumstances require it, in place of being obliged by Lord Brougham's bill rigidly to exact the rent on the term day, and sequestrate the crop in default of payment, thereby ruining the tenant's credit. It is quite a mistake to think that the law of hypothec prevents or is even any hindrance to a tenant obtaining accommodation credit at the bank. You will find on inquiry at any Scotch bank that any tenant of respectable character and credit readily obtains such accommodation. And it is notorious that the prosperity of agriculture in Scotland has been mainly imputed to the facility with which which the wisely constituted banks of that country granted advances to respectable tenants for the improvement of their farms. A repeal of the law will be found to be pregnant with great evil to the tenantry. *J. S. H.* [We submit that the so-called advantage to a tenant of a postponed rent, is in its effect injurious, inasmuch as it increases the competition for land, and thus raises rents.]

The late Mr. Smith, of Deanston.—In common with every friend to practical agriculture, and to the application of science to the management of land, particularly of strong clays, I deeply lament the loss of so eminent and intelligent a labourer in the good cause, as the late Mr. Smith, of Deanston. He had the merit of being one of the first, if not the very first, to direct the attention of the heavy-land farmer to what ought to be done beneath the surface, as well as upon it, for he was none of your skin-deep, eye-pleasing reformers; but, in matters of agriculture, a thorough radical. He went to the root of the matter, began at the beginning, and successfully demonstrated by his own experience the importance of a thorough stirring the subsoil, with a view not only to its gradual amalgamation with the surface soil, but to the more ready admission of water to the drains, and of air to the roots of the growing crops. Of the operation of the common plough, Mr. Smith appears to have entertained ideas very much resembling those so powerfully set forth by Mr. Wren Hoskyns: "The plough, and all the instruments that follow it, are only the 'animal power' substitute for that more perfect process accomplished in brief by the spade;"* or, we might add, by some other, and better mechanical means, than the old plough, of breaking without uplifting the subsoil. "This," observes Mr. H., "is what mechanical power must imitate; not the sluggish cleaving of the ploughshare, which only splits up an unbroken seam of surface, making a fulcrum of that which lies below, and thus pressing and polishing the subsoil year after year, into barren and impermeable induration which the roots of no annual can penetrate."† Such was the professed object of his subsoil plough; his spade, though somewhat [of Brobdignagian operation; and though opinions have differed, and probably will continue to differ, on the quantum of good derived from the process, surely no reasonable doubt can exist as to the superiority of a broken substratum, full of fissures, over a dense compact mass of clay, alike impervious to the action of air and water. Nearly simultaneous with his own, was the appearance of Sir Edward Stracey's subsoil plough, of Rackheath, in Norfolk. Which had the merit of priority I know not, nor is it worth entering upon here. The object was the same in each, to increase and improve the area desired to be occupied by the roots of corn, or other crops, and to facilitate the operation of the under drains. On one point advanced by the writer of the obituary in question, I must be allowed to enter my decided protest. He calls Mr. Smith the inventor and chief promoter of what he is pleased to designate, as "the modern system of thorough drainage." Now a person may be a promoter, without being an inventor of a system, and this was just Mr. Smith's case. The practice of under draining is not modern, it was known to and adopted by the farmers of Norfolk, Suffolk, and other East Anglian districts, years and years before Mr. Smith, or his father, or his grandfather saw the light. It was a matter of course on all wet lands; and he would have been reckoned a very sorry manager who neglected this, the foundation of all good husbandry.

* History of Agriculture, p. 139. † Ibid.

No merit was claimed for the practice of what appeared so obvious a branch of heavy land culture. He went on smoothly, quietly, and successfully. My father entered upon his Hinton farm (Suffolk), in 1779, and was in the habit of recording in a book the principal events of last year. That book is at this moment before me, and at the very beginning of it, appears the following passage. "It may be laid down as an invariable rule, that, as Wheat always suffers more or less from wet and cold, too much care cannot be taken to lay it on small round stetches, and to use the precaution of under-draining, water-furrowing, &c., so as to lay the land as dry as possible." This was 70 years ago, and he does not allude to it, as anything very new, or out of the common way, but of course, and one which he followed up during the whole of his long career as a farmer. *Samuel Taylor, Barnwood, Gloucester, June* 20.

The Establishment of "Penny Savings' Banks" is a favourable sign of the growth of provident habits among the labouring classes. The necessity of these institutions which bring within their reach the means of even the lowest class, must be evident to all. Hitherto the savings' bank, receiving no deposit less than 1*s.*, was of little use to the humble depositor, and hence many, for whose benefit it was intended, have been unable to avail themselves of its advantages. Now the poorest of the labouring classes have an opportunity afforded them of making some provision for their future wants, as well as their neighbours, who are somewhat better off, with the additional advantage of greater facilities for the deposit and withdrawal of their pence. The present success of these new institutions is very remarkable and encouraging. I would suggest whether "penny savings' banks" might not be beneficially established in our rural districts, for which they seem especially adapted, and be made to supply the place of the clothing club and the coal fund, where not already existing, or, what is not least important, to supersede the present public-house sick club. While on this subject, I would recommend the perusal of an excellent plain "Address to the Labouring Classes, on the Advantages of Savings' Banks and Friendly Societies," published by Lovejoy, Reading. *W. E.*

Bran as a Manure for Turnips.—I tried bran, and it failed most completely; the first year it was used in the original dryness, the second year it was steeped in water, and afterwards mixed and dried with quick-lime. In both cases the bulk of bran formed a damp mouldy consistence, in which the seed vegetated, but never pushed beyond the lump, and not one plant ever brairded. Maggots were numerous. The circumstance puzzles me very much, having read the success of bran in Mr. Blackie's Cyclopedia. *J. D.*

American Churn.—My experience differs so widely from the advertised testimonials, that I am very curious to learn what has been the case with others who have tried the American churn. My dairymaid has had a six-pound churn in use for the last month (perhaps 10 or 12 churnings) under the most favourable circumstances, at 58° or 60°. The butter has never come in less than 17 minutes, usually in about 18, and once it did not come in less than three quarters of an hour; while the advertised testimonials state a much shorter time, viz., from 12 minutes even to 4 minutes. *Experting.*

Farmers' Clubs.

STRANRAER, *May* 10: *The Feeding of Cattle.*—The CHAIRMAN said the subject which had been appointed for discussion was "The most profitable method of feeding cattle fat, more particularly in regard to hammel, box, or stall feeding." He said cattle feeding had left little return during the last two years, but this state of matters could not continue. The low price of cattle was, no doubt, caused by excessive production of Turnips—forced upon farmers by the failure of Potatoes, and induced also by the extraordinary profits of feeding for some years previous to 1847-48. The evil was increased by many farmers commencing the system of feeding without experience, and sending half-fed cattle into the market, depressing the price of all kinds of beef. Like all evils, this one will necessarily cure itself. When feeding ceases to pay, farmers will cease to feed, at least to the same extent; and accordingly on a late tour in the Lothians, Berwickshire, Stirlingshire, Ayrshire, &c., he saw more Potatoes planted this year than had probably ever before been planted in these districts, and also an extraordinary breadth of Beans.—Mr. GIBSON said his own experience was chiefly confined to stall feeding, though he kept his young cattle in hammels. He considered that less food and litter would feed cattle tied in stalls than in any other way; but young growing cattle would thrive better as he had them in hammels—that he found the best feeding in winter was a full allowance of Turnips, with 1½ lb. of Linseed, and about 3 lbs. of Bean-meal, boiled with chaff and cut straw—the cattle could be fed as cheaply and as well in summer on cut Grass in lieu of Turnips, and that the smaller cost of the Grass consumed, compared with Turnips, would allow 2 lbs. extra of Bean-meal, and in this way cattle could, in summer, be house-fed as economically and profitably as in winter. With a view to this summer feeding it was the more important to save litter in winter, by stall feeding, in place of box, or hammel-feeding. He considered there was a great economy and profit in house-feeding on cut Grass and other green food in summer, both for cattle and horses. —Mr. BOWIE, Balyett, said a great deal of Bean-meal had lately been given to feeding cattle, as he thought, unprofitably. He had given to one-half a lot of cattle, 3 lbs. of Bean-meal, and to the other half nothing but Turnips, and they all went away at the same price, and the one lot as good as the other. He thought, however, that Bean-meal given to dairy cows, mixed with their boiling, had an excellent effect in producing milk. Perhaps Bean-meal, if mixed with boiling or draff, so as to afford something for the animal to chew, might do more good to feeding cattle.—Mr. M'NEEL CAIRD, had last week paid a visit to Mr. Kennedy's farm of Myremill, in Ayrshire, where both stall-feeding and box-feeding were practised; and he learned from Mr. Kennedy that although the cattle were sooner ready for market under the box system, they consumed more food; and that he considered stall-feeding much to be preferred for the collection of the liquid and solid manure. He had been exceedingly interested by his visit to that farm, which was probably the best equipped agricultural establishment in the United Kingdom—perhaps in the world. Mr. Kennedy had two immense tanks for liquid manure, and was in the course of forming two others. The united capacity of these tanks when completed would be 200,000 gallons. He had pipes laid, by which he could convey his liquid manure and apply it without cartage, over no less than 350 acres. Mr. Kennedy thought the liquid of much greater value when kept for some months till it has undergone fermentation, than when applied in a crude state. He had it in view to dissolve his solid manure, so as to transmit it also through the pipes without cartage. With that object the great mass of his straw would be used as food instead of litter. Agitators would be kept at work in the dissolving tank by the use of a steam-engine; steam would be introduced into the tanks to regulate the temperature, and, when required, hasten fermentation; and, in short, the economy of manure was there in the course of being exemplified in the highest perfection. The buildings on Mr. Kennedy's farm were newly constructed, and all the arrangements admirable. He understood from Mr. Kennedy, as the result of his experience, that six cattle could be kept during the summer months on a single acre of Italian Rye-grass, treated with the liquid dressing, according to the new system. Mr. Kennedy was a thoroughly practical man. He had been well known in the agricultural world long before this system was introduced. He was no amateur, like Messrs. Huxtable and Mechi—not even a factor, like Mr. M'Culloch. There was little or no moss on his farm; and yet he had carried out the system of high farming on a scale which distanced all his competitors, and was still bent on carrying it out further, with unshaken reliance on the soundness of its principles. He had been supported by an intelligent and liberal landlord, who knew how to appreciate such a tenant; and his case was another and perhaps a more remarkable example than any which had yet been exhibited of how much may be done, in spite of all discouragements, by the active and intelligent co-operation of landlord and tenant.—Mr. JOHN M'CAIG, Barnultoch, approved of hammel-feeding if he had houses sufficient. He thought sheaf corn improved cattle very much; that he would approve very much of a mixture of Beans and Oats bruised—say 4 bushels of Beans and 6 bushels of Oats, which he thought better than the Beans alone; that he approved of feeding at least four times each day. —Mr. M'LEAN, considering that our object is to get cattle prepared and sent fat out to market with the least expense for food, had no doubt this could best be done by stall-feeding. He would not approve, suppose he had conveniences, of allowing his cattle to go about a court. If the cattle when put up were very wild, and not accustomed to a house, it might be different. He thought the best feeding for cattle was prepared grains along with Turnips. Bean-meal, or Bean-meal and bruised Oats, mixed with steamed straw or chaff. He never used Bean-meal, or Bean-meal and Oats, without a mixture of steamed straw or chaff. He gave 3lbs. of Bean-meal and 2lbs. of bruised Oats per day, early in the season, and at the end of the season perhaps 6 lbs. of Bean-meal and 3 lbs of bruised Oats. He thought some people fed cattle too frequently. He thought they never should have above three feeds of Turnips, and in the short days perhaps only twice Turnips, and once steamed grains. That horses agreed with frequent feeding, having a small stomach, but that cattle, having a large stomach, should have less frequent feeding, and be allowed to rest, which would assist digestion and fattening.—Mr. ANDREW MURRAY approved of Bean-meal as one of the best foods for cattle, and of stall-feeding; and that greater quantities even than those stated would be profitable—in fact that the more liberal feeding, either of the land or of the animal, there would be the better return. He mentioned that by liberal manuring 1½ acre of Grass, he had fed from it for the summer two cows and a horse, and sold besides about 15*l.* worth of Grass.—The CHAIRMAN said he was in favour of stall-feeding, because it saved litter, and enabled the farmer to keep comfortably a greater number of stock than could be kept in boxes or hammels, with the litter which most farms could afford. He thought we should follow, as far as possible, the example set at Auchness, of feeding summer and winter, and of keeping a larger quantity of stock than we had been in the habit of doing. He thought we should, in fact, go to the utmost limit that our fodder and litter would allow. He considered it a wasting of valuable material to tread good straw into a puddle, as is done in many districts, merely to make manure. If we had cut Grass and Vetches for summer, we need not have our feeding-byres standing so deserted and dismal-looking as they generally are in the summer months, but might be adding to our muck heaps, and realising a little profit, too, to make up for our small winter pay for feeding. There was no doubt that Grass would feed further by cutting than pasturing, not merely in the narrow view of loss by treading, but because, the ground being covered during the dry season, there is a damp retained in the ground, and from that and other natural causes a rank luxuriance which you will not find in pastures picked bare by cattle. He hoped one result of this evening's discussion would be the general adoption of house-feeding in summer in all cases of horses, and to some extent also of cattle, if it were only for the manufacture of better manure. He thought also it was worth considering the principle involved in what has been the experience of several intelligent farmers as to the advantage found in feeding with Oats in the straw. He did not say that plan ought to be followed, for he thinks there is a loss in it, and a want of certainty as to the quantity of rich feeding actually given to the animal. But he thought we should consider whether it would not be an advantage in giving Bean-meal or other rich food, to have it mixed with something that would induce the animal to chew, as it does the Oats in the straw. He must say that he had this season been disappointed in the effect of Bean-meal and bruised Linseed given to his feeding stock, and the discussion to-night had led him to think that the same quantity of those which he had given, merely mixed with hot water, as a roll or bannock, would have a much better effect if mixed with some coarser food, both to fill the animal's stomach and to lead it to chew and salivate. That during the last 16 years he had tried various modes of feeding. He had not found boiled food successful or profitable. He had never been so successful in feeding as with about 1 cwt. of Turnips and 4 lbs. of oilcake to each beast per day. Although the nourishing food in oilcake is as much concentrated as in Bean-meal, it required a good deal of mastication. All experience showed that Bean-meal, mixed in boiling for dairy cows, had been most beneficially applied. Probably in some mixed state for feeding cattle it would be also beneficial. He believed there was no more expensive mode of feeding than with Turnips in April and May. By that time Turnips contained little nutriment. In Norfolk they had Mangold Wurzel, which keeps fresher than Turnips to feed far on in the spring, but that crop did not seem to grow well in Scotland. He thought it would generally be found profitable to grow a few acres of coarse Potatoes, to feed in April and May, and to have cut Grass again to take their place as early in May as possible. He believed we could feed cheaper on cooked grains alone, at this season, than on preserved Turnips. He had carried his stall-feeding so far as to tie up his calves. He had done this for convenience rather than from a conviction that they would feed better than in loose sheds. But he saw the weak animals get their full shares, and as care was always taken that they were not put out till the weather was warm, and the Grass well up for a full bite, they have always done remarkably well turned out to pasture.

PENWITH, *June* 14: *Box-feeding.*—Colonel SCOBELL said he thought many people were frightened unnecessarily about the expense of feeding cattle in boxes. It did not take so much room as persons imagined. He considered it took as much room to box-feed two bullocks as to stall three. ("Oh, no; more.") The tying-up cattle required a great width of house, while box-feeding did not. Last winter he had some as large Durham cattle as ever he had in his life; and very good they were. He found that 8½ feet by 7 feet was ample room for the largest bullock. If he tied up his bullocks, a great deal of room was required to go behind and in front of them; but, in box-feeding that was not required. If a farmer had a house 11½ feet wide, it would give a sufficient passage in front of the bullocks and for the box. But, for the ordinary bullocks of the country, 7½ feet by 6 feet was ample. There was a disadvantage in having too large a box, because it gave the cattle too much room, and they did not trample down the manure alike. If a farmer would only take a moderate house and put a passage in the middle of it, he would find room enough on each side; at all events, there would be room enough on one side for a large bullock, and on the other side for a smaller one. And if they allowed 3½ or 4 feet for tying up bullocks in the ordinary way, it would not require more room for two cattle in box-feeding than for three for the stall. In building a narrow house, the scantling of the timber throughout was considerably less than for a wide one. But, if they had already a wide house, they might make a ridge down through, like a table, and have the cattle on each side.—Mr. PIDWELL said he believed, as far as concerned the retaining of ammonia by means of box-feeding, it would be merely stopped up for a time, like carbonic acid in a soda-water bottle, and when the manure was moved out, the ammonia would all escape at once, instead of having escaped gradually as from the ordinary dung piles. He believed, however, that box-feeding was a convenient plan, if, with that plan, the additional care was provided to sprinkle every morning a handful of sulphate of lime over the manure, in order to fix the ammonia.—Mr. CLEVERDON said, where Turnips were eaten down, there were no sheep would stand folding like the South Downs; and there was no better way of improving land than by eating down green crops in season. They might stick the South Downs, in folding, as thick as they liked; every sheep would dress 5 feet square every day, and that was the cheapest way of depositing liquid manure. There was a deal of talk about gypsum and all those theories; but they would never do. He had seen a good many theory farmers in his day; but he had never seen any one of them do any good. He had no objection to taking care of liquid manure; he knew that the liquid was the very essence of manure; but they must consider how were the buildings to be carried out. Where were the gentlemen who could knock down their old buildings and put up new, and build tanks and all those things? It can't be done. (Laughter.) And there was no occasion for it. Let them keep their manure in a proper manner; not by the side of a hill, but where no liquid could run away except it was over meadows. Mr. Scobell had been talking about box-feeding. Now, he should be sorry to say anything to offend any gentleman; but he knew it would never be carried out to any extent. He had seen box-feeding very handy by him, and he had tried it himself. He had tried every experiment that could be thought of at Trebartha; but box-feeding would never do. Mr. Scobell said a narrow house would do; but what would they do with the old houses? If people had more money than they knew what to do with, they might try it. It was said they must have 6 feet to 7½ feet; but that was not room enough. The cattle would twist round and dung into their meat; and he never saw any cattle kept in boxes which looked well. When he saw box-feeding turn out better bullocks than those which were kept tied up, well-fed, and tended, he would turn box-feeder, but not till then. But it could not be done; there was not the capital in the country to do it to any extent. He never saw any theory farmer pay 20*s.* in the pound yet. (Loud laughter.) —Col. SCOBELL thought Mr. Cleverdon was mistaken in one or two points. He (Col. Scobell) never had bullocks more comfortable than in box-feeding; and he never had a farmer come to look at them but highly approved them. He had been for 45 years fattening cattle; and he never knew cattle thrive so in his life. Last year, he (Col. Scobell) had as much aversion to the plan as Mr. Cleverdon had now. But he was determined to try it, and he ran up a cheap shed, made of the limbs of trees; it cost about 8*l.* or 10*l.* to box seven or eight bullocks. He agreed with Mr. Cleverdon that it would be impossible to do away with the old farm buildings and build new ones; but he assured Mr. Cleverdon that the old farm buildings might be altered with small expense—not like such as Mr. Cleverdon had mentioned, which would require an expense that no farmer could pay for. If Mr. Cleverdon were to try the box-feeding, he would find most striking advantages from it, both as to manure and as to fattening. He never knew such a circumstance as bullocks dirtying their manger; they were perfectly comfortable, and he never had cattle fatten in such a way as his had this last winter. He had as many as 150 bullocks at a time tied up in the old-fashioned mode of stall-feeding, and he had been all his life accustomed to that plan; but he never found bullocks so comfortable or fatten so well as those box-fed. *Abridged from the Royal Cornwall Gazette.*

Review.

Practical Horsemanship. By Harry Hieover, Author of "The Pocket and the Stud," &c. Longmans: London.

MR. HARRY HIEOVER has again presented us with a volume full of information and instruction on his favourite subject. It is marked by the same colloquial style, full of funny anecdote somewhat prosily told, which characterised the volumes preceding it. Its first sentence—"All who have ever ridden will admit that their first step towards horsemanship consisted in getting astride something or other"—at once introduces us to the humorous manner of the writer. And till the end of the work his descriptions and instructions, always accurate and trustworthy, are given after a similar, somewhat comical fashion.

Calendar of Operations.

JUNE.

DORSET FARM, *June* 24.—Turnip sowing is now far advanced, and in many cases finished, and they have been got in in very good order, so far as cleaning of the land is concerned. We have had the weather so very dry that dragging and clearing off weeds has been a very light operation; but the fly has been very busy with us, and already some fields have been sown a second time, but those which have escaped their ravages are doing well. In some cases the fly has attacked the Mangold Wurzel, a circumstance which is far from common. Haymaking now goes on very favourably, and promises to be a very fair crop. The corn crops look very healthy, and Wheat is now beginning to show the ear. Pasture has been plentiful up to this time, but if the present dry weather continues much longer it will get scarce, as many of the fields are now getting somewhat burned. I have observed in a field, part of which we dunged and part not to Turnips that the fly showed itself more vigorous in the dunged part than in the rest, and both parts had the same allowance of artificial manure, viz., 2 cwt. of superphosphate per acre. This I think tends to prove that it is not always the best method to use the dung, or at least much of it for the Turnip crop, but rather apply it to the Wheat. *G. S.*

SUSSEX FARM, *June* 24.—Our teams are still for the most part engaged ploughing, preparing, and sowing the remainder of the Turnip crop, carting hay, and skimming Hops. Men are engaged haymaking, hoeing Potatoes, Carrots, filling dung, planting Cabbages, &c. We shall commence to thin our first-sown Turnips to-morrow; the fly has been very bad here this

year, and a good many have lost all their first sowing. Rain is now very much wanted for the Turnips, Carrots, &c.; but still the dry warm weather is quite the thing for this busy time of haymaking. Seeds are for the most part cut; ours are a good crop, but the general complaint is, "Clover is thin." Some have commenced to cut meadow hay, and hitherto the cut is good; the Hop looks well, and the bines are getting very forward; Potatoes also look much more healthy than they have done for two years past. *J. B.*

Notices to Correspondents.

AMERICAN CHURN: *Mary* asks if any one will be kind enough to give his experience of the churn. Is the butter made so quickly as good as usual?

BOARDED FLOORS FOR CATTLE: *Improver.* Enquiries have been made.

GRASS SEEDS: *A Subscriber.* Where the Barley is laid you will probably lose the Grass. No cutting now would help, except the mowing of the crop entirely off. Where it is not laid, to cut the tops off would diminish its risk of falling; but at this late season it would injure the crop. On the whole, we fear you can do nothing now, and the seeds must take their chance.

LIMING: *J S H.* We do not believe that the practice of laying the lime over the seed furrow before sowing Barley and seed brings it into injurious contact with the dung of the previous year; for the common cultivation of Turnips tends to mix the manure pretty fairly with the soil.

OATS: *Lucas.* We have no hesitation in expressing our belief that 20 quarters of Oats have never been raised per Imperial acre from any field in Scotland or out of it. We have known 13 quarters, but that must be regarded as very nearly a maximum.

OYSTER-SHELLS: *A Young Farmer.* They will not rot very easily, but they will ultimately dissolve in sulphuric acid—and the result will for the most part be gypsum—obtained very expensively, however.

PHEASANTS: *R Bosworth.* Insectivorous birds that are kept in confinement, and fed principally on grain, seem to experience an intense longing for animal food, which they must gratify. Their system demands the introduction of certain elements, which they instinctively devour if offered to them in almost any shape. This has always appeared to me to be the true explanation of the frequent cases of confined pheasants eating their own eggs so ravenously. As a probable and rational remedy, let "R. Bosworth" try the supplying his golden pheasants with plenty of worms, maggots, insects, chopped beef, hard boiled egg coarsely chopped, and crushed egg-shells, in succession, and report the failure or efficacy of the diet. A natural gratification may check or forestall the indulgence of an unnatural appetite. The desire of the imprisoned pheasants for the animal food, which they would have in habitual abundance if at liberty, may be like the longing for salt and for bitters which is experienced by man, if debarred from them for any length of time *D.—R Bosworth.* Pheasants eat their eggs for the sake of the lime contained in the shell. Give them now and then a handful of pounded oyster-shells, and the evil will be stopped. *Phil.*

PROVIDENT HABITS: *C W.* The little tract on this subject, entitled "A Plain Address to the Labouring Classes, on the Advantages of Savings Banks and Friendly Societies," is published by G. Lovejoy, Reading, where you will have no difficulty in procuring copies for circulation.

SEED STEMS: *J S H.* It is best to pull up the prematurely shooting flower stems of Carrots and Mangold Wurzel. To cut them off will only *check* the formation of flowers and seed: it will not save the root.

Markets.

COVENT GARDEN, JUNE 29.

Vegetables are abundantly supplied. Strawberries and Hot-house Grapes are both plentiful, and the same may be said of Pine-apples. The supply of Peaches and Nectarines has greatly increased, and they are large and fine. Walnuts and Chestnuts are abundant; Oranges and Lemons sufficient for the demand. Young Carrots and Turnips may be had at from 3d. to 6d. a bunch. Frame Potatoes fetch from 2d. to 4d. per lb. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans, Asparagus, and Rhubarb are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Cinerarias, Lily of the Valley, Pinks, Carnations, Rhododendrons, Ranunculuses, and Roses.

HOPS.—FRIDAY, June 28.

Messrs. PATTENDEN and SMITH report that the market continues in the same state as for some time past. The bine is progressing favourably in most places; there is still a slight sprinkling of fly. Duty estimated at 175,000*l.*

SMITHFIELD, MONDAY, June 24.

We have a large supply of Beasts, and a short attendance of buyers, consequently prices are lower. A considerable number remain unsold. It is only in a few instances that 3s. 4d. is realised. There is an extraordinary supply of Sheep. Trade is very bad, especially for big fat sheep; all kinds are lower, and many remain unsold. There is rather more demand for choice Lambs, but middling ones sell low. Calves are plentiful; they are with difficulty disposed of, at rather lower rates. From Holland and Germany there are 503 Beasts, 1780 Sheep, 154 Calves, and 20 Pigs; from Spain, 400 Beasts; from Scotland, 200; from Norfolk and Suffolk, 2000; and 400 from Cambridge.

Beasts, 3832; Sheep and Lambs, 36,900; Calves, 203; Pigs, 320.

FRIDAY, June 28.

The number of Beasts fresh up to this day's market is not very large, but there being on hand a considerable proportion of last Monday's supply, the trade for them is exceedingly dull, and higher prices cannot be realised. We have a good supply of Sheep and Lambs; the demand for them has increased, and we are able to quote an advance in price. Calves are still plentiful, and sold at very low rates. From Germany and Holland there are 128 Beasts, 1490 Sheep, 287 Calves, and 20 Pigs; from Scotland, 100 Beasts; and 119 Milch Cows from the home counties.

Beasts, 959; Sheep and Lambs, 15,320; Calves, 639; Pigs, 237.

MARK LANE.

MONDAY, JUNE 24.—The supply of English Wheat to this day's market was even less than it has been of late, and brought the full prices of this day se'nnight. The majority of arrivals from abroad continue to come very much out of condition, which, with a continuance of very fine weather, and the fact of a large number of mills having ceased working, causes the demand to be exceedingly limited; nevertheless, prices may be considered nominally unaltered.—Barley, Beans, and Peas bring the extreme prices of last week.—Oats are scarce, and good conditioned qualities 6d. to 1s. per qr. dearer. —New York, 13th June, per telegraph: The market was firm for Wheat and Flour; and from Baltimore, shipments of the latter were being made to New Orleans. Indian Corn dull.

FRIDAY, JUNE 28.—The arrivals of Foreign Wheat this week have been large, but small of all other descriptions of grain. This morning's market was thinly attended, and the business transacted in Wheat, Barley, Beans, Peas, or Oats, so limited, that we observe no alteration in the value of either article. Flour continues to be a slow sale. At 26s. per quarter there is a speculative demand for Galatz Maize. The hot parching atmosphere which prevailed during the early part of the week was succeeded on Wednesday night by severe thunder storms, and the weather has since remained cool and unsettled. The supplies of English Wheat in the provincial markets have been barely adequate to the demand, and command extreme prices.

LIVERPOOL, TUESDAY, JUNE 25.—At this day's market trade was dull for Wheat of all descriptions, and holders refrained from pressing business on lower terms; we are therefore scarcely warranted in reducing our quotations below those of this day week. Barley was rather more saleable at late prices, and Malt remained steady in value. Beans, upon a moderate demand, supported previous rates. Peas, moving sparingly, were the turn cheaper. Oats, although in moderate request, declined ½*d.* per 45 lbs. Prices: Wheat, English, red, per 70 lbs., 5s. 6d. to 5s. 10d.; white, 5s. 6d. to 6s. Barley, Scotch and Irish, per 60 lbs., 2s. 9d. to 3s. Malt, English, per qr., pale, 48s. to 52s. Oats, English and Scotch, 2s. 8d. to 2s. 10d. Beans, English, per qr., 27s. to 31s. Peas, do. do., 25s. 6d. to 26s. 6d.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;
beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.
This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.
The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.
PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	..	£3 15 0
Do. of 100 yards, 24 ins. wide	..	..	5 0 0
Do. of 100 yards, 30 ins. wide	..	..	6 5 0
Do. of 100 yards, 36 ins. wide	..	..	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.
This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.
C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.
C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.
Workmen sent to all parts of Scotland, England, and Ireland.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

		Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide	...	7*d.* per yd.	5*d.* per yd.
2-inch ,, strong ,,	...	9 ,,	6½ ,,
2-inch ,, extra strong ,,	...	12 ,,	9 ,,
1⅝-inch ,, light ,,	...	8 ,,	6 ,,
1⅝-inch ,, strong ,,	...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,,	...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.
Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.
JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.
These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.
Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.
A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	¼ in.	⅜ in.	½ in.	¾ in.	1 in.	1¼ in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s.* 5*d.*	0*s.* 6*d.*	0*s.* 8*d.*	0*s* 10*d.*	1*s.* 0*d.*	1*s.* 2*d.*	1*s.* 4*d.*	1*s.* 6*d.*		
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3		
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3		

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.
All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

PALMS, &c., FROM PARA.

MR. J. C. STEVENS will sell by Auction at his Great Room, 38, King-street, Covent Garden, on THURSDAY next, 4th July, at 2 o'clock precisely, a small consignment, from Para, of Palms and other Plants and Seeds; they will be sold in collections, about eight species in each collection. May be viewed till the Sale, and Catalogues had.

WIRE FENCING, less than Two-inch mesh, made from Iron Wire, and painted, to exclude Hares and Rabbits, Cats, Dogs, Deer, Sheep, &c. &c.; 15 inches high, 3*d.* per yard; 2 feet, 4½*d.*; 3 feet, 6¾*d.*; 4 feet, 9*d.*; 6 feet, 1*s.*; or any width required, at ⅔*d.* per square foot. Well adapted for enclosing Fowls, Pheasants, &c.—ROBERT RICHARDSON, 21, Tonbridge-place, New-road, London.

FISHING NETS, SHEEP NETS, &c.—Double Walled Trammel Nets, 3*s.* per yard, 6 feet deep, 1-inch mesh. Drag Nets, various lengths, from 5 to 500 yards long each. Carp and Tench Nets, Casting Nets, Nets for Lake and Pond Fishing. Various kinds made to order. Nets to cover in Pheasantries. Sheep Nets, nearly 4 feet high, 4½*d.* per yard, will last six years.—ROBERT RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New-road, London.

TENTS FOR LAWNS, RICK CLOTHS, &c.—Tents made on the principle of a parasol; put up or taken down in five minutes; requiring no side lines; 12 feet diameter, 6 feet high in the lowest part, 5*l.* each; 10 feet diameter, 4*l.* Tents 12 feet square, 5*l.* each; 6 feet high in the lowest part, or made without a centre pole (a great advantage for convenience), 5*l.* 10*s.*, larger or smaller in proportion. Rick Cloth for 30 tons of Hay, 30 feet by 30 feet in size, 5*l.*, complete with side lines.—ROBERT RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New-road, London.—N.B. A quantity of second-hand Garden Mats, 6 feet by 4 feet, at 32*s.* per 100.

GARDEN NETS.—New Twine Net, 1-inch mesh, 1½*d.* per yard; ½-inch mesh, 2½*d.* per yard; Worsted, 1-inch mesh, 2½*d.* per yard; may be had in any width required. Old Fishing Nets tanned and mended up at the rate of ¾*d.* per yard; strong Net, to exclude wasps and flies, 6*d.* per square yard; Net for shading greenhouses, excluding wasps and flies, giving sufficient light at all times, and requiring no rollers, 6*d.* per square yard; Bunting, Screens, &c.—ROBERT RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New-road, London.

GRAY AND MITCHELL'S GENERA OF BIRDS.—Subscribers are informed that the Drawings have been rubbed off the stones, and they are requested to complete their Sets without delay. Only a few copies remain, price 26*l.* 5*s.* in Parts; and 31*l.* 10*s.* half-bound morocco, gilt tops.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

TO GENTLEMEN RETIRED FROM BUSINESS.—A family, resident in one of the leading agricultural districts of Scotland, on an estate of which 5 acres are occupied as garden and ornamental ground, and the remainder, upwards of 30 acres, in tillage, are desirous of meeting with a gentleman having a taste for gardening and agriculture, who would board with them, and take the superintendence of the garden and land. The house and grounds are delightfully situated in a warm and fertile district, and the ground is in excellent order. References will be given and required, and further particulars may be had on application by letter to A. B. C. care of James Dodds, Esq., Solicitor, 17, Fludyer-street, Westminster.

LOUDON'S HORTUS BRITANNICUS.
On Friday, July 5, will be published, a New Edition, in 8vo, price 31*s.* 6*d.* cloth,

HORTUS BRITANNICUS: a Catalogue of all the Plants indigenous to, cultivated in, or introduced into Britain. By J. C. LOUDON, F.L.S., &c. A New Edition (1850), with a Supplement, including all the Plants down to March, 1850; and a New General Index to the whole Work. Edited by Mrs. LOUDON and W. H. BAXTER, Esq.
*** The New Supplement may be had separately, price 14*s.*
A New Edition of LOUDON'S ENCYCLOPÆDIA OF GARDENING, corrected to 1850 by Mrs. LOUDON, is also in course of publication in 10 Monthly Parts, price 5*s.* each.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

THE LADIES' COMPANION, for June 29, being the First Number of Volume II., contains:—The Story of a Bouquet. By PAUL BELL.—A "Charming" Day at the Zoological Gardens.—Man and the Rose. By JULIA DAY.—Chapters on Dress: Chapter I.—Court Dresses, beautifully Illustrated.—Household Hints and Receipts. By Miss ACTON.—The Drama.—Amusements.—Parlour-Window Talk, &c. &c.
Published Weekly, price 3*d.*, stamped, 4*d.*, and in Monthly Parts. Parts I. to VI. are now ready.
Office, 11, Bouverie-street, and all Booksellers and Newsmen.

This day is published,

THE JOURNAL OF AGRICULTURE AND THE TRANSACTIONS OF THE HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.
No. XXIX. of the New Series. Price 3*s.*
Published Quarterly.
WILLIAM BLACKWOOD and SONS, Edinburgh and London.

MORE CURES of CONSUMPTION by Dr. LOCOCK'S PULMONIC WAFERS.—"Gentlemen: I can speak of your wafers myself with the greatest confidence, having recommended them in many cases of pulmonary consumption, and they have always afforded relief when everything else had failed, and the patients, having been surfeited with medicine, are delighted to meet with so efficient a remedy, having such an agreeable taste, &c. (Signed) JOHN MAWSON, Surgeon, 13, Mosley-street, Newcastle-upon-Tyne." They have a most pleasant taste. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* per box. Agents: DA SILVA and Co., 1, Bride-lane, Fleet-street, London. Sold by all medicine vendors, of whom also may be had Dr. LOCOCK'S FEMALE WAFERS, the only remedy recommended to be taken by ladies. They have a pleasant taste. Beware of counterfeits in the form of pills.

PATENT GUTTA PERCHA UNION JOINTS AND HOSE FOR FIRE ENGINES, LIQUID MANURE, AND GARDEN PURPOSES.—The Hose is manufactured of Canvas, lined and coated with Gutta Percha, and is very durable as well as elastic. The prices are as follows:—1 inch, 7*d.*; 1¼ inch, 8*d.*; 1½ inch, 9*d.*; 2 inches, 10*d.* Also cheap Canvas Hose, at 3*d.* per foot, 1 inch; other sizes in proportion. Gutta Percha Hose of all kinds supplied at very low prices by BURGESS and KEY, 97, Newgate-street, London.

SKIN DISEASES, CUTANEOUS ERUPTIONS, RINGWORM, AND SCORBUTIC HUMOURS CURED BY HOLLOWAY'S OINTMENT AND PILLS.—The virulence of these complaints is very much increased by the impurity of the blood, therefore to cleanse the same is the first step towards checking the baneful effects of these maladies on the constitution, and there is no medicine so efficient for this purpose as HOLLOWAY'S, with which should be applied his invaluable Ointment, as, when combined, there is no disease of the skin that can resist their curative powers. For the cure of old wounds, bad legs, glandular swellings, and ulcerous sores, these medicines are unequalled.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

DARLEY'S SCIENTIFIC LIBRARY

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory, and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A NEW EDITION (being the fifth) *is now ready*,

A SYSTEM OF POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

II.

NEW EDITION (just published),

COMPANION TO THE POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

III.

THIRD EDITION,

A SYSTEM OF POPULAR ALGEBRA;

WITH

A Section on PROPORTIONS and PROGRESSIONS.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than 'Darley's Popular Geometry and Algebra.'"—*Library of Useful Knowledge, article "Mechanics."*

IV.

SECOND EDITION,

A SYSTEM OF POPULAR TRIGONOMETRY,

Both Plane and Spherical.

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

BY GEORGE DARLEY, A.B.

Price 3*s.* 6*d.*, cloth.

V.

FAMILIAR ASTRONOMY.

BY GEORGE DARLEY, A.B.

WITH ENGRAVINGS.—12mo, 5*s.*, cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

NEW EDITION OF

PROF. LINDLEY'S INTRODUCTION TO BOTANY.
Recently published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24*s.* cloth,

INTRODUCTION TO BOTANY. By Professor LINDLEY, Ph.D. F.R.S. Professor of Botany in University College, London, &c. Fourth Edition, with Corrections and numerous Additions.

EXTRACT FROM PREFACE.

In this new and enlarged Edition, the Author has followed very nearly the method recommended by the celebrated Professor De Candolle, than whom no man is entitled to more deference, whether we consider the soundness of his judgment in all that relates to order and arrangement, or the great experience which a long and most successful career of public instruction has necessarily given him.

The Author has begun with what is called ORGANOGRAPHY (Book I.); or an explanation of the exact structut of plants; a branch of the subject comprehending what relates either to the various forms of tissue of which vegetables are constructed or to the external appearance their elementary organs assume in a state of combination. It is exceedingly desirable that these topics should be well understood, because they form the basis of all other parts of the science. In physiology, every function is executed through the agency of the organs: systematic arrangements depend upon characters arising out of their consideration; and descriptive Botany can have no logical precision until the principles of Organography are exactly settled. A difference of opinion exists among the most distinguished botanists, upon some points connected with this subject, so that it has been found expedient to enter occasionally into much detail, for the purpose of satisfying the student of the accuracy of the facts and reasonings upon which he is expected to rely.

To this succeeds VEGETABLE PHYSIOLOGY (Book II.); or the history of the vital phenomena that have been observed both in plants in general, and in particular species, and also in each of their organs taken separately. It is that part of the science which has the most direct bearing upon practical objects. Its laws, however, are either unintelligible, or susceptible of no exact appreciation, without a previous acquaintance with the more important details of Organography. Much of the subject is at present involved in doubt, and the accuracy of some of the conclusions of physiologists is inferred rather than demonstrated; so that it has been found essential that the grounds of the more popularly received opinions, whether admitted as true or rejected as erroneous, should be given at length.

Next follows GLOSSOLOGY (Book III.); or, as it was formerly called, TERMINOLOGY; restricted to the definition of the adjective terms, which are either used exclusively in Botany, or which are employed in that science in some particular and unusual sense. The key to this book, as also to the substantive terms explained in Organography, will be found in a copious Index at the end of the volume.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

THE VEGETABLE KINGDOM; or the Structure, Classification, and Uses of Plants; illustrated upon the Natural System. Second Edition. 500 Illustrations. Price 30*s.* in cloth.
*** To suit the convenience of Students and others, the above Work is issued also in 12 Monthly Parts, price 2*s.* 6*d.* each.
London: BRADBURY and EVANS, 11, Bouverie-street

GRAY, ORMSON, AND BROWN,

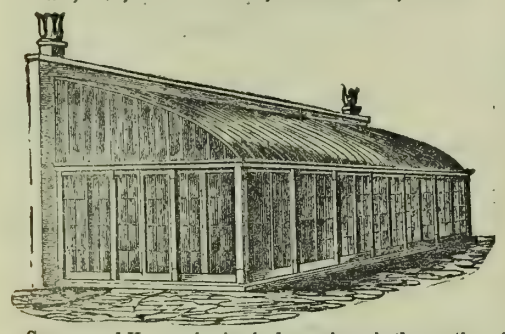
DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

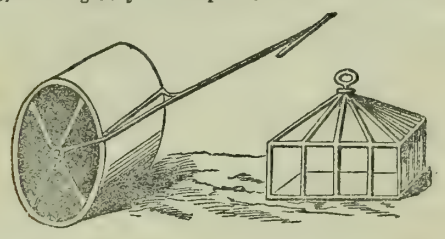
Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.



(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

TO THE LADIES THAT TAKE AN INTEREST IN THEIR FLOWER GARDENS, AND WHO DOES NOT?

D. FERGUSON, with much pleasure states he can supply them with well-rooted plants, from cold frames, of first-rate Verbenas, Calceolarias, Geraniums, Heliotropes, Fuchsias, Anagallis, Cupheas, Ageratums, Pentstemons, &c., for bedding out, at 1*s.* 6*d.* per dozen, if 5 to 20 dozen are taken; 1*s.* 3*d.* if 20 to 50; above 50, 1*d.* each; and if 100, five dozen will be added: carriage free to London, Birmingham, Leamington, Peterborough, Banbury, Bedford, and all intermediate stations on the North-Western Railway. Lists marked for selection at the above prices, sent free on application: but those not already in possession of a collection, D. F. advises parties to state the colour and quantity they want, and leave the selection to him; and to those who have no convenience for wintering plants, they will find it advantageous to give their annual orders in July or August for the following Spring, as they, on taking five dozen and upwards, will have the choice, not only of those marked in the list, but any other bedding-out plant, if possible to procure, at equally low prices.



Letters directed Buckingham, in place of Aylesbury, reach D. F. one day sooner: where all post-office orders are requested to be made payable.

COTTAM & HALLEN, ENGINEERS, IRON FOUNDERS, &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON.

COTTAM and HALLEN having had experience in the erection of HOTHOUSES and CONSERVATORIES (made of Iron or of Iron and Wood combined), and from many improvements they have made during that time, can with confidence undertake to erect such buildings with economy and dispatch.

HOT WATER APPARATUS for heating the above and other buildings (of which they have constructed upwards of 3000), fixed at greatly reduced prices.

COTTAM and HALLEN have on show, at their repository, No. 2, Winsley-street, Oxford-street, a great variety of the following articles, for GARDENS, &c., at Greatly REDUCED PRICES, viz.:

Garden Rollers,	Hand-glass Frames,
Garden Engines,	Flower Stakes,
Garden Syringes,	Flower-bordering,
Watering Pots,	Flower Stands,
Garden Vases,	Garden Arches,
Mowing Machines,	Garden Chairs.

Every description of Work, both plain and Ornamental, in wrought and cast iron, for Gardens, &c. &c.

HORTICULTURAL TOOLS and AGRICULTURAL IMPLEMENTS of all kinds.

STRONG IRON HURDLES, strained Wire Fencing, &c.

Show Rooms at the MANUFACTORY, 2, Winsley-street, and 76, Oxford-street, three doors West of the Princess's Theatre.

Just published, in post 8vo, price 9*s.* cloth,

THE COURSE OF CREATION: or, the Sequence of Geological Phenomena as illustrative of the Divine Attributes and their bearings on the Sacred Record. By JOHN ANDERSON, D.D., Minister of Newburgh, Fife, N.B.

London: LONGMAN, BROWN, GREEN, and LONGMANS.
Edinburgh: A. and C. BLACK.

Uniform with the 'Elements,' price 3*s.* 6*d.*

COOLEY'S GEOMETRICAL PROPOSITIONS DEMONSTRATED; or, a Supplement to Euclid: being a KEY to the Exercises appended to the 'Elements,' for the use of Teachers and private Students. Upwards of 120 Propositions deduced from the First Six Books of Euclid, are illustrated in it by new Diagrams.

WHITTAKER and Co., London.

THE MACCARONI FARM.—To be Let, from Michaelmas 1850, the above excellent Sheep Farm, the property of Lord De Mauley. Comprising a capacious Farm-house and premises in good repair, and in a central position; together with 502A. 1R. 11P. of Arable, and 29A. 2R. 37P. of Meadow Land, in the parish of Eastleach, within a ring-fence: also 17A. 2R. 13P. of Meadow Land, bordering the river Thames, by the town of Leachlade. A good road passes through the centre of the farm, which is distant from Leachlade 3, from Fairford 4, and from Cirencester 9 miles; the latter being a principal market town in the county of Gloucester.—For particulars as to rent, &c., apply to Mr. W. B. JOHNSON, of Pawlett, near Bridgewater, Somerset, and to view the Farm, to Mr. C. COSENS, of Hathcrop, near Fairford.

THE PRACTICAL GARDENER AND MODERN HORTICULTURIST; in one volume, 988 pages, closely printed, with upwards of 300 illustrated Woodcuts, containing the present improved scientific mode of managing the Kitchen, Fruit, and Flower Gardens, the Greenhouse, Hothouse, Conservatory, &c. By CHARLES M'INTOSH, C.M.C.H.S., of Dalkeith Palace. In cloth, lettered, price 21*s.*; and also with Specimens of choice Flowers, coloured, 26*s.*

"The labour and experience of a life devoted to the science of Horticulture."—*Vide Author's Preface.*

With an APPENDIX, describing a new and economical method of producing uniform Bottom-heat from Hot Water in Tanks, upon the most simple plan, with explanatory Diagrams, and Reference to Buildings now in successful operation; by which means, the "King of all Fruits," the Pine, and other tropical fruits and flowers, may be cultivated at less than half the expense of the old system.

London: THOMAS KELLY, Paternoster-row; SIMPKIN, MARSHALL and Co.; and sold by all booksellers.

COUNTY FIRE OFFICE, 50, Regent-street, and 2, Royal Exchange-buildings, London.—Established 1806.

It is respectfully notified to parties holding Policies in this Office, the renewals of which fall due at Midsummer, that the same should be paid on or before the 9th of July. The receipts are lying at the offices in London, and in the hands of the several Agents.

The terms of the County Fire Office are highly advantageous to the insured, and have secured to it a large share of public approbation. All claims are settled with promptitude and liberality. Full particulars will be immediately furnished to parties applying personally, or by post, to either of the above offices, or to any of the Agents who are appointed in all the principal towns of the United Kingdom.

JOHN A. BEAUMONT, Managing Director.

Consulting Actuary—Professor Hall, M.A., of King's College.
Standing Counsel—Sir John Romilly, M.P., Solicitor-General.
Solicitor—William Fisher, Esq., 19, Doughty-street.

ADVANTAGES OF ASSURING WITH THIS COMPANY.

In addition to a large subscribed capital, Policy-holders have the security of an Assurance fund of more than a quarter of a million, and an income approaching 70,000*l.* a year, arising from the issue of 6500 policies.

BONUS, OR PROFIT BRANCH.

Persons assuring on the Bonus system will be annually entitled to 80 per cent. of the profits on this branch (after payment of five yearly premiums); and the profit assigned to each Policy may be either added to the sum assured or applied in reduction of the annual premium.

NON-BONUS, OR LOW-PREMIUM BRANCH.

The Tables on the non-participating principle afford peculiar advantages to the assured, not offered by any other office,—for where the object is the least possible outlay, the payment of a certain sum is secured to the Policy-holder on the death of the assured, at a reduced rate of premium.

Premiums to Assure £100.			Whole Term.	
Age.	One Year.	Seven Years.	With Profits.	Without Profits.
20	£0 17 8	£0 19 1	£1 15 10	£1 11 10
30	1 1 8	1 2 7	2 5 5	2 0 7
40	1 5 0	1 6 9	3 0 7	2 14 10
50	1 14 1	1 19 10	4 6 8	4 0 11
60	3 2 4	3 17 0	6 12 9	6 0 10

One-half the Whole Term Premium may remain on credit for seven years, or one-third of the Premium may remain for life as a debt upon the Policy at 5 per cent., or may be paid off at any time without notice.

Claims paid in one month after proofs have been approved.

Loans upon approved security.

The Medical Officers attend every day at Throgmorton-street, at a quarter before 2 o'clock. E. BATES, Resident Director.

PELICAN LIFE INSURANCE COMPANY, established in 1797, for Granting Assurances on Lives and Survivorships.

Offices, 70, Lombard-street, City; and 57, Charing-cross, Westminster.

DIRECTORS.

W. Cotton, Esq., D.C.L., F.R.S.	Henry Lancelot Holland, Esq.
William Davis, Esq.	J. Petty Muspratt, Esq.
Richard Fuller, Esq.	C. Hampden Turner, Esq.
J. A. Gordon, Esq., M.D., F.R.S.	Matthew Whiting, Esq.

AUDITORS.

Emanuel Goodhart, Esq. John Davis, Esq.
John Haggard, Esq., D.C.L.

SECURITY.—In the policies granted by this company there is no clause limiting the liability of the shareholders to the amount of their respective shares. The assured have the guarantee of a subscribed and accumulated capital of upwards of one million sterling; in addition to which, the private fortune of every individual shareholder in the company is responsible for its engagements.

BONUS.—At the division of profits declared up to 3d July, 1847, the bonus added to policies effected in the seven preceding years on "the return system," averaged 33 per cent. on the premiums paid. Four-fifths, or 80 per cent. of the profits are divided amongst the policy-holders.

LOW RATES.—The assured on the non-participating scale are charged the lowest possible rate of premium.

ROBERT TUCKER, Secretary.

HORTICULTURAL SOCIETY OF LONDON.—HIS GRACE THE DUKE OF DEVONSHIRE, President of the Horticultural Society, has kindly directed the Grounds of Chiswick House to be opened for the reception of the visitors to the Society's Gardens at the next Exhibition, on SATURDAY, the 13th JULY. Tickets are issued to the orders of Fellows of the Society only, at this office, price *5s.*; or at the Garden, in the afternoon of the 13th July, at *7s. 6d.* each, but then also only to orders signed by Fellows of the Society. But respectable strangers, or residents in the country, who will forward their addresses in writing to the Vice-Secretary, 21, Regent-street, on or before Thursday, the 11th of July, may obtain from that office an authority to procure Tickets on this occasion. No official orders for Tickets will be issued after that day.

N.B.—No Tickets will be issued in Regent-street on the day of Exhibition.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—Under the Patronage of her Most Gracious Majesty the QUEEN. The Fourth EXHIBITION for the season will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on TUESDAY, the 23d July (open to all Exhibitors), when Prizes will be awarded for the following Productions, viz., Miscellaneous, Orchids, and Specimen Plants, Cape Heaths, Fuchsias, Carnations, Picotees, Verbenas, Roses, Cut Flowers, Fruit, and Honey. In addition to the above, the following extra prizes are offered: By J. Coppock, Esq., *5l.*, for a collection of Miscellaneous Plants; by C. Lichner, Esq., *1l.*, for Verbenas; by Messrs. J. and J. Fairbairn, *2l.*, for Cape Heaths; by W. T. Iliff, Esq., for cut Indigenous Plants; by Mr. E. Denyer, of Brixton, *1l. 10s.*, for Roses; by Mr. C. Turner, *3l.*, and by Mr. N. Norman, *1l. 10s.*, for Carnations and Picotees for class showing. List of Prizes and the Rules for Exhibition may be obtained from JOHN T. NEVILLE, Secretary.

Ebenezer House, Peckham, Surrey.

GRAND HORTICULTURAL AND FLORAL EXHIBITION. Open to all England.

The FIRST EXHIBITION of the LEEDS HORTICULTURAL and FLORAL SOCIETY will take place in the INFIRMARY GARDENS, on the 10th and 11th of July.

Upwards of 100 Guineas will be awarded in Prizes. Cottagers' Prizes, *15l.* Schedules may be had on application to J. BUCKTON and L. HICKS, Secretaries, Briggate, Leeds.

CHRYSANTHEMUMS.

ROBERT WHIBLEY offers selections from his select and extensive collection, including all the new ones of last year, at *6s.*, *9s.*, and *12s.* per dozen, fine plants.

Nursery, Kenniagton, London.

THE BLACK PRINCE STRAWBERRY.—The above Strawberry has been severely tested, and has received Two Prizes, one from the Horticultural Society, the other from the Royal Botanic. It is decidedly the best early Strawberry; an enormous bearer, many plants this year having 200 fruit upon them. The fruit is of a medium size, and when fully ripe it is a dark mulberry colour, with a rich flavour. The fruit was admired at Buckingham Palace, and plants commanded for all the Royal Gardens. Plants will be ready to send out about the 1st of September. Price, per 100, *10s.*, or 300 for *21s.*

Also will be published, at the same time, a new book, containing an Essay on the Potato sent to the Belgian Government, with entirely new plans of growing Asparagus, Seakale, and Rhubarb for the million; the Strawberry, Cucumber, Melon, Chicory (as a salad), the Lisianthus Russellianus, &c. Price *2s. 6d.*; by post, *3s.*

Post-office orders on Camberwell, directed to JAMES CUTHILL, Horticulturist, Camberwell, London.

NEW FUCHSIAS, VERBENAS, AND PETUNIAS of Spring 1850, at very reduced prices, viz.:

FUCHSIAS.—Inaccessible, Kossuth, Beauty of Stortford, Mrs. W. Taylor, Sir J. Falstaff, Distinctus, Yorkshire Eclipse, Beauty of Richmond, Story's Striata, Unique, Duplex, Multiplex, South Devon, Mirabilis, and Ignea. The above Fuchsias at *24s.* per doz., or any one variety at *3s. 6d.* each, post free.

VERBENAS.—Mrs. Mills, Desdemona, Masterpiece, Monitor, Calliope, Lura, Letitia, St. Catherine, Adonis, Gem, Rosea Alba, Rosy Morn, Village Maid, Beauty of Eye, Delicata, Magnificent, Margaret Catchpole, Sunset, Wonderful, and Magnificent (Woodcock's). French varieties: Adela, Amis, Bajeans, General Brea, Gloire de Paris, M. Lequay, Niobe, Pauline, Phaeton, and Perrier.

PETUNIAS.—Queen, Herseeana, Picta, Letitia, Youngii, North London, Exquisite, Queen of England, King of Crimsons, Attraction, Gem of the North, and Rose Superb.

The above Verbenas may be had at *12s.* per dozen, or six for *7s. 6d.*

MIMULUS.—Criterion and Elegans, *1s. 6d.* each.

All orders will be supplied in strict rotation. Apply to HENRY WALTON, Edgend Marsden, near Burnley, Lancashire.

All orders to be prepaid, and made payable at Burnley.

EDWARD DENYER, NURSERYMAN, Loughborough-road, Brixton, within three miles of London, informs his kind patrons in general that his unrivalled Collection of ROSES, reaching to nearly 1000 varieties, are now in bloom and free to the inspection of all visitors, Sundays excepted. Orders taken at this time and executed in November next. Price of Standard Roses, *15s.* to *20s.* per dozen. Fruit Trees, &c., &c.

E. D. informs his friends that he has no Seed Shop in London.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, July 6.

CARNATIONS AND PICOTEES.—Grand Trial Exhibitions for Northern *versus* Southern raised varieties. Fifty Prizes—*70l.* value.—Schedules for the above Exhibitions may be had upon application to Mr. John Keynes, Salisbury; Mr. John Holland, Middleton; Mr. W. Bragg, Star Nursery, Slough; Messrs. T. Scholefield and Son, Knowsthorpe, near Leeds; Mr. J. F. Wood, Midland Florist, Nottingham; Mr. C. Turner, Royal Nursery, Slough; Mr. T. Dobson, Worton Cottage, Isleworth; Mr. E. S. Dodwell, Derby; the Office of this Paper; and Mr. J. Edwards, Treasurer, Wace Cottage, Holloway.—The Southern Exhibition will be held at the Royal Nursery, Slough, on Thursday, July 25; the Northern in the County Hall, Derby, on Wednesday, August 7.

Subscriptions received by any of the above-named parties.—Each Exhibition is open to all England.

CARNATIONS AND PICOTEES.—By an error of the Printer (and not discovered until the Schedules had been freely distributed), the line for the division of NORTH from SOUTH is given LYME REGIS (which is in Dorsetshire), instead of LYNN REGIS, Norfolk.

Intending Exhibitors, Raisers, and the general Carnation-loving Public will please to bear in mind, that Condition 1 (see Schedule), should read, "That a line commencing at Pembroke and ending at Lynn Regis, Norfolk, be the line separating North from South." JOHN EDWARDS.

HORTICULTURAL FETE, CHISWICK, July 13.—Persons visiting those noted Gardens will find Good Accommodation at GEORGE BATTERSBY'S, "PRINCE OF WALES," Turnham Green. An Ordinary on Fête days, at 2 o'clock, at *1s. 6d.* each. N.B.—Wines and Spirits of the first quality.

Turnham Green, July 6.

G. CLARKE begs respectfully to inform ROSE Admirers that his fine Collection is in BLOOM, comprising all the new varieties. Orders taken now and executed in November. Price of Standards, *15s.* per doz., and upwards.

Fine specimens of Ericas at moderate prices.

G. CLARKE, Streatham-place Nursery, Clapham New-park, Brixton-hill, Surrey.

TO CINERARIA GROWERS AND OTHERS.

HARDY AND SON, SEED-GROWERS, Maldon, Essex, is supplying new CINERARIA SEED for present sowing from a large collection of first-rate flowers, in packets, *1s.* each. N.B. Choice Sweet William, from 70 distinct varieties approved of by Dr. Lindley. Also Superior Giant Stock, each *6d.* per packet. A plant or packet of seeds of the Heraclium Giganteum can still be supplied for *1s.*—All free by post.

TRUE DRUMHEADS FOR CATTLE, by THOS. WELLAND, at the Surrey Gardens, Wheeler-street, Godalming, Surrey. Packed to Godalming Station, *3s. 6d.* per 1000. A great variety of choice garden plants.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long, 13 feet wide, *90l*; 21 feet long, 13 feet wide, *50l.*; 12½ feet long, 10 feet wide, *30l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber boxes, Iron hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the Kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes, kept ready for use, packed, and sent to all parts of the Kingdom; warranted best material. Garden-lights of every description, at JAMES WATTS', Hothouse Builder, Claremont-place, Old Kent-road. Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

MAGNUS'S ENAMELLED SLATE is handsomer and more durable than the choicest Marbles, is less than half the cost of the commonest, and is PATRONISED by her MAJESTY and PRINCE ALBERT, the Nobility, Clergy, Architects of Eminence, Engineers, Builders, Railway Contractors, and the Public generally. It is suitable for Chimney-pieces, Pier-table tops, Vases, Ink-trays, and ornaments of various descriptions, Billiard-tables, Baths, Wash-stand, and Dressing-table Trays, Door Furniture, Candelabra, Columns, Monuments, Head Stones, Mural Tablets, Pilasters, Plinths, Fonts, Grand Staircases, Balusters, &c., and is made to represent not only the marbles in ordinary use but all the more costly descriptions, as Porphyry, Rose Granite, Broccatella, Brescia, Lapis Lazuli, Malachite, and Florentine Mosaics, and has obtained the Medal from the Society of Arts. Bored Chimney-pieces, from *25s.* upwards. Price lists sent on application to Mr. MAGNUS, PIMLICO SLATE WORKS, 39 and 40, Upper Belgrave-place, London.

*** Roofing and Plain Slate work, of all descriptions, at low prices.

DIXON'S NEW (REGISTERED) VENTILATOR.—This Ventilator is much neater and more simple than any hitherto invented, can be made of any shape, or size, and can be as easily cleaned as any other part of a window. It does not interfere with the blinds, or opening of the windows, and if accidentally broken can be repaired by any glazier at the cost of a single pane of glass. Models can be seen, and every information obtained, by applying to the London agents.—JAMES PHILLIPS and Co., 116, Bishopsgate-street, Without.

HARTLEY'S PATENT ROUGH PLATE GLASS.

JAMES PHILLIPS AND CO., 116, Bishopsgate-street Without, beg to hand their list of Prices of the above description of GLASS. Cut to order in panes of

8 by 6	and under	10 by 8	at 4½*d.* per foot.
10 by 8	,,	14 by 10	at *5d.* ,,
14 by 10	,,	1½ foot, or sizes not exceeding 20 inches long	at 5½*d.* ,,
1½ foot	,,	3 feet, or sizes not exceeding 30 inches long ...	at *6d.* ,,

PACKED IN BOXES of 50 feet each.

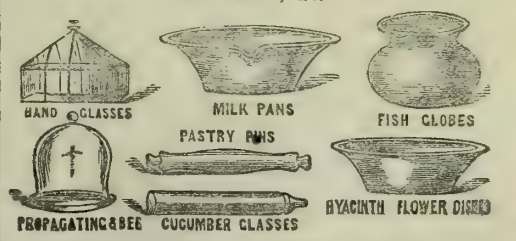
26 oz. ,, 3¾*d.* 7½*d.* ,, ,, ,,

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.



GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the Excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from *2d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from *1s. 2d.* to *2s.* per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from *4d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from *2s.* to *5s.* each. Cucumber Tubes, from 12 to 24 inches long, at *1d.* per inch. Lactometers, *7s. 6d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

ANTHONY'S PATENT AMERICAN CHURN.—At the Avondale Farming Society's Cattle Show, June 13, two sizes of the Churn were tested in the open air—a 6 lb. one making butter in 8 minutes, and a 24 lb. one in 12 minutes. Any female can turn the 24 lb. Churn, without extra exertion, as was the case on this occasion. The Butter was got up in half-pound prints, and sent in to the Dinner. It was equal in quality and hardness to the Prize Butter, and much approved of. The President of the Society took the agency of the Avondale district.—KEY and MITCHELL, 97, Newgate-street, London

GLASS WATER PIPES.

MESSRS. COATHUPES AND CO., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ½-inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

CROWN, SHEET, AND ROUGH PLATE GLASS FOR HOTHOUSES, CONSERVATORIES, &c.

The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

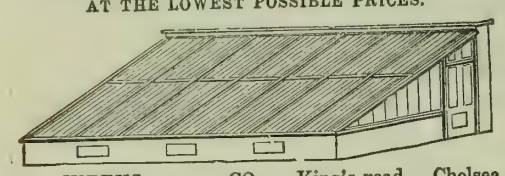
PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co. 48, Leicester-square, London.

MARQUEES, SUN-BLINDS, RICK-CLOTHS, &c. —Manufactory, Old Kent-road, facing the Bricklayer's Arms Railway Terminus, and 17, Smithfield-bars, London.

"The guests are arriving; my villa has got
Quite a park-like appearance—a beautiful spot;
The band on the lawn, in the spacious marquee,
This tent for our dinner, and that for our tea."



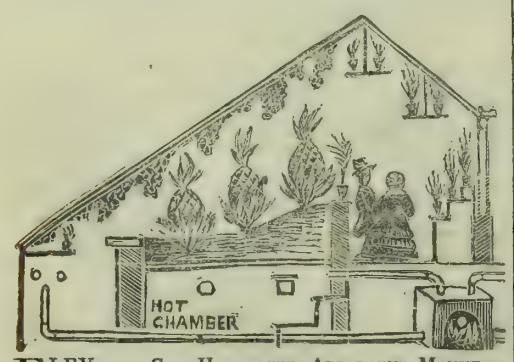
Marquees and temporary rooms superbly fitted up for fetes, &c., on most moderate terms, by THOMAS EDGINGTON and Co.—Tents of every description, Rick-cloths, with poles, &c. Tanned Netting, for the protection of fruit-trees from frost, blight, and birds, and for the security of fresh sown seed either in gardens or fields, at unprecedentedly low prices, viz., 1*d.* per square yard, or 200 yards for 14*s.*, or 500 yards for 30*s.*, or 1000 yards for 50*s.* Sold to gardeners and shopkeepers by the cwt. —New Archangel Mats and Scrim Canvas for wall fruit; Tarpaulings for houses under repair, on hire. Orders and inquiries per post immediately attended to.

TO HORTICULTURAL AND FLORICULTURAL SOCIETIES.

BENJAMIN EDGINGTON, Manufacturer to the Horticultural Society, Chiswick, and the Royal Botanic Society, Regent's Park, solicits attention to his stock of Marquees and Tents of every variety, and suitable for all climates. Orders per post duly attended to. Address, BENJAMIN EDGINGTON, 2, Duke-street, Southwark. A Warehouse, 208, Piccadilly.

TO BE SOLD, on very advantageous terms, a Retail SEED BUSINESS in a good Market Town, with or without a small Nursery.—Address by letter to S. B., Crosby-hall Coffee-house, Bishopsgate-street, London.

HORTICULTULAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.



J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

ELEY AND CO., HOT-WATER APPARATUS MANUFACTURERS, HOTHOUSE and IMPROVED PIT BUILDERS, beg to inform the nobility and gentry, they, being practical and working men, defy competition, and are enabled to supply their IMPROVED PORTABLE CAST-IRON BOILERS, requiring no Brickwork, being more durable than Copper or Wrought Iron, and surpass all others. These Boilers, placed inside the House or Pits with the furnace-doors outside, require no stoke-hole, and prove the most economical mode of heating. 4-inch best Hot-water Pipe, 1*s* per foot; 3-inch, 10*d.*; 2-inch, 8*d.*; Tank-work, 1*s.* 9*d.* per foot. Superior Valves and all other connections equally low. Building and Hot-water Apparatus can be supplied and arranged so that any gentleman's tradesman can fix them, or their own services can be had at a trifling expense. Can be highly recommended by the nobility and gentry, for whom the most complete works have been erected. —The Trade supplied. Estimates free. Boilers of every description supplied. Conservatories in Metal, Iron, or Wood on the most ornamental designs.—Address, City-road, near the Toll-gate, London.

TO AGRICULTURISTS.

ABRAHAM HARDY AND SON, SEED GROWERS, Maldon, Essex, feel pleasure in introducing to their friends and supporters their NEW EARLY YELLOW STONE TURNIP, which they can confidently recommend for field culture. This variety may be sown after Vetches or Wheat with certain success.

The advantageous properties this Turnip possesses over others are—1st. That it comes in quicker by three weeks than the early white Stone. 2d. It is particularly adapted for a hot climate or soil. 3d. It does not taste strong in the driest seasons. 4th. Is a small-bladed variety, and consequently can be grown closer. 5th. It is 25 per cent. heavier than any white variety, and is not diminutive in size. 6th. It is more nutritious than any other, and nearly as solid as the Swede. 7th. Keeps better after storing. 8th. It may be sown three weeks earlier or later than all others, and with equal success.

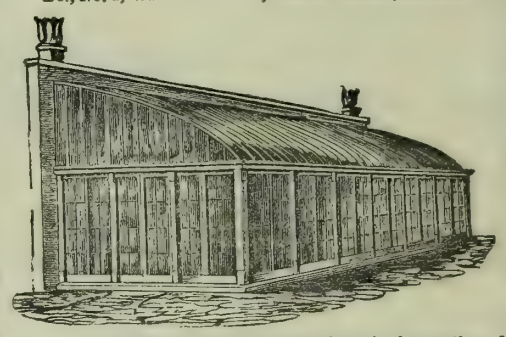
One oz. packets 8*d.*, free by post. In order to test its superior qualities and stock, it may be procured for general crops at 2*s.* per lb. Early orders are requisite, as the growing stock is limited. Orders of 20*s.* or above, carriage paid to London. Remittances requested.

N.B.—A strong Plant, or packet of Seeds, of the HERACLEUM GIGANTEUM can still be sent for 12 postage stamps, post free.—July 6.

SCIENTIFIC ACADEMY AND AGRICULTURAL TRAINING SCHOOL, Kennington, near London, July 1, 1850.

MESSRS. NESBIT take the liberty of directing the attention of Parents to the advantages offered by their Establishment, in the education of youth intended for the Arts, Manufactures, or Agriculture. Though the power, influence, and wealth of England, depend, in a great measure, upon the proper application of scientific knowledge to the working of her minerals and soils; yet, in the education of her youth, Science has hitherto been almost wholly neglected. It is, however, evident that a young man, who, in addition to the common education, possesses a sound knowledge of Analytical Chemistry, Mineralogy, and other kindred subjects, will be the best prepared to engage with success in any technical branch of business for which he may be designed.

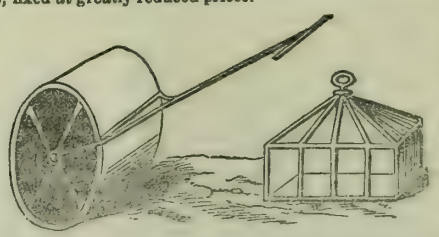
In their system of instruction, Messrs. NESBIT give a prominent position to the physical sciences; and experience has proved that instead of retarding the pursuit of the ordinary studies, they materially assist in their acquirement.



The pupils have repeatedly been examined by some of the first Professors in the Metropolis, who have expressed themselves highly gratified with their general knowledge, and with their attainments in physical science.

Terms and other particulars may be known on application.
38, Kennington-lane, London.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.



Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

COTTAM & HALLEN, ENGINEERS, IRON FOUNDERS, &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON.

COTTAM and HALLEN having had experience in the erection of HOTHOUSES and CONSERVATORIES (made of Iron or of Iron and Wood combined), and from many improvements they have made during that time, can with confidence undertake to erect such buildings with economy and dispatch.

HOT WATER APPARATUS for heating the above and other buildings (of which they have constructed upwards of 3000), fixed at greatly reduced prices.

COTTAM and HALLEN have on show, at their repository, No. 2, Winsley-street, Oxford-street, a great variety of the following articles, for GARDENS, &c., at Greatly REDUCED PRICES, viz.:

Garden Rollers,	Hand-glass Frames,
Garden Engines,	Flower Stakes,
Garden Syringes,	Flower-bordering,
Watering Pots,	Flower Stands,
Garden Vases,	Garden Arches,
Mowing Machines,	Garden Chairs.

Every description of Work, both plain and Ornamental, in wrought and cast iron, for Gardens, &c. &c.

HORTICULTURAL TOOLS and AGRICULTURAL IMPLEMENTS of all kinds.

STRONG IRON HURDLES, strained Wire Fencing, &c.

Show Rooms at the MANUFACTORY, 2, Winsley-street, and 76, Oxford-street, three doors West of the Princess's Theatre.

ASHBY'S INDIA EXPORT PALE ALE.—London Stores, under the South-Western Railway Terminus, Waterloo-road. India Pale Ale, 21*s.*, 18 gallons; 10*s.* 6*d.*, 9 gallons; Family Ale, 16*s.*, 18 gallons.—CHAS. ASHBY and Co. invite the particular attention of private Families and Clubs to their PALE ALE, as brewed by them for the COLONIAL MARKETS for the past 20 years. Supplied in small casks direct from the Brewery, Staines, and the London Stores, or from their agents—Messrs. W. Hancock, 80, Connaught-terrace, Hyde-park; Chidell and Stewart, 40, Lime-street, City; W. H. Chaplin, 11, Sebbon's-buildings, Upper-street, Islington; J. Shenton, Greenwich; W. Ferguson, Reading; Thos. Berry, Brighton and Lewes; A. J. Richardson and Co., Portsea and Southsea; J. Skidmore, Rickmansworth; Cooksey, Brothers, Southampton.

MRS. LOUDON begs to give Notice that she ceased to Edit the Weekly Journal entitled THE LADIES' COMPANION AT HOME AND ABROAD, with No. 27, completing the first volume, and that she has no longer the slightest connection with that Paper.—Bayswater, July 6.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

BELL'S PATENT LIQUID CEMENT is ready for use, and only one-eighth the cost of oil-paint. For beauty it is pre-eminent, giving the exact appearance of FINE CUT STONE. Can be used at once on fresh Roman Cement, or any other plastering, and will protect the walls as well as Roman Cement. In casks of 1, 2, and 3 cwt., at 8*s.*, 15*s.*, and 21*s.*, casks inclusive.

PATENT MINERAL PAINTS.—Invaluable for cheapness, beauty, and permanence: not half the cost of other paints, always ready for use, will keep good for years, and therefore well suited for exportation. Brilliant black, 2*s.*; rich brown, 2*s.* 9*d.*; greens and light colours 4*s.* per gallon.

G. BELL and Co., 2, Wellington-street, Goswell-street, London.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND CO., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

IRON AND WIRE FENCING,
AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS,
252, OXFORD-STREET (NEAR HYDE PARK),
And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of
PLAIN AND ORNAMENTAL IRON AND WIRE FENCING,
Park Entrance, Carriage and Field Gates, Wickets, &c.;
Deer, Sheep, and other Hurdles;
Hare and Rabbit-proof Wire Fencing;
Iron Bedstead Makers to the Board of Ordnance;
And Government Contractors.

The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility, and on the most moderate terms. Drawings made and estimates prepared, if required. The show-rooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	¼ in.	⅜ in.	½ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s.* 5*d.*	0*s.* 6*d*	0*s.* 8*d.*	0*s* 10*d*	1*s.* 0*d.*	1*s.* 2*d*	1*s.* 4*d.*	1*s.* 6*d.*
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

MESSRS. KNIGHT AND PERRY feel themselves called upon to thank their numerous patrons very gratefully for the confidence with which they have recurred to them when in want of Gardeners, and beg respectfully to say that the scrutiny and vigilance they have always employed in selecting good and clever men (to which the almost invariable satisfaction that has so long attended their recommendations is mainly attributable) is, if possible, increased now; and the steps they have taken to arrive correctly at the professional and private character of those they send out as GARDENERS, FORESTERS, BAILIFFS, &c., induce them to undertake unhesitatingly to furnish first-rate men in these capacities whenever called on to do so.

Exotic Nursery, King's-road, Chelsea, London.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD SUSSEX.

WM. WOOD AND SON'S extensive collection of ROSES is now in fine bloom, and will continue during the season. An idea of the extent may be formed when it is stated that Forty thousand Standards may be seen flowering in one bed; also many Thousand Dwarf, Dwarf Standard, and Standard Roses, covering many acres of ground.

Coaches run (each way daily) from Brighton to Tunbridge Wells, one of which passes through Maresfield, and within five minutes' walk of the Nursery.—July 6

HUGH LOW AND CO. have to offer a fine and extensive collection of CHRYSANTHEMUMS, in strong established plants, including the greater part of the French varieties of last season, at 6s., 9s., and 12s. per dozen; also 10 varieties of the much admired Liliputian Chrysanthemum, raised by Mr. Bouamy, of Toulouse, and sent out last summer for the first time. Price 1s. each.

In addition to the above, H. L. and Co. have imported largely the new Continental Verbenas, Phloxes, Fuchsias, &c., a list of which can be had on application.—Clapton Nursery, July 6.

The Gardeners' Chronicle.

COUNTRY SHOWS.—Tuesday, July 9: Whitby Floral, and Lichfield Floral and Horticultural.—Wednesday, July 10, and Thursday, July 11: Leeds Horticultural and Floral.—Thursday, July 11: Malvern Horticultural and Floral.

The great and good is gone! Mourn, England, mourn the gentle heart and iron nerve that saved you at your utmost need. Sir ROBERT PEEL is dead.

OUR readers are aware that notice has been given of the reappearance of the POTATO DISEASE here and there in Ireland. Knowing, as we do, the great extent of land unhappily replanted in that country, a general failure of the crop cannot be anticipated without very serious apprehensions. We believe, however, that the alarm which has been taken may be described to be premature. That disease has reappeared is certain; and in more places than have yet been mentioned, as about Kenmare for example. Nevertheless, the cases are few and far apart, and could probably have been paralleled last year, which was a favourable season.

We say this with a view to allay such alarm as has been taken. At the same time, it is our duty to declare that it is a serious mistake to imagine the Potato disease to be gone. On the contrary, a good many instances of its mischief in our English counties last year might be named, and in the month of April last we saw Potatoes rotting in bins, in Hertfordshire, exactly as they rotted in the Dublin cellars in 1845. Probably, if we should have a hot dry autumn, there will be little to fear, provided, as is said, the Irish have at last discovered the importance of very early planting. But it is to be remarked that we have before us the danger, and something much more than the danger, of a wet autumn; and if that should unhappily occur, no man can foresee to what extent the Potato rot may spread once more.

Should it again ravage Ireland, it can only be regarded as a visitation of Providence for the purpose of arresting the progress of that fatal course—Potatoes, pigs, cabins, conacre, and above and beyond all, competition for land—which has brought the western province of the British empire into a state of all but hopeless ruin.

MUCH as the cultivation of the Pear and other fruit-trees has been improved, by grafting upon suitable stocks, with the view to make them bear sooner, and also by ROOT-PRUNING in November, so strongly and clearly described by Mr. RIVERS, in his "Miniature Fruit Garden," yet, in some soils and situations, they grow so late in autumn, and ripen their wood so imperfectly, that mere winter pruning and summer stopping are not sufficient of themselves to effect the desired end. This over luxuriant habit of growth is mainly induced by stimulating soil, aided by the mulching generally applied as soon as the young trees are planted, after coming from the nursery. So well have Pears in particular been managed of late years, by some of those who have made it their business and study to provide the public with the best kinds on the most suitable stocks, that we not unfrequently see them come from the nurseries in the most perfect condition; being handsome miniature trees, with numerous short-jointed shoots, covered with beautiful well-matured buds, ready to burst into bloom, while the warmth of spring is scarcely yet perceptible. This is partly the result of frequent root-pruning and removal, with the view of inducing fruitfulness; and fruitful they are, for we have had no fewer than a dozen fine Pears upon a small tree, the first year after planting. But it is a question whether cutting the roots in winter is the safest time for the operation; for if much rain happens to fall, and the soil becomes soddened, the newly-cut parts may, and often do, suffer injury. The practice of cutting the roots yearly while the tree is young, and before it has attained the size desired by the owner, tends, on the one hand, to cripple its energies, and make it old when it is yet young; while the extremely fruitful habit of the trees, as now sent out, is incompatible with that quick growth which we all like to see in trees intended to be trained to a particular form and size, and kept to that, when it is once attained, by judicious root-pruning.

The new owners are, of course, delighted on receiving such trees from the nursery, and are soon busy in placing them in their stations in the garden. The trees are planted, staked, and mulched, and in dry weather during the first spring, well watered. All this is perfectly right; for although the young trees are interesting to look at in their dwarfed state, most people prefer having them of a larger size as soon as possible; and trained either into a handsome pyramidal form, from 4 to 6 feet high, well furnished with shoots from the base to the top, or it may be into a cylindrical or an umbrella shape according to fancy. In order to cause them to attain the form and size desired in the shortest possible time, good soil, and careful management as to mulching and watering, with frequent stopping and training for a few years, are indispensable. But during this time the plants in most soils lose that short-jointed and fruitful habit which the skilful nurseryman had been at such pains to give them, and acquire what may be termed a rampant habit of growth, notwithstanding that the depth of soil in which they are planted has been limited to a foot or 18 inches, and rests upon an impervious bottom of rubble and concrete to prevent their roots from going too deep.

Now as rapid growth and a fruitful habit cannot obtain at the same time, the great matter is to be enabled to grow the tree into the form and size desired in the shortest space of time, and then, in one season, to bring it into a fruitful state. The former of these objects can easily be attained in the manner mentioned above; and the latter, which is the more important, would, we presume, be a desideratum to many of our readers, who, like ourselves, would prefer seeing trees covering their allotted spaces quickly, and without regard to having more fruit than chance or good seasons might produce while this is going on; and afterwards to be enabled to ensure plenty of fruit-buds for the ensuing season.

To many it will be a startling assertion, but it is true, that the best time for root pruning fruit trees, with a view to make them ripen their wood well, and set plenty of fruit-buds, is in July or early in August; or in forward situations, as soon as they have formed their first growth; for many trees make a second shoot, or what is termed a midsummer growth, among which are the Apple and Pear; although vigorous young trees sometimes continue to grow throughout the season until their progress is arrested by cold on the approach of winter. Than this latter state, nothing can be more unfavourable to the production of fruit; and to remedy it quickly, summer root pruning is a certain means; as the moment the operation is performed all growth is checked, and the perfect elaboration of the sap in the tree commences. This principle applies to all fruit trees, whether trained on walls or kept as standards, that are unfruitful or in too gross a state. It also accords beautifully with the system of summer pruning and stopping, as a proper balance is preserved by it between root and branch. The natural tendency of an over vigorous tree, after being stopped, to throw out a forest of laterals, is also prevented. The excessive flow of sap in the tree is checked at the warmest period of the year; and any fresh accession of crude juices from the root, being in a great measure stopped by the root pruning, the sap already in the tree, through being acted on by the heat of autumn, becomes perfectly elaborated, and fruitfulness is the result. I have never seen a tree so treated that has not been covered with fruit buds in the autumn, and when a favourable spring followed, an abundant crop has been invariably obtained; while, by November pruning, the grossness of the following season only is checked; and in the summer which intervenes between the period of root pruning and the time when the fruit may be expected, the trees not unfrequently recover their over luxuriance, especially in rich soil, or moist situations. As a matter of course, this process is unnecessary with trees in a bearing state; but those with only a partial crop, and which are growing too freely, may be moderately root-pruned, without danger of the fruit suffering; taking care not to neglect giving a good soaking of water immediately after the operation.

It is certainly a great triumph in the art of gardening, to be able to bring Pear and Apple-trees into a bearing state while they are young, and only two or three feet in height; and it also affords satisfaction to purchasers to ascertain (often in the first year after planting), if the trees they are to be at some pains with, are the kinds they wished for; but in order to give them a stronger constitution than trees can have which are constantly kept in a dwarfed state, we are of opinion, that it will be found better to allow them to grow pretty freely for a few years, after they are planted in their permanent situations, and then summer root-prune them.

We confess that we often envy the position of those who are situated where fruit trees ripen their wood, and bear, with scarcely any assistance in the way of root-pruning. In such situations, the grower has only to order his trees already in a bearing state, as supplied by our leading nurserymen, and he will secure plenty of the finest fruit from the season in which they are planted, instead of having as formerly to wait for years. Some trees planted by ourselves in February 1849 have this year made shoots from 3 to 4 feet in length; and some pyramidal trellises 5 feet high and 3 feet wide at the base are becoming pretty well covered with wood. These trees we shall root-prune in a few days, commencing by opening a trench round them about 2 feet from the stem down to the hard platform below; and all the roots that are inclined to be strong will be cut back to within 18 inches of the stem: but few, except the stronger leading roots, will have advanced so far out at present, and by shortening these, the vigour of the trees will be arrested, and some fruit buds will be formed in the present autumn. Some Pear trees grafted on Pear stocks, covering an arched trellis 60 yards long, 6 feet wide, and 9 feet high, were root-pruned, for the first time, in July, 1848, when the trees, which had been planted five years in strong rich soil, were exceedingly gross. The result of this was, that, in 1849, we had a plentiful crop of fruit on every tree; although, previous to this, scarcely a Pear was obtainable. Numerous other instances of success with Pears, Apples, Peaches, and Apricots, could be mentioned, but it is scarcely necessary. The only difficulty which amateurs are likely to find, in applying this system of root-pruning, will be in determining the distance from the stem at which the trench should be made; and it is not easy to give precise directions on this point. Trees that have only been planted two, three, or four years may, with safety, be cut to within about 2 or 3 feet of the stem, proportioning the distance to the size which they may have attained. The roots of trees may, by frequent pruning, be kept within a comparatively small space, by beginning with them the second or third year after planting, and at every successive operation going 3 or 4 inches further from the stem, and adding some fresh loamy soil; but trees that have been long established, and have not been root-pruned, should not be cut too close. Apricots and Peaches may be kept in a fine bearing state by root-pruning in the summer, when they have no crop, and early in the autumn when they have a crop, but are still too gross. We operate upon wall trees in this state as soon as the fruit is gathered, and the wood ripens admirably.

It will be well to add, by way of conclusion, that after pruning or shortening the strong roots, which are the cause of unfruitfulness, we put some decayed turf, or fresh loamy soil against them, in order that they may strike freely into it; which they immediately do, as the season of growth is at its height. The food supplied by the new roots during the autumn will have nothing crude in it; but will supply sap of a kind calculated to form fruit buds. In soils where the Pear bears well naturally, without all this labour, it will be superfluous to meddle with it; but hundreds will be glad to avail themselves of a simple, quick, and certain means of ensuring fruit buds in a month or two, where there was before nothing but masses of watery, fruitless shoots. *F.*

ON TRANSPLANTING LARGE EVERGREEN TREES AND SHRUBS.

IN your Leading Article, at p. 387, some observations are made upon experiments which were instituted to confirm or otherwise the views I advanced in a communication to the London Horticultural Society. It might be inferred from the remarks you have made on more than one occasion, that this very important consideration in ornamental gardening—the transplanting

of large evergreens at the particular season I have recommended, is a new light thrown upon the subject, but this is by no means the case. The late Mr. M'Nab, of Edinburgh, published a pamphlet on transplanting, many years ago, and the views therein set forth went to perpetuate the vicious and fatal plan of winter transplanting.* His opinion on all matters relating to gardening are entitled to the highest consideration and respect; but from repeated trials I have found that early autumn is the most preferable season for the operation. In 1826, which was hot and dry, I had a large number of evergreens either to cut down or remove, in consequence of some alteration which required the work of transplanting to commence in July. The shrubs were of different kinds, most of them requiring horse labour to drag them on trucks to their new quarters. My success was perfect. I had subsequently numerous opportunities of proving the importance of early autumn planting up to 1836, when I made the following remarks, after the publication of Mr. N'Nab's views, in a gardening work of the day.

"The observations I have now to make are applied to the transplanting of large plants, as small ones may be removed at almost any season with nearly equal success. I may premise that an opinion, and not an erroneous one, is commonly entertained, that, should evergreen shrubs be removed during the months of November, December, January, and February, the effect will be nearly the same. Notwithstanding this, I am still, however, persuaded that there is a certain time better than any other for performing every operation, especially of gardening, the data for the fixing of which are found in the immutable laws of vegetable economy.

"The period, then, of the greatest action in the economy of evergreen shrubs is surely not the most desirable time for transplanting them; neither can that be the most fitting season when they are in a comparatively torpid state. In the former instance, the plants will suffer from the natural season of excitement, which the more or less unavoidable mutilation of the roots will render them unfit to sustain; whereas, in the latter case, the fibrous roots will perish from the extended period during which the plants will be compelled to remain in a torpid condition. Well, then, a time between the two extremes (say during the month of April) may be suggested; but this would be a fatal suggestion, as at this season vegetable life is waiting the influence of a genial sun to discharge its accumulated provisions into leaves, flowers, and fruit. The branches must sympathise with the roots, which, at the three periods cited, ought not to be disquieted. It will be perceptible, from the preceding observations, that there is yet another season at which the proceedings of the skilful and cautious may be rendered successful; and the guide for discovering this period is a very simple one. The time I propose shall be alike free from the extremes of either present or immediate prospective excitement, and shall yet not be the season of maximum transpiration. It is a well known and understood fact, as well as a matter of common practice, that the successful propagation of a great number of evergreen shrubs is prosperously effected at the time the young shoots have attained a firmness of texture easily distinguished by the practical operator. We may instance the Laurel, Camellia, &c, which will have arrived at this condition about the end of August. These cuttings then contain abundance of the active circulating fluid, which, in its downward course, forms a callosity which presently emits roots. It is this time, during the declining year, which I have found the most desirable season to conduct the operation of transplanting evergreen shrubs. The young shoots at this season will have attained maturity to render their suffering from removal, or from the aridity of the season, very trifling; as the whole plant will contain enough of the active sap to propel fresh spongioles when located; so that, after a copious watering, the general appearance of the plant will have sustained little change."

Such were the opinions I entertained 14 years ago upon this subject, and extensive experience during these last 7 years in different parts of England, where local circumstances have considerably varied both in respect to soil and climate, fully confirm their soundness. Transplanting at the particular period I have recommended, does not rest upon hypothetical grounds, but upon well tested experience, extending over a period of more than 20 years; the result has long ceased with me to be matter of speculation or doubt. Some, however, have been successful at other seasons; as, for instance, Mr. Barron, whose operations at Elvaston Castle have been of the most extensive kind. He prefers moving shrubs in the middle of their growth. Supposing that a large shrub, say 20 feet high, and the same in diameter of branches, was about to undergo the operation of removal from the position it had occupied for many years previously, we may infer that had such a shrub been allowed to remain where it was, it would have extended its branches a foot in all directions. Mr. Barron would consider the middle of its growth, when the shoots had grown probably about 6 inches, the best time for transplanting it. Now this appears somewhat startling. One can readily imagine that small plants might be shaded and kept moist, but this could not have been done with the gigantic subjects operated upon at Elvaston. It is quite clear that plants so treated must either grow or die instantly, especially in such a season as the present. If they do not instantly root into the soil, the fierce action of the sun must soon exhaust the sap. Their existence, therefore, depends upon an immediate supply from below.

The success which has attended this apparently paradoxical period for the transplantation of large evergreen trees and shrubs at Elvaston, places the matter, however, beyond cavil or doubt. Mr. Barron is no wild experimentalist, but a most successful operator of long and extensive practice. We have here (for there is no denying the fact) the longest and hottest days of the year recommended for this work, in opposition to the old practice of performing such tasks in the dead of winter. The sap, in the one case, is in the highest state of action; in the other it is dormant. I will leave those who take an interest in this subject to reconcile these apparently opposite practices if they can. *R. Glendinning.*

* Mr. M'Nab's words are: "Although, however, I have planted evergreens 10 months out of the 12, with little difference in the success, yet one season has a preference over the others with me, and when there is a power of choice, I would recommend late in autumn, winter, or very early in spring; that is, any time from the middle of October till the middle of February, and in general the beginning of this period is best." Page 16. Ed.

DISEASES OF PLANTS.

(*Continued from p.* 404.)

GENUS III.; *one species.* BUNT (*Golpe or Volpe or Fama*).—I restrict this name to a disease particularly fatal to Wheat in our country, by which, although the external form of the ear remains intact, the inside of the grain is more or less corrupted. Ginanni calls it Grano carbone or charred grain. In Lombardy it goes generally by the name of Fama, although sometimes by those of *carbone, carboncino marzetto.* The French, after Tillet, call it *Carie.* It appears certain that it was first introduced into Italy, and more precisely into Lombardy, with grain imported from Hungary during the war about the year 1730; from thence it spread into the Romagna towards the year 1738. Having last year had unfortunately abundant opportunity of observing it, I am enabled fully to confirm what I had stated from the writings of others in my "Elements of Agriculture," and to give the following details with greater accuracy, This disease appears at the moment of the germination of the plant. The affected individuals are of a dark green, and the stem is discoloured. As the ears are issuing from the sheaths, their stalks are of a dark green, but very slender. When the ear has fully grown out, its dull dirty colour causes it to be immediately distinguished from the healthy ones, and it soon turns white. From the first the diseased ears are larger than the healthy ones, and are sooner matured. What appears singular, but which I have not perhaps quite sufficiently verified, is, that the seeds are more abundant than in a sound ear. The seeds have a more oblong form, though their absolute length is less than that of good ones; they are of a brown colour, and at one end are two filaments joined together and turned upwards. The lower extremity shows the scar or point of attachment with the receptacle. The inside of the grain is converted into a blackish, fine, viscid, glutinous substance, insipid, but very fœtid. It is remarkable that it is not all the ears of one plant that are infected, nor even all the seeds of one ear, and it happens sometimes that one part of a seed only is corrupted; it thus remains half black and half white. The outer covering and chaff remaining sound, and the seed preserving its form, may serve alone to distinguish the bunt from the smut.

I cannot affirm that this disease is confined to Wheat and Rye-grass. It appears certainly to be contagious, from numerous experiments, which show that the contagious principle lasts a long time. I have tried it myself. Some, however, doubt it; but it cannot be denied that seed sown infected with bunt, produces plants similarly affected; every one who has had the slightest experience must be convinced of it. Some have inquired whether all kinds of Wheat are equally subject to it. It appears that the *blé de miracle* (Triticum turgidum, Vill.), and the *touzelle rouge* (a long-reeded, beardless, red Wheat), are the least attacked.

It would carry me too far, and would be of little advantage to enter into an examination of the different opinions given as to what produces bunt, which Ginanni considers as one disease with the smut, the latter being its last stage. I shall at once proceed to mention the certain preservative against both diseases, and which may be applicable to all analagous diseases affecting the seed from the moment that it is placed in the soil.

In the first place, although experience tends to show that over manuring cannot alone give the bunt, yet it has been observed that there are always a greater number of infected ears in fields where the dung has been mixed with the refuse of the threshing-ground;* it is therefore a matter of common prudence to avoid mixing with the dung for corn fields any kind of matter proceeding from infected plants, unless it be fully decomposed by fermentation. This is a point of great importance to attend to, with the present custom of using manures too fresh, to which abuse may be ascribed a great number of the diseases in our corn-fields. Whoever has the misfortune to have bunt in his corn is well aware that he must only select for seed perfectly sound and healthy grains. But as notwithstanding that attention he is not safe from the reproduction of bunt, he must steep his seed corn. Books of agriculture are full of receipts more or less stamped with quackery, and the more they are enveloped in learned verbiage and calculations, the more they are apt to mislead the unwary. I can reduce them all to two, of which I have myself witnessed the success, and in favour of which I can adduce the testimony of a great portion of the agriculturists of my department. In the year 1806 we had a great deal of bunt, but all those who had followed the course I am about to recommend were free from it. The seed corn must not only have been winnowed in the ordinary way, but it must be repeatedly tossed in the air with the shovel, in order to deprive it of any dust which may remain with it, as where the bunt has been very abundant, a single steeping may not be sufficient to destroy it all. Tessier remarks that the steeping has the advantage of causing to float all bunted grains which may chance to remain, so that they may be removed with a skimmer.

Take quick-lime in the proportion of one measure of lime to 24 measures of corn, and let it be quite fresh and in lumps; its strength may be ascertained by throwing it into cold water, when it should immediately effervesce. Those who sow at different periods, must always take care to have fresh supplies, as the lime is useless when old. I have said one twenty-fourth of lime is sufficient, but even one-twentieth may be better. Take of water one-fourth or fifth of the Wheat in weight, not in measure. Divide the water in two equal parts, boil one-half and throw the lime into it, to slake whilst it is boiling, then stir it about, and pour in the cold water, or put the cold water in the tub or vat in which the corn is to be steeped, and then empty the cauldron with the lime into it. The grain must be put in as soon as the liquor is cool enough not to injure it, and left for 24 hours, after stirring it well up with a stick, and skimming off all the bad or diseased grains which rise to the surface. After 24 hours the corn must be spread out to dry and sown immediately. Some toss it, if the weather permits, in order to get rid of the lime, that it may not hurt the hands in sowing it. Others get rid of the lime by passing the grain through a wire sieve—the presence or removal, however, of the lime makes no difference as to the growth of the future crop and its freedom from disease.

Some, instead of using pure water, prefer a lye, or water passed through wood-ashes and boiled with them as for washing. Others again mix with the water liquid manure from stables. All these practices are good, as they tend to add to the certainty of success of the preventive process.

Circumstances may render the procuring hot lime either very difficult or impossible; its place may then be supplied by a lye (*lessive*) of wood-ashes fresh burnt; to which should be added liquid manure. If fresh ashes cannot be procured, soda or potash may be substituted; and in this consists the second method. But it is much more expensive and less certain than the steeping in lime-water. This steeping, although now commonly practised in some localities, is still almost unknown in others, as in the department of the Reno. If once universally adopted it might entirely deliver our Wheat fields from this pestilence.

Two observations, made in various places, deserve to be recorded. Wheat sown deep is proportionately more affected by the bunt. So also that which is sown in fresh ploughed ground, probably from the seed falling deeper into the ground. Perhaps the grain which remains near the surface suffers less from the bunt being washed away by rain, or deprived of its malignant qualities. Lastly, I would remark, that if bad cultivation, and especially bad drainage does not produce bunt or smut, it is certain that those fields, the worst treated in these respects, suffer the most from these diseases.

* In Italy, as in the greater part of south Europe, threshing is performed by treading out the corn on open threshing-grounds, which leaves a great deal of refuse after the corn, straw, and chaff have been collected; and winnowing, on the same ground, by tossing the corn into the air with a shovel, so as that the wind shall blow away the chaff.

VILLA AND SUBURBAN GARDENING.

GLASS structures contribute pleasure and interest only in proportion to the continued floral display maintained in them, and when we consider how easily this is affected by a judicious selection of easily cultivated plants, it is astonishing to find plant houses, during summer and autumn, where the principal stock which they protect during winter is placed in the open air, presenting a naked and cheerless aspect, in no respect assimilating with the season. What can be more easily cultivated than a Balsam? Yet how frequently do we find this beautiful plant forgotten, or if remembered, presenting anything but vigour or perfection of growth. I maintain that with no very great attention, and with little gardening knowledge, an amateur may produce Balsams in first-rate beauty. Let us see then, what system is to be adopted, in order to attain this point.

The first thing is to get seed of good double varieties of various colours; the mottled kinds are much prized; the selfs, if double, are, when in perfection, much and deservedly esteemed; the seed, if sown in March, will be early enough to supplant the greenhouse plants. It should only be slightly covered, and placed in a stove, or the warm end of a greenhouse, or in a Cucumber or Melon frame; but be careful that it is protected from mice, for if within their reach the whole may be destroyed in a night. When the plants are 2 inches above the soil, and the cotyledons fully expanded, they should be potted singly into 3-inch pots, and placed close up to the glass. During their whole culture, let this be kept constantly in mind, or they will soon become drawn and feeble, and the beauty of their cultivation depends much upon their habit and sturdiness of growth. When they have attained the height of 6 inches, they may then be shifted into the pots in which they are to bloom;

8-inch pots will be found a good and convenient size for this purpose. And let me urge the importance of growing no more plants than space can be well found for their perfect expansion, in order that they may have plenty of air, and also that an opportunity may be afforded of fully viewing each plant individually. When they begin to expand their blossoms, diluted guano water will be of great benefit to them. Should the weather prove hot and dry, place them in pans, which can be supplied with liquid to enable them to sustain the dry weather without injury.

The Balsam being a gross feeder, the soil should be of a rich nature. Equal parts of loam, leaf-mould, and decayed manure of the richest kind will suit it, and by using such soil and feeding with liquid manure, fine examples of cultivation will be obtained in comparatively small pots, which is without doubt the object which the villa cultivator, should more especially aim at accomplishing, with a view to securing variety in the little space he has for such plants. Let him bear in mind that they are mere annuals, and not destined permanently to occupy any portion of his limited space. *Pharo.*

Home Correspondence.

Summer Pruning the Vine.—Among the physiological questions bearing upon horticulture, none is more important than that which involves the connection between the head and roots of a plant. Not that an important connnection is not admitted and appreciated by all good gardeners, but because the real nature of that connection is not understood; and I am desirous of raising a discussion upon the point, because it has become the fashion in these latter days to draw practical conclusions from what I conceive to be false premises. I have chosen the Vine as the subject of illustration, because the practice which I am about to call in question is oftener prescribed for that plant than any others, and because one instance is as good as a thousand. The practice I allude to is that of allowing the laterals produced from the effects of "stopping" to grow to a considerable length, under the impression that by so doing the roots are materially augmented and strengthened preparatory to their being called into action in the ensuing season. Now I cannot understand the grounds upon which such a conclusion is based. I can fully appreciate the intimate connection between the well-being of a branch and that of a root, but cannot perceive why an unnatural growth—and the production of laterals induced by stopping a growing shoot is essentially unnatural—can in the remotest degree augment the bulk or efficiency of the roots of a plant. In your "Calendar of Operations" for June 22d, under the head "Hardy Fruit Garden," occurs the following sentence, which refers to the Peach, but the principle is the same as that immediately under discussion: "Stopping will cause many laterals to be produced, but of these one only should be allowed to grow at or near the point of each shoot, with a view to maintain a healthy activity at the roots, and to secure an escape for any superabundant sap." Here the stopping is evidently not meant for the purpose of increasing the amount of wood, by the production of laterals, because we are directed to destroy all but the leading one, but we are told it is with the view of maintaining a healthy root action. I am glad the writer has constructed the sentence so as to imply a doubt, because from that I infer he has no just grounds for believing the result aimed at will be realised. It would be difficult to conceive how it could be; but perhaps some of your correspondents well versed in these matters will give their experience upon the question. In the meantime it may not be amiss to investigate the principle by the theoretical axioms of physiology, which, by-the-bye, is, I believe, the only test which has hitherto been applied to the opposite side of the question. And when we recollect that very opposite conclusions may be drawn from the same premises, in other subjects than physiology, it can excite no wonder that it should be so in this. The growth of a Vine shoot is, as every one knows, very rapid, and in its earlier stages perfectly independent of root action. A Vine may be covered with shoots, the whole of which are several inches in length, the production entirely of organisable matter stored up in the tissues of the wood during the last season of growth and maturation. During this, which may be considered the preliminary process of development, the shoots consist of simple cellular tissue, possessing all the elements of bark, wood, and pith, but presenting no distinction of parts, beyond the external organs, leaves and tendrils, or the nascent bunch of Grapes. The leaves possess no power of assimilating, in fact they perform no functions whatever; they are, in the state of which I speak, mere extensions of the cellular matter of the shoot. But presently the wonderful process—of which we know nothing but by its effects—organisation, commences; the base of the shoot assumes a solidity of character, and you can distinguish the several parts of which it is composed, and the leaves assume their functions; in a word, the vital energies of the plant are roused, and the roots commence their office, and the whole body of the plant rapidly increases in bulk. In this stage we will imagine a shoot 3 feet in length to be reduced to 2, by destroying its point, of course laterals will be immediately produced in abundance. The question is, will the growth of such laterals beneficially increase the organic matter of the tree, and the capability of roots for another season. I think not. The substance of such laterals is produced mainly from the shoots which produce them, and no good result can arise from expending in laterals, to be afterwards destroyed, what should have formed part of the shoot to be retained for the next season's bearing wood. I cannot understand the policy of topping a shoot, to induce others to grow, afterwards to be cut away; nor upon what principle of physiology laterals can augment root action beyond that of a leading shoot. I can only look upon lateral shoots produced after the destruction of a leader, and allowed to ramble, as robbers of the vital juices of the plant producing them. If at the period of cessation of growth in a shoot, we could fix upon the precise time to gradually destroy all buds not required for the next season, and to throw all the powers of the plant into the remaining ones, then we should have arrived at the acme of scientific pruning. That this could be done there is no doubt, because it is possible; from such treatment the best results must follow. But by allowing a tree to become a wilderness of spindly laterals on the one hand, or to destroy a leader merely to allow a lateral to take its place, as recommended in the case of the Peach on the other, appears to be anything but judicious. If my conclusions are wrong, I shall willingly acknowledge my error. *George Lovell.*

Swans.—I believe a swan may be kept on a piece of water of almost any size; though if "W. C.'s" pond is very small, it will be necessary to feed the bird, at all events in winter. Eight swans, four old birds and four cygnets, have done very well here, on about four acres of water. I think a single swan, if pinioned, would remain quietly, for one of mine was "sent to Coventry" by the rest, and has since remained by himself on a small stream within sight and reach of the other birds, without attempting to associate with them. The water here is subject to the "green scum" of which "W. C." complains; it always rises to the surface in very hot and calm weather. The swans are most useful in keeping down other weeds, but I think they do not eat the "green scum;" at least, not in any appreciable quantity, though, from their size and strength, they are able to swim through it, and break it up, when it is gradually carried away by the current. If "W. C.'s" pond has no stream running through it, I fear the swan alone will not do much good. Yarrell, in writing of swans, says, "their food consists of water-plants, &c., and occasionally small fish; a swan has been seen to eat a small roach." I infer from this, that fish is not their usual food, and as far as my own observation goes, I believe they do little or no harm to my trout. The large trout, however, devour many of the small ones. *B., Canterbury.*

Botanical Nomenclature.—The shifting and inexact character of English names, when not vernacular (as in many translations), and their frequent variation in different localities, even when of indigenous growth, are some of the objections which might be urged against a very general adoption or substitution of English names in the stead of the usual classic ones. The inconvenience and uncertainty of *aliases*, which exist now in the case of technical or scientific names, would be increased to a great extent, under circumstances in which a greater number of botanists than are competent or willing to meddle with the dead languages would feel themselves justified in christening novelties. English names, too, are in general longer, more compound, and less easily remembered, because less strikingly different from common language than are the classic names now employed. As to the information they convey, it amounts to nothing without some previous knowledge, and with this knowledge such classic names become nearly if not quite as instructive; besides no names can be sufficiently descriptive to be of much assistance towards identifying plants, but often mislead (as in the many instances where the most expressive or characteristic term has been forestalled by some earlier-named species). To make any name of any use as a means of leading to the recognition of a given plant, whether used orally or otherwise, there must have been a distinct act of the mind in the person to be informed identifying the one with the other; and there must be a distinct act of memory recalling that identification. It is in this lies the great effort of learning the names of plants to any practical use; and this must be equally gone through whether the names be English or classic ones—the mere learning and remembering of which, in either case, requires no more effort than would be needed to commit to memory a portion of an English vocabulary. In short, the idea or form (of plant) to be conveyed by the name must be learned, and the form to which the name is to be applied must be mentally recognised; and the connection between the one and the other must also be realised in the mind, before the name of a plant can be said to be known, or can be really made use of. These several acts of mind appear to be as easily brought out in connection with a classic as with an English name—often, indeed, much easier, from the simpler character of the former. Therefore but little advantage—so far as aiding the learner—seems to me to be likely to follow a more extended use of Anglicised names; and none in comparison with the inconveniences likely to arise from the multiplication of *aliases*. If, however, English names are by common consent to be preferred, the Anglicised scientific name, in which enough of the latter is preserved for identification, is decidedly preferable to either a literal or a free translation. I must doubt, however, whether the advantage to be gained by the unscientific is of such moment as to require that the naturalist should "burthen his memory with two names instead of one—the vernacular and the technical." Those who wish to know the names of plants must bestow the smal amount of application required to master them. By those who have little other employment the change would no doubt be hailed with pleasure, as it would open up a new kind of study, in which they might show off their acquirements. Change is not always reform. *M.*—As the Report of the British Museum Commission cannot be in the hands of many of your readers, I beg to hand you the following paragraphs containing the valuable opinion of Professor Owen, on the subject of popular nomenclature. "*Q.* 2641. How far would you advise giving the vernacular names?—*A.* Only to the extent of the actual existence, so to speak, of a vernacular name; only to such an extent as that the vernacular name should be understood. I should conceive that the inventing of English literal translations of the technical names of science, where no English equivalent existed previously, was multiplying what appears to the unlearned, generally, one of the pedantries of our science, viz., the manufacture of hard names. The rule, with regard to the introduction, and there must be such an introduction of technical and scientific names, into one common language, would appear to be by giving an English form to the compound, whether from the Latin or Greek. As, for example, the word mammal, which has become an English word, may be applied, in the singular number, more accurately in many cases than the word 'quadruped,' which seems more vernacular from having been longer in use, and it can be used with an English plural, mammals, converted from the Linnæan term mammalia, given to the class.—2642. Do you consider that it would be advisable to exhibit such names as are contained in the list which I will now read you: Gyrodus macropthalmus, the large-eyed Whirltooth; Acrotemnus Faba, the Bean-like Cutridge; Rhacolepis brama, the Bream Ragscale; Sparnodus macropthalmus, the large-eyed Gaptooth; Isurus macrurus, the great Eventail; Ductor leptosomus, the Slender Guide; Hybodus grossiconus, the large cone Hunchtooth; Dendrodus strigatus, the streaked Shrubtooth; Holoptychius nobilissimus, the noble Allwrinkle; Pachycormus macropterus, the large-finned Thicktrunk; Belonostomus cinctus, the border-toothed Needlenib; Pygopterus Humboldti, Humboldt's Hind-wing; Sauropsis latus, the broad Dragon-face; Dopedius Colei, Lord Cole's Aistrefish; Coccosteus cuspidatus, the prickly-pointed Berry bone?—*A.* I perceive that these are attempts to give English equivalents to technical names principally of fossil fishes; but such equivalents, if exhibited to the public, would be more apt to excite a smile, and to throw an air of ridicule over our attempts to make the rarer things of science familiar to the public, than to produce any benefit.—*Report, page* 127." *Nomenclator.*

Rhododendrons.—It is stated by Messrs. Standish and Noble, in your Paper of the 15th ult., that "in the Himalaya Mountains the Rhododendron is invariably found growing near or on the margins of morasses." As this is put forth with a view of giving hints for the successful cultivation of Rhododendron arboreum, I think it worth while to mention that I have seen many thousand tree-Rhododendrons in the Himalayas, and I never saw one near a morass. In fact morasses are very rare in the Himalayas, and over many miles of country thickly studded with Rhododendrons there is not such a thing as a drop of water to be found. Rhododendron arboreum grows on the Himalayas in disintegrated granite, mica slate, and gneiss, without anything approaching to peat. Rhododendron nilagiricum, a species first indicated by Zenker, and one I believe generally considered distinct from arboreum, does in the Neelgherries grow in a thin stratum of peat, which however is frequently not more than 6 or 8 inches in depth, and consequently the roots must soon pass through it into the soil below. The finest mass of Rhododendron arboreum I ever saw was within 500 feet of the top of Dodotolia, a hill 10,000 feet high, in Kumaon, between Almorah and Sireenugger, on the Bhaugeruttie river, growing in company with Quercus Kamroopii, and just above the Deodar. Here every possible variety of colour capable of being produced by a mixture of crimson and white was to be found amongst the Rhododendrons; the whole side of the hill was one blaze of colour. A thirst-exciting ascent, in the middle of the day, 23d April, made me search eagerly for water, which I could only find in the shape of some unmelted snow on the north side of the hill in a shady nook, till I descended at least 5000 feet to the stream in the valley below. *William Munro, Capt., Belfast, June* 27.

Voracity of the Pike.—The voracity of the pike is proverbial, but perhaps never has this been more forcibly exemplified than in an instance which has fallen under my immediate notice. A son of Mr. Longhurst, baker, Ascot-heath, while bathing in Inglemoor Pond, in the neighbourhood, was attacked by a pike of very large dimensions. The lad, who is about 12 years of age, had entered the water till it reached his breast, and while in the act of moving his arms, in the attitude of swimming, the right hand and arm were severely bitten by the monster fish, and on the lad extricating the limb it was again seized. Foiled in the second attempt it then attacked the other hand, which was also severely bitten. The youth, after a considerable struggle, beat the fish off, and retreated. I have seen the lad; on the right hand and arm are seven wounds, on the other several. One of the little fingers was completely divided at the point, so much so as to disfigure it much, now the wound is healed. The lad and his companion described the fish as being 2 yards in length, and of proportionate

bulk. As the water in the pond is of no greater depth than 6 feet, this enormous fish might easily be caught. The pond is on the royal property. P.S. Since writing the above, I have heard it asserted, as being the intention of some of the authorities, to endeavour to capture the fish. *George Lovell.*

Paxton's Cottagers' Calendar and English Names.—I have been for some time going to write to you, to hint to Mr. Paxton to add the Latin names as well as the English, in his list of annuals in the "Cottagers' Calendar," as they are certainly known by the former far more generally than by the latter in common parlance. Your discussion about the nomenclature of plants has recalled the matter to my mind. I doubt, indeed, if in many seedsmen's shops they would understand readily what was wanted if I were to ask for "Clammy Eutoca," or "Musk-scented Monkey-flower," or "Garland Poppy Windflower." I am sure I have been puzzled by many of these Anglicised names, and think many dwellers in cottages, and something larger still, would be rather puzzled in the arrangement of their flower garden from this list. I think one most important reason why the Latin names should be retained for plants and flowers, especially when there is such a great intercommunication with foreigners, is that I can chat with Monsieur V. of Paris, Herr K. of Vienna, Mynheer D. of Amsterdam, or Signor G. of Rome about the same plant by the same universally-known name. *Birkhurst.*

Novel Mode of Propagating the Common Ash Tree.—In Midsummer, three years ago, I placed near the stem of the parent tree, and under a branch of it, a few sods. Over the branch were placed other sods. The thickness of the branch was that of my finger, and its length about 2 feet. In October it had a strong root. The branch was then chopped off by a knife, and planted, forming a semicircle with its other end. It has gradually become erect, and is now flourishing, and shooting forth several branches of half a yard long. *G. C. Stephen, Curate of Dalby, Isle of Man, July* 1.

Slough Carnation Show.—As you are always willing to give a hint, allow me to suggest that at the Carnation show at Slough the exhibitors put their names to the flowers after the censors have awarded the prizes. *An Old Amateur, July* 3.

The Way in which Toads Shed their Skins.—I have a postscript to the account I gave at p. 373 of the way in which I witnessed a toad shed its skin. The second specimen in my possession was seen to divest itself of its cuticle two days after the former had performed this feat. I happened to be out of the way myself, but have the account from one of my daughters. Its mode of working about its body or legs was after the manner in which she had seen the former specimen comport itself; but the present example appeared to have no relish for digesting old clothes, for some reason or other it left them as a perquisite for me, who have duly laid them up in spirits for the inspection of the curious. The animal contrived to get rid of more than two-thirds of its worn garments; but there was an obstinate adhesion of one part of its trousers to one of the legs, and this fragment was only removed by my aid two or three days afterwards. It then came off as entire as a glove, with the fingers perfect. I send the account, because it shows how necessary it is to multiply observations before we can arrive at sure conclusions respecting the habits of animals, and the extent to which they may become varied by circumstances. *J. S. Henslow.*

Statice armeria (see p. 373.)—I have often seen it with flowers almost if not altogether white, on the links of Warburton, three miles north-east of Montrose; and I believe a white variety is not considered by botanists to be any great rarity in this quarter. *J. Forman, Kinnaber.*

The Viper.—As the batteries of the electrical eel and the torpedo, as the poison bag of the serpent are for a time exhausted by active use, so the minds of your correspondents seem to have relapsed into quietude after the vehement war which was carried on relative to this subject. In begging a quiet word about it, it is not my intention to risk any assertions on the disputed fact, "whether the young vipers seek refuge from danger in the stomach of their mother;" but bearing in mind the story of the chameleon, let us endeavour to ascertain whether both sides may not be at all events right in part. It is a well known physiological fact that the action of the stomach is excited by the introduction of foreign bodies; that is, from its coat an acrid juice is distilled, which immediately begins to dissolve, or, as we say, to digest such bodies, if they be soluble. But if an animal can live in the stomach, it resists the action of the gastric juice; so will a dead substance that is insoluble, and in such cases the greatest inconvenience results to the owner of the stomach. This gastric juice is so powerful that the living stomach which successfully resists it, is in a few hours after death often corroded and completely eaten through by its own juice. Now, supposing the stomach of the maternal viper to be empty, doubtless, according to this law, a sudden rush of young vipers would be productive of the greatest inconvenience, and a waste of gastric juice, which would certainly end in a fit of indigestion. But suppose the stomach to be full of food, and the serpent tribe are known to eat to repletion—sometimes even leaving a little in their throats till there is room for it down below—how are the young ones to get in? And if they did get in, by turning something else out, what a commotion they would make in the larder running in and out every two minutes. How could nature carry on at necessary and quiet operation—the assimilation of food? She never committed such a blunder as to provide a retreat that was not always, under ordinary circumstances, available. No; for a hundred reasons that are obvious to physiologists the young vipers are not wanted in the stomach—they are to it foreign bodies. But it is said "the young run into the maternal mouth." The testimony on this head is weighty, and may not be disregarded. Does it follow that they go into the stomach? Does the young of the opossum go into the stomach when it scrambles into its mother's pouch? If it does not, it may be at least admitted that it goes very near it. But tell us, cry the impatient, where do the juveniles go to? truths should not be too hastily jumped at. First, catch your viper. If the young ones have just run in, so much the better. Then ascertain whether there are not near the throat two other openings which lead into one sack, provided for the purpose, and into which they can go to avoid danger, without insulting nature, or asking the old viper to breathe into its stomach for their special accommodation. If, therefore, a dissection, conducted it may be at the proper period, shall establish this view, then will all mystery be cleared away, which would not be the case if they were proved to go into the stomach, for many questions would in that case arise infinitely more difficult to solve than the one under consideration. *Henry Chaytor, Croft, June 7.*

Rosa Manettii.—Absence from home has prevented me from replying earlier to Mr. Rivers's strictures on my remarks on the Manettii stock. I can only now say that I discover no reason to change my opinion. His great experience I admit, and I believe that no practical horticulturist of the age has done more to advance the interests of gardening. On the other hand, if I am unfortunate in being young, it is a misfortune I cannot help; and I do not claim more credit for my opinions than they are entitled to. The Manettii stock has, however, had five or six years' fair and unprejudiced trial here, and my first letter contained an honest—if a mistaken—opinion of its merits. I was about to say more in support of it, but my eye has, for the first time, caught sight of the sensible and truthful letter of Mr. John Saul, which also appeared in the *Chronicle* of the 8th of June. To this letter I in preference refer. There are facts and reasons there evidently the result of observation and study, which those who have not seen may do well to look at, and those who have may be repaid by a second perusal. To the next point. "Rosa Manettii" is unfortunate in his autobiography. A charge of egotism is the least serious charge I have to bring against him. The warm imagination engendered by his "charming waters and sunny skies" appears to have led him far astray even in "foggy England." When I hear him say of the poor soil of Cheshunt—a soil dry, harsh, and almost destitute of vegetable matter—"I found the soil very rich," "I did not want so rich a soil," what answer can I give? As I look upon his sharp broad thorns, and hear him again state, "If ever you wish to bud me, I will not prick your fingers," I can only reply, "Oh! Signor, I dare not trust you. I judge by acts and not by words."

"However fair he seems to be,
Take care,
Lest what he says should not be true,
Beware!
Trust him not,
He is fooling thee." *W. Paul.*

The Cuckoo.—About a month ago I heard, and mentioned as a curious circumstance, the peculiar variety in the cuckoo's note, described by your correspondent "Este." The bird was flying before me, and alighting on trees and hedges, and each time it was still uttering its new cry; the effect of which was as if an echo were repeating the last note; thus cuck-koo-koo. *Brecon, June* 26.——I heard the cuckoo in several different places yesterday (June 26), but I did not perceive any change in its note. During the whole of the season of its singing its note is occasionally cŭck-cŭck-koo, and sometimes merely cŭck, especially when taken by surprise, or chased by a magpie or a hawk. *R. M., near Derby.*——The change of note in the cuckoo is so common in Gloucestershire that there is a nursery rhyme to that purport:

"The cuckoo comes in April,
Sings a song in May;
Then in June another tune,
And then he flies away."—ELMESTREE.

——The change of the usual note to cuck-cuck has been repeatedly noticed by myself and others in this county (Norfolk), and a friend who remarked the same circumstance in Surrey, assures me that it is by no means an uncommon occurrence for these birds, late in the season, to repeat the first syllable several times in succession, leaving the usual note unfinished. *O. C. S.*

——The Cuckoo altered his note here a fortnight ago or more to cŭc-cŭc-kōō, and sometimes cŭckōō-ăh. *M. B., Canterbury, July* 3.

Can Grapes be Profitably Cultivated in Pots?—I had a few eyes of Hamburgh and Welbeck Black Tripoli, which I put into pots in the first week of March, 1849; they rooted in three weeks, and were potted off singly. At the end of 28 days, when they had made four leaves, they were pinched off at the top, the lateral that was afterwards produced forming the fruiting plant. The 12 plants were kept in a strong moist heat of from 70° to 90°; they were twice shifted during their summer growth, and by the end of September they had each made 17 feet of wood. They were then removed to a south wall; very little water was given them, and on the 1st of January, 1850, they were put into a pit heated by hot water. They broke regularly from the pot to the top of the plant, many of the eyes showing two bunches of fruit, and some of the plants had 30 bunches on them, but these were reduced to seven bunches to each plant. They ripened perfectly, and I commenced cutting on the 12th of May. When the fruit was removed, the plants were liberally supplied with strong manure water, and they are now in a fair way to bear a good crop next season. *River Head, Louth, Lincolnshire.*

Ancient Timber Felling.—You asked me if I could give you any clue to old records of the time of felling timber, in this country, four or five centuries ago. A few days since I lighted upon a paper of Professor de Morgan's, in the "Companion to the British Almanack for 1846" (pp. 1 to 31), in which the following is quoted, amongst other lines, from an old Almanack of 1518:

"NOVEMBER.—Pingues ditibus anseres November
Vendo, et ligna seco favente lunâ."

Now, as "favente lunâ," if it alludes to the idea of timber keeping best when felled at a particular time of the moon, must refer to building, not burning timber, I imagine the above extract refers to timber for building purposes. Moreover, the verse may be taken to give the practice of the century preceding the date of publication, so that to a certain extent it answers your question. "Favente lunâ" can hardly mean by moonlight, which is the only other interpretation that occurs to me. *J. R.*

Remedy for the Sting of a Bee.—Spirits of wine are stated to be a remedy for the sting of a bee. A handful of common garden earth, rather moist, applied immediately over the sting, like a poultice, and kept in its position by a handkerchief tied round the part, is an equally efficacious cure. If necessary, the earth may be renewed, when it becomes dry, but the first application generally removes all pain. This remedy I have frequently tried with my own children, and always with entire success. *O. C. S., Norfolk.*

The Gardeners' Benevolent Institution was founded for the relief of aged and indigent gardeners, and such is poor old Beach, who was elected a pensioner on its funds a few days ago. It is now about 65 years since he was apprenticed to a leading gardener of the day, and he has followed the business all his life. The last few years he has been unable to work, through the many infirmities consequent on old age. I regret that he did not subscribe to the institution; but in the days of his prosperity it did not exist, and, until the last few years, the Gardeners' Benevolent Institution was not extensively known to the gardeners of this country. Beach is now 80 years old; his poor wife was ill 15 years; the little money he saved was unfortunately lost; his character has always been very good, and I feel convinced that of the 358 votes which were polled in his favour, he would have had every one of them had the persons who gave them been acquainted with him. True he never has subscribed one farthing to the funds of the charity, but is he to be left to starve or go to the parish? A man who has borne the burden and heat of the day—who has weathered the storms of 80 winters. Placing such a man on the funds of the institution will not tend to ruin the charity, but to promote its interests. I agree with you that the subscribers to the institution should in general vote for candidates who have subscribed to its funds, but this should not be compulsory; we give our money, not to a benefit club, but to a benevolent institution, and we should have the privilege of voting for whom we choose. Place on the list of pensioners, without election, the man who happens to have subscribed longest to the funds (be his character good or bad), and you have signed the death-warrant of the institution—its downfal is speedy and certain. What aged gardener who perhaps hopes in a few years to enjoy his pension of 16*l.* a year, would then commence subscribing? It would immediately occur to him that those who had commenced subscribing previously would have the prize, and he would have no chance; perhaps he has been more steady than they, has served longer and in better situations, has a better character, but all to no purpose—they happened to begin sending up their annual guineas a few years before him—they are elected—he must live on his relations if he has any, or go to the parish if he has none. No, the interests of the charity would be served in a far greater degree if the committee were to put down the very expensive process of sending circulars (begging letters I may say) to each subscriber, praying for votes. Whoever would get in, under the present system, must do it. The poor fellow who has five or ten pounds must spend them in printing, advertising, and postage, to get elected. If he is destitute he has no chance, unless he can get his friends to assist him. If the committee would be extremely particular to ascertain all particulars of the character and, as much as possible, the life of the applicant, before they admit him a candidate, and from these full particulars, if Mr. Cutler would draw up an account of the man in the voting papers (far more voluminous than he does at present), stating where he has lived, how many years in each place, and many other particulars, so that the person voting could form a pretty accurate estimate of the man's character for whom he was voting, and then not allow any one to send circulars; this I think would tend to make the institution more prosperous than it even is at present, and the worthy candidate, though very poor, would stand an equal chance with the man who had a few pounds to fight the battle with. The Gardeners' Benevolent Institution is thriving now, and I hope—I sincerely hope—it will continue to do so. What I can do for it, what little influence I may possess, I will use for its benefit, and although I may, in conjunction with Messrs. Garraway and Co., of Bristol, "have achieved an unenviable success" by assisting by our votes and exertions to place Beach (a non-subscriber) on the pension list, I conscientiously believe that if you search the list of subscribers through, you will not find a more upright worthy old man, nor one more grateful to the subscribers and friends of the institution, who have kindly placed him a pensioner on their bounty. *J. C. Wheeler, Kingsholm Nursery, Gloucester.*

Societies.

ROYAL BOTANIC, REGENT'S PARK, *July* 3.—A large number of Pelargoniums, a good display of Orchids, many well-cultivated stove and greenhouse plants, good collections of Cape Heaths, and some Cacti were assembled on this occasion, and there was an extensive exhibition of fruit.

In collections of 30 STOVE and GREENHOUSE PLANTS, the first prize was this time awarded to Mr. Cole, gr. to H. Colyer, Esq., of Dartford, for beautiful plants of Allamanda cathartica, Schottii, and grandiflora; Dipladenia splendens and crassinoda, four well-managed Cape Heaths, Cyrtoceras reflexum, Rondeletia speciosa, Æschynanthus fulgens, with four flower-spikes; four Everlastings, two Vincas, Crowea saligna, Franciscea angusta, Sphenotoma gracilis, Ixora coccinea, beautifully grown and flowered; Leschenaultia formosa, a spreading Polygala cordifolia, Kalosanthes coccinea, Ixora crocata, Epacris miniata, and two Clerodendrons. Mrs. Lawrence's group, which was second, contained Allamanda cathartica, Schottii and grandiflora; two very fine plants of Stephanotis floribunda, Pavetta caffra, insufficiently in bloom; two capital

specimens of Sollya linearis, a large Burchellia capensis, three Cape Heaths, Ixora coccinea, and a splendidly flowered I. javanica, Pimelea decussata, Phænocoma proliferum, two Vincas, Franciscea acuminata and angusta, Crowea saligna, Aphelexia macrantha. Kalosanthes versicolor, a small Gardoquia Hookeri, Sphenotoma gracilis, a Clerodendron, and one or two plants of less importance. Another collection of 30 was supplied by Mr. Stanly, gr. to H. Berens, Esq., but among these we did not observe anything remarkable.

In the collections of 20 Stove and Greenhouse Plants, Mr. Green, gr. to Sir E. Antrobus, Bart., was first. His group contained good examples of Stephanotis floribunda, Allamanda cathartica, Metrosideros floribundus, Erica Massoni, Æschynanthus pulcher, Ixora coccinea, Pieroma elegans, not nearly at its best as regards bloom; and Echites atropurpurea.—Mr. Taylor, gr. to J. Coster, Esq., was second, with Phænocoma proliferum, Dipladenia crassinoda, Ixora coccinea, Allamanda Schottii and cathartica, in good condition; the charming Erica metulæflora bicolor, a small Tristania neriifolia, Azalea Gledstanesi, a variety of Kalosanthes coccinea, an Everlasting, Cyrtoceras reflexum, Erica Cavendishii, and Sphenotoma gracilis.

Various groups of 10 Stove and Greenhouse Plants were produced. A first prize was awarded to Mr. Williams, gr. to Miss Traill, of Bromley, for Allamanda Schottii, Ixora coccinea, Phænocoma proliferum, the blue Leschenaultia and L. formosa, Pimelea Hendersoni and decussata, Rondeletia speciosa, Polygala cordifolia, and the larger variety of Kalosanthes coccinea.—Second, Mr. Croxford, who had good plants of Phænocoma proliferum and Kalosanthes coccinea.—Perhaps the best of Mr. Laybank's plants were Pimelea decussata, Gompholobium splendens, Leschenaultia formosa, Allamanda cathartica, Boronia serrulata, an Everlasting, Erica depressa, and Posoqueria versicolor.—Mr. Speed, who was fourth, had fair examples of Allamanda cathartica, Schubertia graveolens, Dipladenia crassinoda, and Chironia glutinosa.

Orchids were, as usual, arranged on one side of a long tent, behind the Pelargoniums, and had a good effect. In collections of 25 plants Mr. Mylam, gr. to S. Rucker, Esq., was first. His plants consisted of Aerides quinquevulnera, insufficiently advanced in bloom; a large A. odoratum, and A. maculosum, Cymbidium pendulum, Maxillaria tenuifolia, the large flowered Phalænopsis, Cycnoches ventricosum and Egertonianum, but not on the same plant, as sometimes happens; Epidendrum alatum, vitellinum, and verrucosum; the charming Saccolabium Blumei and S. guttatum, Lælia majalis, with two flowers; a pretty well-flowered Sobralia macrantha, Odontoglossum Karwinskii, Vanda Batemanni, Oncidium Lawrenceanum, the curious Cirrhæa fusco-lutea, Angulоa uniflora, with some 13 ivory white blossoms all open at once; Lycaste tetragona, the bearded Lady's Slipper, and Brassia Lawrenceanum. Mr. Williams, gr. to C. B. Warner, Esq., of Hoddesdon, was second. This group comprised two fine plants of Aerides odoratum, and its purple variety; also A. maculosum, affine, and roseum; Dendrobium moschatum, densiflorum, and secundum; Oncidium pulvinatum, Epidendrum verrucosum, Saccolabium guttatum, Brassia Wrayæ and Lanceanum, the bearded Lady's Slipper, Broughtonia sanguinea, the larger flowered Butterfly plant, and a well bloomed Barkeria spectabilis, a plant that few manage well.

In collections of 15 Orchids the first prize was awarded to Mr. Blake, gr. to J. H. Schröder, Esq., for Galeandra Baueri, Oncidium pulvinatum, Phalænopsis grandiflora, a large Aerides odoratum, Calanthe masuca, with three spikes of purplish lilac flowers; Cattleya Mossiæ, Vanda teres, the rare white blossomed Burlingtonia venusta, Angræcum caudatum, Dendrobium chrysanthum, a pale variety of Acineta Humboldti, Trichopilia tortilis, and Vanda tricolor.—In Messrs. Rollisson's group of 15 we remarked a variety of Stanhopea maculata, also S. tigrina, Cattleya Mossiæ, and the beautiful C. Harrisoniæ, the curious long green-tailed Dendrochilum filiforme, Oncidium Lanceanum and pulvinatum, the large-flowered variety of Phalænopsis, Broughtonia sanguinea, Aerides quinquevulnera, a finely blossomed specimen of Miltonia spectabilis, Calanthe veratrifolia, the scarce yellow-flowered Peristeria cerina, and Burlingtonia venusta.

Collections of 10 Orchids were contributed by Mr. Barnes, gr. to H. Hanbury, Esq., and Mr. Dobson, gr. to Mr. Beck.—Mr. Barnes sent Oncidium pulvinatum, Aerides affine and odoratum, Stanhopea tigrina, Angræcum caudatum, Brassia Wrayæ, the large flowered Phalænopsis, Barkeria melanocaulon, Saccolabium Blumei, and a good Oncidium Lanceanum.—Mr. Beck's plants consisted of the larger variety of Oncidium amphatum, O. luridum, and Harrisoniæ, Dendrobium secundum, finely coloured; Cattleya Mossiæ, Epidendrum vitellinum, calochilum, and phœniceum; Aerides odoratum, and Galeandra Baueri.—Mr. Mylam sent a handsome Cypripedium, apparently a variety of C. barbatum; Mr. Loddiges Saccolabium Blumei, and Aerides suavissimum.—Mr. Barnes had the rose-coloured Phalænopsis.

Cape Heaths, in collections of 15.—Mr. Smith, gr. to J. Quilter, Esq., of Norwood, was first with good plants of ventricosa grandiflora and v. magnifica, the large variety of jubata, Shannoni, a large plant of tricolor, retorta major, large and fine; metulæflora, a large Cavendishii, tricolor elegans, t. rosea, and t. Leeana, Massoni, ampullacea, Bergiana, a pretty Heath covered with small round purple bells, and a variety of obbata.—Mr. Rucker's collection was placed second. It consisted of obbata (Veitch's), a charming kind; the larger variety of tricolor, t. splendens, t. speciosa, and t. Dunbariana, Cavendishii, ventricosa Bothwelliana, Parmentieri rosea, inflata, retorta major, eximia, and Vernoni.—Among Nurserymen the first prize was awarded to Mr. Epps, in whose group were good examples of Wilsonii, tricolor Leeana, t. superba, t. Jacksoni, Shannoni, and Cavendishii; second, to Messrs. Rollisson, for metulæflora bicolor, a variety of ferruginea, mutabilis, two varieties of ampullacea, Savileana, a small flowered profuse blooming Heath, jubata multiflora, and viridiflora. A collection of 12 was also furnished by Messrs. Pamplin.—In six plants the first prize was awarded to Mr. Williams, gr. to Miss Traill, for Lee's tricolor, ventricosa superba, Shannoni, Cavendishii, jasminiflora alba, and Clusiana; second, Mr. May, gr. to E. Goodhart, Esq., for tricolor elegans, viridiflora, jasminiflora alba, princeps, and Cavendishii. One or two other collections were produced, but they were inferior to those we have just mentioned.

Among Single Specimens the best were large and beautiful plants of Stephanotis floribunda from Mr. May, gr. to Mrs. Lawrence, and Leschenaultia formosa from Mr. Williams, gr. to Miss Traill. Mr. Dennett had also a nice Kalosanthes coccinea; Mr. Kinghorn Leschenaultia arcuata, a singular looking species, and there were one or two other good plants shown under this head.

In New Plants the first prize was given to a very fine specimen of Ixora javanica from Mrs. Lawrence's garden at Ealing Park, and equal prizes to Ipomœa limbata, a pretty species, purple margined with white, from Messrs. Rollisson; Begonia cinnabarina, from Messrs. Henderson; Hemiandra pungens; a lilac flowered greenhouse plant from Mr. Henderson, St. John's Wood, and Magnolia fragrantissima and Thyrsacanthus bracteolatus from Messrs. Rollisson.

Pelargoniums, as we have already stated, were plentiful, and in good condition. Twelve new varieties, Amateurs, equal prizes to Mr. Cock and Mr. Stains. The former had Princess, Pictum, Centurion, Paragon, Avenger, Salamander, Victory, Pearl, Lalla Rookh, Firebrand, Mars, and Rosamond. Mr. Stains sent Clarinda, Gipsy Bride, Constance, Armada, Princess, Forget-me-Not, Ariel, Lamartine, Orion, Bertha, Victory, and Painted Lady; 2d, to Mr. Robinson, for Paragon, Senator, Rowena, Black Prince, Forget-me-Not, Zenobia, Titus, Medus, Salamander, Rosetta, Cassandra, and Mars. Nurserymen: 1st, to Mr. Dobson, gr. to Mr. Beck, for Hilax, Mont Blanc, Diana, Promise, Cassandra, Seedling, Painter, Vanguard, Exhibitor, Sarah, Rosalind, and Cuyp; 2d, to Mr. Gaines, for Negress, Star, Duchess of Cleveland, Nobilissimum, Salamander, Mars, Sylvia, Grandiflorum, and Field Marshal; 3d, to Mr. Bragg, Slough, for Star, Magnet, Orion, Ondine, Conspicuum, Lady Somerville, Norah, Marian, Alderman, Azure, Ariel, and Lord Gough. Six varieties: 1st, to Mr. Parker, gr. to J. H. Oughton, Esq., for Ackbar, Dorcas, Centurion, Forget-me-Not, Emperor, and Pearl. "Fancies:" 1st, to Mr. Robinson, for Madam Miellez, Ibrahim Pacha, Queen superb, Anais, Defiance, and Reine de Francais; 2d, to Mr. Stains, for Fairy Queen, Bouquet tout fait, Queen superb, Kate, Medusa, Reine de Francais. Mr. Gaines had Wintonia, Lady St. Germains, Queen superb, Orestes, Virgil, and Hero of Surrey. "Capes:" 1st, to Mr. Stains, for Ardens major, bicolor, quinquevulnerum, Blandfordianum, bipinnatifidum, Ardens, and bicolor roseum; 2d, to Mr. Parker, for fulgidum, glaucum, Blandfordianum, erectum, tetragonum, flexuosum, glaucifolium, and reniforme. A collection of Cape Pelargoniums was also produced by Mr. Henderson, of St. John's-wood.

Calceolarias: The best came from Messrs. Henderson, of Pine-apple-place. They consisted of Falconridge, Nell Gwynne, Laura, elegans, Black Agnes, and Catherine Seaton.

Cut Roses were exhibited in large quantities; they filled one side of a long tent. Collections of 100 each were sent by Messrs. Lane, Paul, and Francis, and boxes of 50 by Messrs. Barnes, Terry, Parsons, and Rowland. In general, they maintained their condition well throughout the day, and proved one of the most important features of the show. Some new Roses were produced; but these we expect to see again, and under more advantageous circumstances.

Among Fuchsias, Gloxinias, and Verbenas we did not remark much novelty; among the latter we, however, observed a very large blue variety called Mrs. Mills, from Mr. Turner, of Slough; and good examples of well-known flowers were not wanting in the other classes.

Pinks were numerous and large, but dull in colour, it being late in the season for them. The 1st prize was awarded to Mr. C. Turner, Royal Nursery, Slough, for Whipper-in (Smith), Great Britain (Ward), Diana (Smith), George Glenny (Bragg), Lola Montes (Costar), Narborough Buck (Maclean), Criterion (Maclean), Sappho (Turner), Queen of England (Hale), Huntsman (Smith), Dr. Daubeny (Kirtland), and Lord Valentia (Kirtland); 2d, to Mr. Bragg, of Slough. Certificates of Merit to J. Edwards, Esq., Holloway, and Mr. Keynes, of Salisbury.

Picotees.—1st prize to Mr. C. Turner, for Mary (Dodwell), Constance (May), Marris's Seedling Mary (Parkinson), Sylph (Headley), Heroine (Yonell), Ne Plus Ultra (Matthews), Juno (Matthews), General Jackson (Burroughes), Beauty (Shaw), Prince Albert (Crask), and Duchess of Sutherland (Burroughes); 2d, to Mr. Newhall, Woolwich.

Carnations.—1st, to Mr. Willmer, Sunbury; 2d, to Mr. Newhall, Woolwich.

Pansies were shown, and two prizes awarded, but in July there is neither beauty nor interest attached to them.

Seedling Florists' Flowers.—Pinks: Sappho (12 blooms), shown by Mr. Turner, was very evenly laced, smooth on the edges, good size, and, we should say, a constant variety, from the number of blooms which have been shown of it. Huntsman, by the same grower, very smooth stout petal, laced with rosy purple; both had Certificates.—Picotees: Dodwell's Mary, light red edge; large fine variety, of good substance. Fellowes's Prince Arthur, medium purple edge, good white, full flower, without bars or spots of any kind.—In Carnations there was a very good rose flake called May's Romeo. There was a large display of seedling fancy Pelargoniums of various degrees of merit, but great sameness pervaded the majority of them. The judges did not risk an opinion by selecting any for Certificates. A pretty light seedling Fuchsia, named Bank's Expansion, possessed fair properties, being of good habit, stout, and having the colours strongly contrasted.

The Fruit consisted of 36 Pine-apples, more than 50 dishes of Grapes, upwards of 40 ditto of Peaches and Nectarines, and several exhibitions of Melons, Strawberries, and other fruits. A miscellaneous collection was produced by Mr. Fleming, gr. to the Duke of Sutherland, at Trentham. It contained a good Providence Pine-apple, Noblesse Peaches, May Duke Cherries, a dish of Grapes, and another of Figs. The best six Pine-apples were furnished by Mr. Bray, gr. to E. Lousada, Esq., and a similar group was contributed by Mr. M'Ewen, gr. to the Duke of Norfolk, at Arundel. Mr. Jackson, gr. to H. Beaufoy, Esq., sent a Trinidad Pine, a perfect pyramid upwards of a foot in height. A Providence, weighing 7 lbs. 8 oz., was contributed by Mr. Fleming. Ripley Queens, beautifully swelled and ripened, were exhibited by Mrs. Bailey, of Belgrave-square, and good fruit of the same variety of Pine-apple were produced by Mr. Drummond and Mr. Spencer. Grapes: Muscats were generally unripe; but there were some good Black Hamburghs, and one or two excellent bunches of West's St. Peter's. The best three dishes came from Mr. Smith, Dulwich; these were Black Hamburghs, Black Prince, and Muscadine. The best dishes of "12 lbs." came from Mr. Henderson, gr. to Sir George Beaumont, Bart., and Mr. Venibles, gr. to G. Solomon, Esq., Peckham Rye, the sort in both cases being Black Hamburgh. The best single dish of three bunches came from Mr. Holmes, gr. to E. Garrod, Esq., Putney Heath. The best dish of Muscat of Alexandria was communicated by Mr. M'Intosh; the next best by Mr. Kemp, gr. to Mrs. Grillion, East Acton; and Mr. Turnbull took a third prize with a dish of good Cannon Hall Muscats. For White Frontignans, the first prize was won by Mr. Moffat; Mr. Taylor and Mr. Bain took second prizes for some well-grown White Muscadines. Mr. Henderson was awarded a first prize for excellent Red Frontignans. Peaches and Nectarines: For the best four dishes, the first prize was won by Mr. Turnbull; the second by Mr. Parker, gr. to J. H. Oughton, Esq., and Mr. Foggo, gr. to the Marquis of Abercorn, Stanmore Priory (equal); third prizes were taken by Mr. Munro, gr. to Lord Clarendon, and Mr. Slowe. Mr. M'Intosh was first for the best two dishes. Cherries: Mr. Snow, gr. to Earl de Grey, had some beautiful Guignes, for which the first prize was awarded. Strawberries: In this class the successful competitors were Mr. Lydiard (1st), market gardener, Bath; and Mr. Kimberly, Coventry. Melons: The first prize, for a green-fleshed variety, was taken by Mr. Barnes, gr. to H. Hanbury, Esq.; Mr. Spencer, and Mr. Watson, gr. to Mrs. Tradwell, Norwood, were equal second; while a certificate of merit was awarded to Mr. Gerrie, gr. to Sir John Cathcart, Bart., and also to Mr. Monro, gr. to Mrs. Oddie, Colney Hatch. The best scarlet-fleshed sort was produced by Mr. Weir, gr. to J. Hodgson, Esq. Of Tropical Fruits, Mr. Ivison, gr. to the Duchess Dowager of Northumberland, Syon House, sent specimens of Vanilla, Carica Papaya, Miristica moschata, Xanthochymus pictorius, and Physalis peruvianus. Mr. Williams, gr. to J. Lenhouse, Esq., Maryport, sent some large fruit of Stephanotis floribunda, and Mr. Bray had a collection of Citrons.

Slough Pink Show, *July* 1.—At this meeting flowers were not abundant; the best examples were Whipper-in, Narborough Buck, Diana, Lola Montez (fine), Harriett, Alfred Morison, Criterion, Goliah, and a seedling by Turner named "Sappho." Some Pansies were exhibited by Mr. Hunt, but they were somewhat out of character.

Reviews.

Moore's Handbook to the Botanic Garden of the Royal Dublin Society, Glasnevin (Dublin, 12mo), is a useful account of this important institution, by its present curator. We scarcely need say that the Garden of Glasnevin is one of the most worth seeing of all the objects to be examined by the visitor to Dublin.

The Finchley Manual of Industry. No. II. Gardening (18mo, London).—The plan of this little book is better than its execution. Cottagers' children are to be taught practical knowledge, instead of the useless stuff with which it is the custom to cram country lads. Nothing can be better in principle. They are to be taught by the system of question and answer. The plan is still good. The matter taught must be plain, simple, and of daily application. Still quite right. But the information, however plain and simple, must be strictly true; otherwise teaching does more harm than good, and here we complain of the author of the "Finchley Manual." Surely, he can hardly mean that such a paragraph as this is fit for children (of any age): "*Q.* What is a tuber? *A.* A sort of round swelled *root*, or knob, like one of the *roots* of a Potato, &c.; and plants producing such *roots* are termed tuberous.—*Q.* How many tubers, or *under-ground stems*, are reckoned, &c. *A.* Omitting the Salsafy, the Scorzonera, and the Skirret, which are now only cultivated on the Continent and in gentlemen's gardens, their number is nine, and they are mostly mentioned as roots: the Potato, Turnip, Carrot, Parsnip, Beet, Radish, Jerusalem Artichoke, Horseradish, and Hamburgh Parsley." We must really protest against this sort of teaching (!) The child is first told that a tuber is a "sort of root," which it is not; then he is informed that it is an "under-ground stem," which is true; and, finally, he is taught that 12 common esculents are tubers, which is false, almost all of them being true roots. To what advantage confusion like this is expected to lead we must confess our inability to comprehend.

Frazer's Hand-book for Ireland (2d edition, Dublin), will be found to be a useful road book to tourists, for whom it is chiefly intended, and gazetteer for those whose pursuits lead them to inquire into Irish localities without visiting them. In the Appendix is a short memorandum by Dr. Mackay, concerning Irish botany; but we would suggest to the intelligent editor of the work that he would do well, in a future edition, to make natural history a conspicuous feature, and to introduce it into the body of his book. Many a tourist would be glad to know what rare plants, insects, &c., are to be found in the place he passes through, and what are its mineral and geological features.

The *late Professor Kunth's Enumeratio Plantarum* has reached a fifth volume. It contains an account of *Asparagineæ, Smilacineæ, Lapagerieæ, Roxburghiaceæ, Herreriеæ, Ophiopogoneæ, Aspidistreæ, Dioscorineæ, Taccaceæ*, and *Amaryllideæ*; a set of names which we recommend to the consideration of those gentlemen who think that technical natural history can be made acceptable to the mass of the community. The volume contains 908 pages.

Garden Memoranda.

Royal Botanic Gardens, Kew.—The object of greatest attraction here at present is the Victoria Regia, which has been in flower for more than a fortnight past, and it promises to keep on blooming for some time yet to come. When we saw it, about 6 o'clock on Monday last, one blossom bud was just beginning to open, and there was another beside it in a less forward condition. A low span roofed stove, stated to have been formerly an Orchid house, has been converted into a tropical aquarium, for the accommodation of the Victoria, and some other stove aquatics. The centre of a large square slate tank is occupied by this splendid inhabitant of the waters; and round the sides and ends are red, blue, and white Water-Lilies, Euryale ferox, the slender Grass-like Vallisneria spiralis, and examples in flower of that beautiful water plant of the East Indies, Nelumbium speciosum. The leaves of the Victoria are small, the largest measuring only about 3½ feet in diameter, and they all want the finely turned-up rim, and healthy rich green colour of the magnificent foliage of the plants at Syon or Chatsworth. The tank in which it grows is supplied, we believe, with Thames water, which keeps flowing continuously into it from a small pipe near its side, and passing off by a waste pipe in another quarter. Before the Thames water was led on, the plant did not thrive; and its not blossoming sooner here than it has done is attributed, in the "Guide to the Gardens," to the water in which it was at first placed being unsuitable for its healthy development. One of the Coccolobas (C. macrophylla) is in flower in the large Palm-stove, and is really very handsome. The spike of flowers is upwards of 2 feet in length, bright crimson, and, when looked at against the massive foliage of the rich tropical vegetation which the house everywhere contains, has a striking effect. The height of the plant and flower-spike together could not be less than from 10 to 12 feet.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Discontinue stopping the shoots of Vincas, Euphorbias, Poinsettias, Gesneras, Eranthemums, and other plants of similar habits, which are designed for autumn or winter flowering; and attend duly to potting, watering, and regulating the heat and moisture. Light and air are indispensable for the ripening of the shoots of

these, and of other plants grown for the same purpose. Amongst these, one of the most useful is the Linum trigynum, which produces large clear yellow flowers in great abundance during the winter. As the tender kinds of greenhouse plants complete their growth, they may be set by themselves in houses or frames, of which the sashes can be easily put on or removed. In such a situation they can be freely exposed to the sun and air, but at the same time may be covered when the weather is excessively wet. In staging the plants, they should be so arranged that they shall shade only the pots of those which are behind them. The hardier kinds of greenhouse plants may be set in the open air, without any kind of shading. It is a great mistake to place established plants behind a north wall, during any portion of the summer, as if they were taking their season of repose; but, on the other hand, it is essential that the pots be protected from the sun. When the plants are necessarily put out of doors during this season, they should be plunged in beds of sifted coal-ashes; but take care to place them far enough apart to ensure a free circulation of air amongst them. The training of conservatory climbers should be regularly attend to, avoiding looseness or negligence, but still leaving them to hang in graceful festoons from the roof. Maintain the plants in a healthy vigorous state by occasional waterings with liquid manure, as it is important by every possible means to provide an extensive in-doors display of floral beauty for the late autumn months, in some measure to compensate for the sudden prostration which will then take place in the open garden. Use the syringe more sparingly, except in very fine weather, and at all times apply it early enough in the day to allow the superabundant moisture to pass off before night. Propagate choice Calceolarias, Cinerarias, &c., by cuttings or offsets from the old plants, taking care that they are free from the green-fly or other insects. Make another sowing of Chinese Primulas to flower in small pots.

FORCING DEPARTMENT.

PINERIES.—Having selected, to meet the demand in winter and early spring, those plants which are now showing or flowering, and those which shortly promise to follow their example, a portion of the strongest and best rooted of those remaining should be picked out to succeed them; these should be potted immediately if they require it, and grown on steadily, without any check; any of the smaller plants which are in immediate need of potting, should also be attended to. Keep up an uninterrupted succession, by planting a few suckers occasionally in a brisk bottom-heat. Where the planting out system is practised, there is no difficulty in keeping up the succession if all vacancies are filled up as they occur with the best plants selected from among the succession. VINERIES.—As the Black Hamburgh Grape is so liable to shrivel after it is ripened, and as it is thereby deteriorated in quality, it is advisable to shade them during very hot sunshine. Where the crops are swelling let the state of the borders be frequently examined, especially of those which are covered with tarpauling or other material. If the soil is dry let the surface be carefully loosened with a fork, and watered with liquid manure. Examine the bunches of swelling crops, thin crowded clusters, and remove any small berries, which will only spoil the sample if they are allowed to remain. PEACH HOUSES.—Admit a free circulation of air through all the houses during fine weather; but where the fruit is just ripening, ventilating during the night and in damp weather should be effected by means of the front, keeping the top sashes closed to prevent damp cold dews from setting on the fruit. The foliage in the early houses should be kept in a healthy state as long as possible by syringing, and guarding against insect depredators.

FLOWER GARDEN AND SHRUBBERIES.

Remove suckers from Rose trees, and stop all gross shoots on the summer flowering kinds. Employ mulching as a means of protecting the soil from evaporation during summer, and especially round standard Roses and other choice shrubs, whose leaves afford little or no shade. Leaf-mould, thoroughly rotted dung, or short Grass, are well adapted as materials for this purpose, particularly the two former, as the soluble ingredients contained therein will be washed downwards in showery weather. After finishing the propagation of Pinks and Carnations, by pipings and layers, proceed with other hardy herbaceous plants, as Phloxes, Pansies, Wallflowers, Antirrhinums, Pentstemons, &c., all which will strike under handlights with the greatest freedom; or even without such assistance, if a shady situation is chosen, and watering is carefully attended to. It is of the first importance to propagate these plants as soon as possible, as time is thereby gained to allow of their being pricked out into nursery beds, where they soon become thoroughly established, and are enabled to endure the winter with very slight protection. The old Linum flavum makes a good yellow bed, continues in flower all the summer, and is perfectly hardy; it will strike freely if the cuttings are taken before the wood gets too hard. Sow Brompton and Queen Stocks for spring flowering, and Intermediate Stocks for autumn. A sowing may also be made, for late autumn flowering, of some of the hardier annuals, which come very quickly into a flowering state. Very much may be done towards stimulating the growth of weakly plants, and assisting the flowering of healthier ones by frequent waterings of liquid manure. It is an expeditious and immediately effective mode of increasing the fertility of the soil. Perhaps the flower-garden does not possess more beautiful ornaments during early summer than the Ayrshire and Evergreen Roses, worked high on standards, with their branches allowed to hang down as Nature dictates. This will be a hint to those who are budding Roses, to select some of the tallest stocks for this purpose; or, if none of their stocks are tall enough for this season's work, some of the strongest should be left unbudded, so that by pruning and liberal treatment, sufficiently high stems may be secured against the proper time next year.

FLORISTS' FLOWERS.

PINKS.—These may be piped, or struck from cuttings, as soon as possible. Some florists layer the larger shoots, but these make by no means so handsome plants as by the former method. We know some people who are unsuccessful in what is really a very simple operation. The best plan is to make an excavation a foot deep, in a shady situation; in this place a bass mat, which should be larger than the bed, that it may turn up at the ends and sides; this will prevent the worms getting amongst the compost and loosening the cuttings. The excavation may then be filled up, level with the surrounding surface, with some well-prepared vegetable soil and river sand; it will then be advisable to give it a soak of water, when it will be ready for the pipings. TULIPS.—The sooner these bulbs are out of the ground the better, when the foliage has assumed a yellow tint; the skin of the bulb will be brighter, and we have often found that bulbs, which had been left in the ground till the skin was black, were the succeeding season coarse and out of character. AURICULAS.—Do not lose sight of these favourites; take care that they are properly watered and kept free from green-fly. It ought not to be "out of sight out of mind." RANUNCULUSES.—Get them up as the foliage withers. DAHLIAS.—Thin, disbud, tie out, and entrap earwigs.

KITCHEN GARDEN.

If Asparagus beds are plentifully supplied now, and during the next month, with liquid manure from the farm-yard, or soap-suds from the laundry tank, with common salt added, it will effect wonders in the way of improving the size and quantity of next year's crop. Asparagus seedlings should be thinned; and the ground kept in a loose state about the young plants. Water these also with rich water, with salt added. It is wonderful how rapidly these will advance now, if well attended to. Sow Early York Cabbages for transplanting thick, to draw as Coleworts for autumn use; taking care to adopt effectual means of protecting the seeds from the depredations of birds. Sow also a bed of parsley, for late autumn and early winter use, upon ground which has received a rich dressing of soot and well-rotted manure. Let no pains be spared to obtain a good stock of material for Mushroom beds, to succeed the open fields in supplying this delicacy. Horse droppings are to be preferred for this purpose; but if a sufficient quantity of these is not procurable, the excrements of sheep or deer may be mixed up with them. Until as much is collected as will make up a bed of the required size, let them be spread very thinly on the floor of a dry airy shed, and turned once a day, to prevent fermentation from taking place.

HARDY FRUIT GARDEN.

The young shoots of fruit trees grafted in spring should be securely tied, as they are very liable to split off in windy weather. In doing so, commence at once to train them to whatever shape you have decided on adopting; and fix this year's shoots in the manner best adapted to form the foundation of the future tree. For Pear trees, the shape now most popular is the pyramidal, or, more properly speaking, the conical; and for Apples the cylindrical. To produce the latter shape, the young shoots must be trained outwards horizontally, forming radii of a circle of the required diameter; upon the outside of this, upright stakes should be fixed, 9 inches asunder, to support the perpendicular branches; these will be gradually allowed to proceed upwards, until they have arrived at a convenient height for training and fruit-gathering, when further progress upwards must be prevented. Care must be taken, in the course of their growth, that a proper number of side spurs is produced, so that the perpendicular stems may form wreaths when in flower and fruit. A few side shoots should be allowed to grow long enough to connect the perpendicular shoots one with another, so that the trees may in a short space of time become self-supporting; as the branches will, in a few years, have become sufficiently fixed to keep their proper position without the assistance of stakes, which will of course be then removed. To produce pyramidal Pear trees, only one main shoot must be permitted to proceed, which will form the main stem of the tree; the growth of side shoots, especially of those towards the lower part of the tree, should be assisted and regulated by judicious stopping of any shoots which are progressing too rapidly for their neighbours.

State of the Weather near London, for the week ending July 4, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 12th and 13th, 1847—therm. 90 deg.; and the lowest on the 9th, 1839—therm. 40 deg.

Notices to Correspondents.

TO OUR CORRESPONDENTS.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

ASPARAGUS BEDS: *J W.* There is no reason why low annual vegetables, which have not deep roots, should not be grown among Asparagus—*provided* the beds are well manured after such vegetable crops are removed.

BACK NUMBERS: Full price will be given for No. 46, 1848.

BOOKS: *W L.* We are unacquainted with the book. It is not likely, however, to answer your purpose. Moore's "Agricultural Grasses" would be much better.

CAMELLIAS: *P T O.* If the rat has eaten the stems of the Camellias down to the graft, then there is nothing left but the stock, and all that you can do is to regraft, or throw the plants away.

DAHLIAS: *Anon.* It is a common practice to thin their shoots, when they appear to be rather too crowded.‡

EXHIBITIONS: *Manchester.* Hoya bella should be shown among "stove plants," and Lilium speciosum among "Ornamental plants." There is, however, an awkward ambiguity in the prize lists, as to the meaning of "ornamental" and "herbaceous" plants.

GARDENERS' BENEVOLENT INSTITUTION: We have received a letter signed W. A. Addison, 4, Navarino-grove, Dalston, which regard for the great objects which it endeavours to injure, prevents our printing.

GERANIUMS: *A Florist.* You will never flower the Prickly Geranium in a Peach-house. You must put it in the full sun all the summer, then rest it till winter, and afterwards force it gently in a bright light house. If you do not succeed the first year you may the second.

GREENHOUSES: *Plumbago.* We cannot undertake, as we have often stated, to answer legal questions.‡

INGA PULCHERRIMA: *Beta.* See p. 639 of our volume for 1844.‡

INSECTS: *Ravenswood.* The grubs sent are the larvæ of the common daddy-long-legs. Examine the roots of Pinks and Carnations as soon as they appear to flag, and also destroy all the winged insects you can. The little ones were entirely destroyed, being sent loose; from your description they are the common American blight (Aphis lanigera). Wash the parts affected with gas-tar water, or daub the patches over with clay and soapsuds. *W.—A R.* The caterpillars found on the Beech are not those of any species of moth, but of a saw-fly (Tenthredo), which we will endeavour to rear. *W.—G H.* The animals sent are threadworms (Gordius aquaticus). They are in no wise injurious to vegetation. *W.*

MONSTERS: *G H.* The viviparous Clover is common; the roots will probably retain the property if transplanted.

MOTHS: *Beta* has been told that bitter Apple (powdered Colocynth), is an excellent preventive against the inroads of moths. Is this a fact?

NAMES OF PLANTS: *H K.* 1, Nephrolepis exaltata, Schott; 2, Stenochlæna scandens, Smith; 3, Polypodium trichodes, Reinw. *S.—Amicus.* 1, Some kind of Caragana; 2, Spiræa chamædrifolia? 3, S. ariæfolia? 4, S. tomentosa; 5, S. alpina? 6, S. betulæfolia? 7, S. paniculata? 9, Andromeda calyculata. It is not possible to name accurately, if at all, such plants as these without flowers.—*Rougham.* Some unpublished Trichopilia, and Osmunda regalis; not only a native of England and Europe generally, but of the tropics. *S. — A H.* We will make inquiries, and report further. — *A A A.* Canadian Poplar. The Rose is very curious, but spoiled by bad packing.—*J B.* It is the variety of Lilium bulbiferum called Lilium umbellatum in the "Botanical Magazine," t. 1018.—*Diss.* Cratægus torminalis. —*J W G.* Tamus communis.—*Truro.* Poa rigida.—*N B.* 1, Teucrium fruticans; 2, a Helianthemum not determinable by such a fragment; 7, apparently a morsel of a leaf of Melianthus major. — *H B.* Bifrenaria racemosa. — *H H.* Nephrolepis exaltata, Schott. *S.—H B.* 2, Pteris crenata; 4, Nephrodium molle. *S.—J B.* 1, Adiantum æthiopicum; 2, 3, and 8, Asplenium fragrans; 4, Pteris longifolia; 5, Nephrolepis exaltata; 6, Phymatodes Billardierii; 7, Pteris serrulata; 9, Cassebeera hastata; 10, Lycopodium denticulatum. *S.—C B.* Hieracium pilosella.

PELARGONIUMS: *G P.* Statiuskii, Statiuskii, and Statiaskii, are all names given to one variety of fancy Pelargonium. It is some proper name, with the right mode of spelling which we are unacquainted.‡

POTTING: *W.* As a general rule in potting, there should be about 1 inch of crocks for drainage, then one-third rough soil, one-third finer, and the upper moderately fine for a finish. If the drainage consists of some material that will yield food to the plants, as bones, for instance, so much the better.‡

ROSE LEAVES: *A Subscriber.* They are attacked by the common Erisyphe. The mischief is now *done*; nothing seems to stop the progress of such mildews so well as flowers of sulphur applied upon their first appearance. Did we make that promise? Then we will surely keep it.

TOOLS: *R Sawyer.* We cannot do the work of advertisers.

TREE PÆONIES: *A Country Gardener.* The buds were probably killed by frost, especially if they were shone upon in a frozen state. Cover your Anemones with 2 or 3 inches of leaf-mould and cow-dung mixed. Do it just before they begin to grow again.

VINES: *X Y Z.* Your Vine leaves appear as if they had imbibed some poisonous matter from the roots, for the stalks are brown and half rotten—which would not be the case if they had been merely scorched. They may also have perished in consequence of having absorbed some deleterious matter.—*Young Vine Grower.* Luxuriant growth and a damp atmosphere have caused the small green excrescences, which have alarmed you, to appear on your Vine leaves. They will do no harm.‡

WALKS: *M B.* If you use salt water strong enough it will kill weeds on gravel walks; but after a time other weeds will come and grow faster than the first.

SEEDLING FLOWERS.

PELARGONIUMS: *Dorking,* and *M, Chester.* Both much spoiled by carriage; but apparently inferior to kinds already in cultivation.*

PETUNIAS: *J G.* All very handsome, and well worth cultivating.*

VERBENAS: *R W.* Pretty; but deficient in shape.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.
Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	...	£10	0 0
Clover Manure, do.	...	11	0 0
Turnip Manure, do.	...	7	0 0
Superphosphate of Lime	...	7	0 0
Sulphuric Acid and Coprolites	...	5	0 0

Office, 69, King William-street, City, London.
N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.
EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

AGRICULTURAL EDUCATION.—
THE COLLEGE, MAIDSTONE.
Visitor—His Grace the Archbishop of Canterbury.
President—The Earl of Romney.
Head Master—DAVID WALKER, Esq., M.A., F.G.S., &c.
At this Institution youths are instructed in the general branches of science bearing on Agriculture, in addition to the routine of a commercial and mathematical education.
The religious education is superintended by a resident Clergyman. Terms inclusive, 34*l.* a year.

The Agricultural Gazette.
SATURDAY, JULY 6, 1850.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, July	10	Agricultural Society of England.
THURSDAY, —	11	Agricultural Imp. Society of Ireland.
WEDNESDAY, —	17	Agricultural Society of England.
THURSDAY, —	18	Agricultural Imp. Society of Ireland.

THERE is no crop over which the farmer has so little control as the CLOVER, and there is none of more importance to him, whether we consider its intrinsic value or its usefulness in preparing the land for the following crops.

Why should the farmer have more difficulty in growing a crop of Clover than he experiences with any other? What is there peculiar about it? Why should good manuring and liberal farming give a better chance for a good crop of corn than for a crop of Clover? These and similar questions are much more easily asked than answered. Our attention has been directed to this subject by a paper in the last Number of the "Journal of Agriculture," and also by observing in our wanderings over the country, that the quantity of broad Clover amongst the hay is this year so much less than might have been expected from appearances in the spring. We wish to direct the attention of our readers to the matter, in hopes that some light may be thrown on this important subject.

In the paper above referred to, the writer attributes the failure of the Clover crop to two parasitical plants, which, like the Mistletoe on the Oak, derive their nourishment not from the land by roots of their own, but from the plants on which they grow. The first of these parasitical plants, the Broom-rape (*Orobanche minor*) is described as being quite a pest in some parts of the Continent. The other, one of the species of the Dodder, is common in England. It is said to be "dangerous to the fields of Peas, Beans, or Clover. It is difficult to guard against it, on account of the rapidity of its vegetation, and the facility with which it passes from one plant to another." There is a drawing of this singular plant, as growing upon a Clover plant, in the "Annals of Natural History," vol. xvi., 1845, and it is described as being common in Norfolk and the adjoining counties. It is quite possible, as the Dodder is very minute, that the farmer may have overlooked this singular enemy to his Clover.

According to the authorities mentioned by the writer from whom we have made the above quotations, there seems to be little doubt that these parasitical plants are one of the causes of the failure of the Clover. It is somewhat singular that deep ploughing, which every farmer knows is one of the ways to ensure a Clover crop, has been found by experiment to be a good method of destroying the seeds of these parasites. Another means for securing a crop of Clover has been found by experience to be the cultivation of Beans or Peas instead of Clover, so that the latter may be grown only once in eight years instead of once in four or five years, as is usually the practice. This plan has been found from long experience to be a great safeguard, but why it should be so, we are quite at a loss to say. It appears that the Broom-rape and the Dodder attack the Bean as readily as the Clover, so that the good resulting from changing the land with Beans, seems to point to some as yet undetected source of the mischief.

We have seen nearly every kind of manure tried on Clover, but with only partial success; even gypsum, from which so much was expected, is most capricious and uncertain in its action. Except that, as everyone must have observed, liberal manuring gives a slightly increased chance in favour of a Clover crop, we are sorry to say that the farmer in this case derives but poor comfort from his best friend, the dung-heap. The case of the Clover crop has this year been peculiarly puzzling; there never was a better general prospect up to May, and during the cold weather of that month it quite disappeared. That the frost must have destroyed it in many cases there is no doubt, but why is one portion of the same field without Clover and other portions covered?

There would seem to be three causes of the failure of the broad Clover. The first is the parasitical plants above alluded to—their cure seems to be deep ploughing. The second is frosty weather in the spring. What the third is we are at a loss to say, except that changing the land with Beans or Peas seems to be a cure, or at least a palliation. There can be no doubt but that when the land is in good heart, it will be best prepared to help the plant over any temporary evil it may suffer from the cause. But there is also another point on this subject to which we would direct attention. We have more than once advised our readers to be careful with whom they deal in purchasing guano; this advice is, if possible, of more importance in purchasing Clover seed. Chemical analysis may detect an adulteration in the one instance, but in the other the purchaser has nothing to depend on except his own slender judgment and the honesty of the person from whom he purchases his Clover seed. We do not allude to those men who, without a blush, will put into the farmer's hand *doctored* over-year seed, which they know very well will never vegetate. The increasing intercourse with the Continent has introduced into our market great quantities of German seed, which nothing but an experienced eye can distinguish from English seed, and yet, except in warm sheltered situations, it will not stand an average winter in England. The use of this seed we believe to be another cause of the failure of broad Clover. We would recommend the use either of English seed or what is known in the market as Upland Dutch, the latter being much more hardy, and consequently more capable of getting over our winters than the German Clover seed.

We shall be glad to hear if any of our readers can detect either of the two parasitical plants we have named on their Clover, Bean, or Pea crop. It is but a poor compliment to the skill and research of the present century to have to acknowledge that we hardly know anything as to the cause of the failure of the broad Clover. And yet, if we could make anything like an approximation to the cost of the Clover seed (to say nothing about the crop) which is annually sown to no purpose, the question would appear in its proper importance.

ROYAL AGRICULTURAL COLLEGE.

LIST OF PRIZEMEN at General Sessional Examination, June, 1850.

AGRICULTURE, 1st, Vincent Rice, London; 2d, Robert Holland, Mobberley, Cheshire.

CHEMISTRY, 1st, Thomas R. Luzmore, Liverpool; 2d, Edward W. Bell, Gillingham, Dorset.

NATURAL HISTORY, 1st, Robert Holland, Mobberley, Cheshire; 2d, Edward W. Bell, Gillingham, Dorset.

VETERINARY PRACTICE, 1st, Vincent Rice, London; 2d, John B. Herbert, Ross.

MATHEMATICS, &c., 1st, James M. Walters, Bognor; 2d, George B. Pennell, Exeter.

SURVEYING AND ENGINEERING, 1st, Thomas R. Luzmore, Liverpool; 2d, W. Cowen, Blaydon, Newcastle.

Cirencester, July 1.

HIGH FARMING IN NORFOLK.

THE farm of Mr. Hudson, at Castleacre, is between 1400 and 1500 acres in extent, held in two adjoining occupations of nearly equal size. About 1200 acres are regularly under crop, and somewhat over 200 acres in pasture. The four-course rotation is followed throughout, there being annually 300 acres in Wheat, 300 acres in Barley, 300 acres in Turnips, &c., and 300 acres in Clover, and Trefoil and white Clover alternately. No Rye-grass is sown with the Clovers, as, being a cereal, it is considered injurious to the following Wheat crop. The principle adopted here is to manure for every crop. Thus, for the Wheat eight three-horse loads of dung are laid upon the Clover after it is mown. This promotes a rapid growth of Clover, which is ploughed in for the Wheat crop. Salt is thrown over it in spring to strengthen the straw. Turnips are manured partly with dung and partly with artificial manures, 25*s.* an acre being expended for this purpose in guano and Lawes' superphosphate. A large proportion of the Turnips are consumed on the ground by sheep, which are also cake-fed, and the soil is thus prepared for Barley. The land is covered with clay marl once in a lease of 21 years. In the feeding of stock 10 tons a week of oil-cake are consumed during the winter, in addition to the green crops and herbage of the farm, Mr. Hudson never using less than 200 tons of cake in a year, and sometimes considerably more. Each bullock gets 10 lbs. of cake a day, besides roots, and each fatting sheep on an average ¾lb., beginning with ½lb. and ending with 1 lb. daily. The cattle are fed in open courts with sheds, well littered with straw. Thirty-six work-horses and 16 working bullocks are required for the operations of the farm. The bullocks work in pairs, two in a plough, the same as the horses, and walk quite as quickly, and in either plough or harness, get over as much ground as the horses. Each ploughman drives his own pair. The farm horses are fed on sprouted Barley, 12 lbs. each daily, besides fodder. With this feeding, on this light land, where the furrow seldom reaches 6 inches in depth, the horses are maintained in good healthy condition. A small dairy of Devon cows is kept, the produce of which is reared and fed. The ewe flock is Southdown, the fat hoggets now going on to the London market. The sheep are at present fed on Rye, sown after Wheat for spring feed, and now affording a full bite. Mr. Hudson does not sow Tares, as he considers the Tare very exhausting to the land. The whole harvest work of the farm is done by 32 mowers, each of whom is attended by one woman to gather, and one to bind up the sheaf. In carrying the crop the stacks are always made in the field where they grew, and carted home to the barn as required during winter and spring. The only kind of Wheat sown is Spalding's Red, which is found by much the most prolific hitherto tried in West Norfolk.

Twenty-seven years ago the stock annually kept on this farm was 400 sheep and 30 bullocks; it now averages 2500 sheep and 150 bullocks. The Wheat and Barley crops then did not exceed 22½ bushels an acre; that average is now nearly doubled. Every crop is drilled and the land kept perfectly clean. The roads and fences are all maintained in the best order, and the beauty and regularity of all the crops now growing on the farm sufficiently attest the enterprise and skill of the farmer.

The question of how far the four-course system of husbandry continues applicable to the present circumstances of agriculture we heard frequently discussed by the most intelligent and experienced farmers in West Norfolk. We found but one opinion on the point, and that was, that covenants were necessary to bind bad farmers, not good ones; and that with our facilities for obtaining artificial manures and food, a strict adherence to the four-course system was no longer either necessary or expedient. Accordingly in every case we met with, where a man farmed his own property, or was not restricted by rigorous covenants, the four-course was departed from. On this point we were favoured with some valuable information by Mr. Blyth, of Sussex farm, Burnham, whose style of cultivation and the high condition of whose land may challenge comparison with any in the county. For a number of years back he has been growing more and more Wheat, diminishing his Barley, and taking an additional corn crop in the course. His system now is as follows:—(1) Clover, Trefoil, or Peas, (2) Wheat, (3) Oats, (4) Turnips, (5) Wheat or Barley. He manures for every crop where he thinks it requires it. On land where the Turnips are fed off before Christmas the crop of Barley was never found so good by six or eight bushels an acre as on that which fed off later, and on that portion he always sows Wheat.

		Bushels an acre.
Average Wheat crop for seven years ending	1839 ...	25
Ditto	1846 ...	29
Ditto for two years	1848 ...	36
Average Oat crop for seven years ending	1839 ...	54
Ditto ditto	1846 ...	57
Ditto for two years	1848 ...	68
Average Barley crop for seven years ending	1839 ...	31
Ditto ditto	1846 ...	33
Ditto for three years	1849 ...	45

It will be observed that in each case the increase of average has been greatest since 1846, and this may be in part accounted for by the use of artificial manures, as a direct application to every crop, having since that year become matter of system, and also from the very rapid strides which our agriculture has made within the last four years in the hands of all who had the means, and who were not hampered by unwise restrictions from following the obvious course of improvement. It is further important to find that these increasing averages of Wheat crops have taken place simultaneously with more frequent calls on the land, there having been on this farm for the first period of seven years an annual average of 214 acres in Wheat; for the second seven years 268 acres in Wheat; for the last two years 340 acres in Wheat. *Times Commissioner.*

THIN SEEDING *v.* CATTLE FEEDING.

"Audi alteram partem."

I HAVE always the greatest possible pleasure in meeting on paper, or in person, my philosophic and most intelligent friend, the Rev. G. Wilkins. His erudition, his wit, his keen and varied powers of observation and comparison, combined with much good feeling and an immense exuberance of animal spirits, render him at all times a most exciting, amusing, and instructive companion. I should always be extra cautious of differing from my friend, but especially so when I remember that because he once exposed the folly of destroying moles, he was held up to the ridicule and censure of practical but unreflecting men, until, by accident, one of them opened a mole's stomach and found it crammed with wireworms.

Let us, however, return to the charge, and consider the two points—thin sowing and cattle treatment. I entirely agree in principle with my friend that 1½ peck of Wheat is an ample seeding under peculiar circumstances. I remember seeing in Mr. Hudson's garden, at Newby, two years ago, a piece of Wheat estimated at 12 quarters per acre from merely (I believe) 3 quarts of seed. The ears appeared to be 7 inches long, and the straws like reeds.

The success of very thin sowing is dependent on a great many "ifs." If your land is in a warm, dry, early, southern or eastern district; if you sow early; if your cultivation is garden-like in depth, manure, and cleanliness; if every grain is carefully inserted and covered beyond the ken of birds, if you have no attack of wireworm and slug, if your land is not so light that the roots of your Wheat get frozen in winter, if it is drained and the seed does not swell and burst in a wet season, if each grain is perfect and unbroken, and if your general harvest time is the third or fourth week in July; if all these "ifs" can be satisfactorily answered, there is no doubt about the propriety and advantage of very thin seeding.

I know a striking instance of this, in the case of Mr. Piper, of Colne, in Essex, who every year grows Wheat on the same land, never ploughs it, but hoes it perfectly clean, and applies soot. He dibbles 1½ peck per acre, and averages, I think 5½ to 6 quarters per acre per annum. He farms profitably. When I saw this crop five years ago, it was far too thick, with an enormous quantity of straw. Mr. Piper was here yesterday, and told me his Wheat was promising again to be an extraordinary crop. If I ever do find fault with my reverend friend, it is on account of his exuberance of statement, a sort of florid exaggeration, which is not permissible or desirable in the stern business of agriculture. For instance he says Mr. Mechi is now the thickest seeder he knows, inferentially implying that no other farmer in this kingdom sows so much as six pecks! Alas, I wish it were true, but we all of us know (and I think our friend Wilkins must too), that double that quantity is very extensively sown. Even our talented and cannie friends "over the border," scatter broadcast with liberal miscalculation their three bushels of seed Wheat, and proportionate quantities of spring corn (strange that the absence of drills should still be the weak point of our North British agriculturists). I do therefore entreat your readers to make a liberal deduction for "the poet's eye in a fine phrenzy rolling." I must also reproach my friend for suppression, as well as exaggeration. He forgot I suppose that in the sluggish autumn of 1848, he, in common with many thick seeders, lost his Wheat plant by those slimy devourers, proving that we cannot always be sure of our crop.

When my reverend friend says "that I meant to flag my Wheat," he should in candour have added "if it required it." Those were my words, but my Wheat, though very high and heavy, does not require flagging, and is not too thick. I am quite sure than six pecks per acre is the utmost quantity we dare sow. On naturally rich soils, such as my friend Wilkins's, or where an extra supply of manure is used, four pecks or even less are an ample supply. I merely sow that quantity which from experiment I have found best adapted to the poor plastic clays and barren sands of Tiptree Heath. Those who travel through the rich vegetable fen lands, must be grieved to see the ruinous effects of thick sowing. I remember in passing to Norwich, I saw the Wheat crops twisted, matted, and laid, as though a troop of wild horses had madly frolicked in them.

The desideratum is to have a full standing crop, free from weeds, and not so dense as to exclude air and light—the absence of these causes the stem to be unhealthy and spongy, instead of having that beautiful coating of pure glass which the Almighty has so wisely destined to keep the plant erect and protect the circulation of its fluids. If I used 5 cwt. of guano, instead of 2 cwt., on my Wheats, I should certainly diminish my seed by 2 to 3 pecks. When I dibble, I never exceed a bushel—the seed being properly deposited. The result of my experiments in seeding is that 1 bushel of Wheat always produces on my land more than 2 bushels; but that 6 pecks produce the best result, therefore I adopt that which pays best. Mazagan Beans, and white Peas, both produced 2 quarters more per acre last year by thick than by thin sowing.

Last year I grew 58 bushels of Beans and 48 of Peas per acre, and this year the promise is abundant. I have no objection to break a lance with friend W. either in Beans, Potatoes, Peas, or Wheat (I have no Barley), although his land is naturally far superior to mine; and I have no objection to fatten pigs against him on bare boards, backing the latter against any other system he may pursue. It is a mistake to suppose thin sowing does not produce a great weight of straw. Now, as to my animals, I do consider our clerical friend very unfeeling to so shock the nerves of your refined and humane readers by his horrifying description of the living dungeons. Poor animals! They must certainly realise Dante's expression—

"Lasciate ogni speranza voi chi c'entrati."

But how stands the fact? The animals are perfectly clean and healthy, without effluvia, and when not feeding, lying in every possible easeful position. The pestiferous exhalations exist only in my friend's brain; how they got there without having previously affected his olfactory nerves is to me a mystery. Several visitors (one having many bullocks) expressed their astonishment at Mr. Wilkins' statement, on comparing it with the fact.

I am daily more and more strengthened in my conviction that feeding on open boarded floors will be a great boon to agriculture—enabling us to keep more stock, to take our manure at once to the land, without a second cartage, or making and turning over the dung-heaps. My restless young pigs fatten quicker, being constrained to repose by the inconvenience of rapid movements on open lattice work. In conclusion, I shall say, as my friend does, "Come and see, and judge for yourselves." I don't at all approve of our rev. friend's principle of unalterability. The temper of the age is comparison, experiment, and improvement.

I annex an extract from a note just received from a very worthy clergyman, who is also a good agriculturist and a magistrate of our country.

In conclusion, I like my friend Wilkins all the better for his letter. The provocation of discussion tends to the elucidation of truth. I entirely agree in his general views of the unsatisfactory and mediocre condition of British agriculture. I shall always be ashamed (agriculturally) of my native country until I see it using its vast resources in men and money for feeding and employing the people. Travel where you will, landlord and tenant neglect alike offend the eye. We might as well intersect our gardens in every direction with worthless and scrubby trees and fences, as to permit or encourage such monstrosities in our fields, I wish I could say national gardens. *J. J. Mechi, Tiptree-hall, Kelvedon, Essex, June 27.*

EXTRACT.—"I have read Mr. Wilkins' attack on your system of cattle, sheep, and pig feeding. I must have seen it about the same time as he did, and I can only say that I entirely dissent from all his vituperations. He must not only have seen with other eyes, but have smelt with other noses. My bailiff, who accompanied me, can testify, if my own opinion wants confirmation, that nothing could be sweeter, cleaner, more comfortable, or apparently more thriving, than all the animals which we saw. As to Mr. Wilkins' unqualified disapprobation of box-feeding, I should like to show him my cattle and pigs. They are littered with straw cut into 5-inch lengths; they have not been cleaned out for some months, and yet I will leave it to a jury of ladies to pronounce whether a visit to them could offend the most fastidious eye or nose. Mr. Wilkins speaks of his crops of Wheat and Barley. I shall be happy to show a field of each, 10 acres, against him for a wager, which should be the payment of the expenses of any respectable person who should decide between us."

Home Correspondence.

Rancid Butter.—I should feel extremely obliged by your giving me any information in your power on the following subject. For the last three weeks, my cows have been making most horribly rancid butter. They are fed entirely on Grass, which they get for themselves on upland pastures. Three weeks ago the butter when fresh made was rancid, but now it is to all appearances perfectly good when it comes from the churn, and remains so for perhaps a day or a day and a half, and then it becomes quite unfit to eat. I fancied at first that it was owing to the land bearing a great number of Buttercups, but other people, whose fields are covered with Buttercups, make excellent butter. I am told there is a plant which flowers once in three years, that will make butter rancid if the cows unfortunately eat it; how far this may be true I cannot say. I have looked over my fields and can find no flower in them different from the flowers in other people's fields. In fact, I am quite at a loss to account for the fact. I have used saltpetre in the milk, but that does not appear to have any effect. If you could give me any clue by which I could discover "my enemy," I should be indeed most grateful. *W. G. D.* [It is possible the error may be in the management of the dairy. Is perfect cleanliness insured, and is the buttermilk properly removed? *W. C. S.*]

Mr. Mechi's Farming.—

Rebuke a wise man and he will love thee. Give instruction to a wise man, and he will be yet wiser.—*The Proverbs of Solomon.*

No man has done the farming interest more service than my esteemed friend Mr. Mechi; landlords, tenants, and labourers, owe him a deep debt of gratitude. At the commencement of his agricultural career, he boldly, wisely, and heedlessly of the clamour raised against him, struck at the root of many long-cherished, absurd practices and prejudices. With a very few other worthies, my friend Mechi taught agriculturists to think and inquire into some of the principles of their operations; he showed that it was no proof of wisdom or excellence to pursue a plan merely because it had been in operation for hundreds of years; but that the antiquity of a practice, as applied to European farming operations, rather than its being a proof of its excellence, is an index of its absurdity. Until lately, all the answer you could obtain from farmers, as to why they pursued this plan or rejected that, was merely because all other farmers acted exactly as they did. As a body they gave no other reason than this for many practices, for which indeed no sound reason could by any possibility be found. But my friend struck at the root of this evil, and in spite of the clamour raised against him by his practice and admirable publications, clearly demonstrated the absurdity of it. To give two examples of this: prior to his coming into Essex, farmers drained their lands, as they tell us; that is, they made drains just sufficient in numbers and just deep enough to drain away all the fertilising rain-water off their lands, and with it the best part of the manures they put on them. Landlords likewise gloried in hedge-row timber, in old worthless pollards, and frequently in wide and deep ditches where there was not often a single drop of water. All these abominations they gloried in, but my friend Mr. Mechi taught them to inquire why they did this or refused to do that; he showed them the utter worthlessness of shallow draining, and on his own farm demolished every hedge and grubbed up every worthless tree, proving, by precept and example, that age did not improve what at all times had been of no value whatever, but just the reverse. So far, therefore, my friend Mechi's services to his country were invaluable, and if any man ever deserved the general thanks of the community he has; but here, as I showed in my last letter, I reluctantly withhold further praise. My friend at the time referred to was also a strenuous and eloquent advocate of thin-seeding; but this, as soon as he had

assisted in convincing the world of its necessity, he all at once abandoned and became equally as strong an advocate of returning to the old ruinous system of wasting as much corn on a single acre of land as would seed at least half a dozen; and this is my friend's present practice. As I have shown on three farms in my parish, 90 bushels of seed Wheat shall produce this year, on the same quantity of land, a greater produce of corn, and a greater weight of straw than 135 bushels shall on my friend's farm at Tiptree Hall. And as to my friend's cattle feeding, his plan is too monstrous to require a comment; it has not even novelty to recommend it, for old King Augeas, full 3000 years since, tried it upon 3000 head of oxen, until it became such an intolerable nuisance to his subjects that he was obliged to submit to a river being let into his cattle-boxes to wash out of them the accumulated filth they contained. I quite agree with my friend in condemning manure heaps; and I have endeavoured, as far as I have been able, to prevail upon farmers to discontinue the practice of making them; but wasteful as they are, they are infinitely more philosophical than my friend's muck dungeons. The proper place is to sink a large tank in the centre of a well sheltered farm-yard, and so to make it that liquid manure-carts and dung-carts may easily be filled from it, whence the manure may be conveyed to the fields and at once ploughed into the ground. Nor is there a profit, taking one year with another, under any management, from the keeping such quantities of disgusting pigs. Once, perhaps, in every seven or ten years, when corn has been cheap and meal dear, pig breeding and keeping have been profitable; but at all other times they have been, beyond a limited number, a very losing concern. I have known several men who have done well by farming, but none of them were feeders of pigs. Beyond a certain limited number, butchers, bakers, shop-keepers, and village tradesmen of all kinds, and even labourers, will breed and fatten pigs cheaper than farmers can; and they always do breed and fatten them whenever a profit is to be made by them. But it is very different with oxen and sheep; in these the farmers have the advantage over all competitors; let my friend, therefore, if he would set a good example, keep more sheep and oxen; let him also pull down all his present ill-made cattle-houses, and fill up all his "living cattle graves," and at once erect new buildings round a long square, and sink a tank in the centre of it, capable of holding all his manure, and over this also erect a light shed to protect the manures from the rains and sun. Should my friend do this, he will have something to exhibit worthy of imitation, and he would be imitated by very many persons; but an improving age will turn with disgust from cattle confined for months together either in or over cesspools full of their own stinking excrements. *Geo. Wilkins.*

The Rule of Thumb.—Your Leading Article of June 22 contains sentiments which, for very many years, I have advocated. I have now on my table a copy of the first edition of Sir Humphry Davy's "Agricultural Chemistry," and which has been one of my text-books for all I send to the press, whether on animal or vegetable physiology. With this book, and some others of the same kind for my guide, I have written with a degree of confidence not pleasing to some persons, who, I fear, trust too much to their own judgments, or those of their grandfathers. But I never advocate or condemn farming operations until I have repeatedly put them to the test myself. It is quite true that ultimately farmers' clubs must effect some good; but it is astonishing to hear the ignorance which at present is frequently taken for wisdom at them; and I have known the greatest amounts of ignorance receive universal shouts of applause, whilst sentiments founded upon true science have been hooted down and treated with contempt. You refer to the good old "rule of thumb," permit me to give another rule, "the scowl of brow." Some years since a favourite cow of mine got to a heap of Potatoes, and eat so many that she was poisoned by them. I sent for an honest old doctor, who came and brought a drench with him; and as soon as he saw the patient he ordered a quart of ale to mix the drench in. I asked him what the ale and drench were to do for the cow, when he replied that he always gave a "drunch," and that the ale would warm her inside. I then went into my house and brought out a book in my hand, when upon seeing which the doctor exclaimed, "Hang all book doctors, I do all mine by scowl o' brow." I, upon that learned exclamation, asked what was the price of the drench, and of the journey; got the answer, paid the money, sent the doctor away, and threw his physic on the dunghill. The cow was very ill, and the doctor declared she would die; but I doctored her from my book, which was a chemical one only, and the patient recovered. The doctor had a large practice among farmers, and was considered quite a Galen by them. Some few years since, also, I took a book to my gardener to explain to him Mr. Cuthill's excellent plan for the cultivation of Asparagus, when my man, like the doctor, rebelled also against the book. "Suppose," said he, "you wanted a pair of shoes, could a man make them by looking at a book? He had been a gardener all his life, and, if he could not understand his business without a book to teach him, he would give it up, that he would." Another example I will give, and of a more serious nature. Many years since, when curate of a parish, the typhus fever raged very much in it. In one cottage three children had died, and others appeared to be dying. On my visit to the house I was joined by an individual who united in his own practice the three professions of farmer, doctor, and itinerant preacher. He was well known to the family, and well received. He placed on a table a bottle, and asked if the patients had taken what he had brought before, when the reply was that they had. I took upon myself to examine the liquid of the bottle, and found it was brandy, pure brandy. This led to an altercation between my rival and myself, he strongly recommending his medicine, and I as strongly interdicting its use; nor did I succeed without exerting some force if not violence. The sick and dead occupied a single chamber, with but one very small window in it, and the weather was very hot, it being, I remember, in the time of harvest; I found the apartment insufferably hot and offensive, and to relieve it as far as possible, I took upon myself another responsibility. I took a pole and with it pushed a hole through the thatched roof, and by means of it and the little window which I opened I let in pure and let out impure air, and then galloped off to the parish surgeon. I rejoice to be enabled to state that the hand of death was stayed, and that the sufferers recovered. I relate this little history also to exhibit a sample of the dreadful effects of ignorance, and a lack of that knowledge which is attainable by all, from the studying of books. Of course I need not add that the man with his brandy bottle, the cultivator of the earth, and doctor either could not or did not read a book. *Geo. Wilkins.*

Guano Frauds.—The *Gardeners' Chronicle* states, the loss sustained by the agricultural interest in consequence of the fraudulent practices of the "rogues in guano," to amount to upwards of a million of money,—a serious tax; it may be almost said self-imposed, because farmers will not take the precaution either to deal with honest men who may charge somewhat higher for a genuine article, or pay for having a doubtful cargo analysed, which amongst a number would be but a trifling expense; indeed less than nothing when compared to a scanty crop coming up under favour of sand, loam, and rubbish, at 9*l.* per ton; producing a satisfactory income to Messrs. A. and B., the manufacturers of the trash, but bringing ruin upon the hard working farmer. The case is so serious that the names of the parties dealing in the spurious article should be exposed; it is false delicacy to allow them to escape. The second item to be placed to the debtor side of the farmer's account will be the waste of town manure, as well as the careless manner of saving that produced at home. Town sewage, now poisoning rivers and flowing in masses to the sea, may be safely valued at a million and a half thrown away. The third item—imperfect tillage and the luxuriant growth of weeds, may be set down, together with the additional wear and tear occasioned by bad roads, at another half million, making a total of upwards of three millions, which, with common care and attention, might find its way into the pockets of the landowners, tenants, and labourers, who would circulate the cash amongst the great manufacturing towns. I believe I have not over-estimated the disadvantage resulting from negligence on the part of those connected with the land; and supposing the statement to be correct, a question naturally follows. Would it not be consistent with the interests of the cultivators of the soil to attempt to remedy the evils which are within their power? *Falcon.*

Cumberland One-horse Cart.—The discussion about Cumberland one-horse carts seems at last, after a year's rolling, to have rumbled itself to rest. The admission, on almost all sides, that light carts are best has, I hope, done some good to the cart-horses. Mr. Mechi and other practical farmers have stated that they employ even lighter carts than those of the Cumberland hills; and, with some few exceptions, the impression of your correspondents seems to be that a cart to carry (with side-boards) a ton of coal or lime, and weighing from 6 cwt. to 7 cwt., that is to say, the common Cumberland one-horse cart might be advantageously adopted pretty generally by the farmers of England, and that the ton-weight waggons, and even the 9 cwt. and 10 cwt. prize carts, might be profitably dispensed with. I trust Messrs. Ransome and May will this year have specimens of their carts to show at the Royal Agricultural Meeting, and I hope the cartwrights and others, who have abused me for introducing the subject, will examine them carefully. *L.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

PROFESSOR WAY, Consulting-Chemist to the Society, delivered a lecture before the members, at their House in Hanover-square, on Wednesday, the 19th June, "On Variations in the Chemical Composition of Water, as affecting its Agricultural Uses," his Grace the Duke of RICHMOND, K.G., Trustee, being in the chair. Among the members present were, the Earls of Lonsdale and Chichester, Lord Bridport, Hon. R. H. Clive, M.P., Sir Thomas Dyke Acland, Bart., M.P., Sir M. W. Ridley, Bart., Sir Charles Lemon, Bart., M.P., Sir John V. B. Johnstone, Bart., M.P., Sir Montague Cholmeley, Bart., Mr. Barugh Almack, Mr. Raymond Barker, Mr. Burke, Mr. Decimus Burton, Dr. Calvert, Mr. Carden, Rev. Thomas Cator, Mr. W. G. Cavendish, M.P., Colonel Challoner, Mr. W. Clavering, Mr. Capel Cure, Mr. S. Druce, Mr. Dunne, Mr. Dyer, Mr. Feilden, Mr. Fuller, M.P., Mr. Brandreth Gibbs, Mr. Harding, Mr. Fisher Hobbs, Colonel MacDouall, Mr. Marshall, M.P., Mr. Maw, Mr. C. E. Overman, Mr. Parkins, Mr. Pendarves, M.P., Mr. Puller, Mr. Pusey, M.P., Mr. Thomas Rowlandson, Prof. Sewell, Mr. Shaw (London), Mr. Sillifant, Prof. Simonds, Mr. Slaney, M.P., Mr. Augustus Smith, Mr. Wilson (Stowlangtoft), and Mr. Wrightson.

LECTURE ON WATER.

Professor WAY commenced his lecture by stating, that he intended on that occasion to call the attention of the members to three important heads of inquiry connected with water; more with a view to elicit from them practical illustrations founded on their individual experience, than to offer to them anything particularly novel or established. These heads of inquiry were the following; namely—1. On Water for Steam and other Boilers: the means of ascertaining its comparative suitableness for that purpose, and of counteracting its tendency to incrustation. 2. On Water for Irrigation: its chemical impregnation, and the theory of its action. 3. On the influence of Water, obtained under different circumstances, on the health of Cattle, Horses, and other live-stock on a farm. He remarked, that as the first head of inquiry related to the mechanical and chemical agency of inert matter, its details came within the range of analytical investigation, and he would be enabled to speak with much confidence on the facts he had to bring together under it; but as the other two heads included a reference to local circumstances, and to the influence of the vital operations of vegetation and animal physiology respectively, in the production of results, what he had to say on these points would be much less decisive, and advanced more for the purpose of seeking than for giving information.

I. *Water for Steam Boilers.*—The water from the clouds reached the earth almost pure in a chemical sense, as a homogeneous liquid, composed of the elements oxygen and hydrogen. It was distilled from the sea and land, and from the leaves of vegetables in a state of purity, and formed clouds; from which it again fell at intervals to the earth through the atmosphere, bringing with it only very minute traces, varying according to circumstances, and frequently inappreciable by the chemist, of carbonic acid gas, ammonia, nitric acid, and the effluvia arising from animal perspiration and the decomposition of animal matter. On reaching the land, however, its solvent power immediately came into operation, and it became impregnated more or less with the soluble substances with which it came in contact; common salt and gypsum were always dissolved by it, while lime and other substances were taken up by it when there happened to be an excess of carbonic acid gas present. In order to illustrate this fact, the Professor exhibited to the members a simple and striking experiment. Three glass vessels were connected together by means of bent glass tubes; the first vessel contained fragments of marble (as a pure variety of native carbonate of lime); the second, distilled water; and the third and last, a clear solution of quick-lime in pure water (or lime-water). On adding dilute muriatic acid gradually to the marble in the first vessel, carbonic acid gas was disengaged in great abundance, which passing along the tubing into the middle vessel, was there washed and freed from impurity by its passage through the distilled water, and then proceeded, by means of a connecting glass tube, to the lower part of the inner surface, where it continued to bubble throughout the clear lime-water. After a few moments the lime-water became turbid. The Professor remarked that this effect resulted from the conversion of the lime into insoluble carbonate of lime (or chalk), by its combination with a first proportion of the carbonic acid gas passed through it. In a few moments afterwards, however, the liquid regained its original transparent appearance. This change, he explained, arose from the further supply of the same acid gas, constituting the insoluble carbonate of lime a soluble super-carbonate of that earth; the liquid, in fact, being then a solution, not of lime in water, as it was originally, but a solution of bi-carbonate of lime, or of chalk rendered soluble by excess of carbonic acid. To prove that this was the case, the Professor took the flask containing this solution, and having placed it over a spirit-lamp, caused ebullition to take place. After boiling for a short time, the liquid again became turbid, from the circumstance of the heat expelling the excess of carbonic acid, and again reducing the carbonate of lime to the state of insoluble chalk. He then proceeded to show how this experiment illustrated the change which was found to take place in the waters of limestone districts, which were naturally charged with carbonate as well as the sulphate of lime; and also how it happened that, while water, rendered hard by sulphate of lime only, did no injury to steam-boilers, as that salt was not deposited on raising the water to a boiling temperature; hard water, on the contrary, holding a large amount of carbonate of lime dissolved in it by carbonic acid, did the greatest injury to them, by gradually depositing, on being boiled, such carbonate of lime at the bottom of the steam-boilers, until it amounted to a hard calcareous incrustation. Water was always rendered hard by holding in solution either the carbonate or the sulphate of lime; and, accordingly, when obtained from wells in the chalk, oolitic, and limestone districts throughout the kingdom, was always hard; becoming turbid when boiled, and depositing its carbonate of lime on that part of the internal surface of the boiler nearest to the fire. As a familiar instance, he named the fur or crust in tea-kettles, in districts where such water was used; but in the case of steam-boilers, this deposit was one of the greatest evils that could be imagined. The hard calcareous incrustation in immediate contact with the iron plating of the boiler, amounting in a few weeks to no less than from two to three inches in thickness. Prof. Way explained how the injury arose in this case;

namely, from the effect which the adhering crust had in preventing the transmission of the heat, received by the boiler from the fire, to the body of water within the boiler. He cited many curious instances of the cooling effect of this free transmission of heat on substances under other circumstances most fragile and combustible; and the contrary effect when the transmission of such heat was obstructed, as in the case of calcareous incrustation, when the heat was arrested by the solid slow-conducting body, and the temperature raised above that of boiling water. He stated that however odd it might sound to make the statement, it was no less true, that water might be boiled in an orange-peel, in an egg-shell, or in a vessel made of thin wood, or even of common writing-paper; the heat applied to the external surface being rapidly transmitted to the water, and the heat carried off in the steam generated, while the material employed for the boiler suffered no injurious effect from such application of heat. He related a singular instance of this kind, in the case of a person at Liverpool, who had frequently had his cotton-mill burnt down. The party in question imagined, that if he had a large reservoir for water placed at the top of his factory, constructed of wood instead of metal, the wood, in case of fire, would be immediately burnt to ashes, and the water would consequently be set at liberty and extinguish the fire. The fire unfortunately did break out again, as it was feared it would, but the wood, instead of being charred or burnt, remained entire, and, being encircled by the flames, the water continued to boil in its wooden reservoir as long as any remained. The furring of a boiler preventing this transmission of heat, and thus causing injury to the substance of the boiler, was the reason why, in some districts, where the water was charged with bi-carbonate of lime, the boilers were found to wear out sooner than in others; and why the railway companies had been led either to seek for soft water, or to soften the hard water they had been in the habit of using, by the addition of some substance that would prevent its furring their boilers. The London and South-Western Railway Company had used the substance known in commerce as sal-ammoniac, with great success; by dissolving one ounce of it in 90 gallons of water, in tanks kept specially for the purpose. This substance was the neutral salt, so long familiar to chemists as the muriate of ammonia, being a compound of muriatic acid and ammonia. Its action in removing the hardness of water arising from bi-carbonate of lime was explained by Professor Way in the following manner. When muriate of ammonia and carbonate of lime are brought together in solution, a double decomposition ensues, each of the four combining substances changes its relative position, and two new salts are the result: namely, carbonate of ammonia, which is volatile, and accordingly makes its escape into the atmosphere; and muriate of lime, one of the most deliquescent salts with which chemists are acquainted, and which consequently remains in the water in a state of complete and almost permanent solubility. It might, he remarked, be said, that the ammonia of the sal-ammoniac carried off the carbonic acid, while the muriatic acid dissolved the lime, thus liberating the water from the chemical conditions under which its hardness was occasioned. Professor Clark, of the University of Aberdeen, had, however, proposed a plan for softening water rendered hard by carbonate of lime, which Professor Way considered much better than the one just described, and which might be adapted to the uses of agriculturists. This plan consisted in adding to such water a certain quantity of quicklime, which would unite with the excess of carbonic acid, and become converted into carbonate of lime, at the same time that it would reduce by such abstraction the bi-carbonate also to a state of carbonate, and both being insoluble, they would, of course, fall as precipitates to the bottom of the vessel, or other enclosure in which the water was contained, leaving the water entirely free from the bi-carbonate of lime to which its hardness had in a great measure been owing. He then proceeded to describe Professor Clark's system of soap-tests, for ascertaining the relative degrees of hardness possessed by certain waters. He remarked that hard water, as was well known, curdled soap, which would not produce a lather until such hardness had been overcome. Professor Clark had recommended a solution of white curd-soap in spirit of wine of a certain strength to be employed in his testing. This solution would at once produce a lather with soft water, but not with hard water until a certain quantity of the solution had been added to it for the purpose of counteracting the hardness: when lather of a proper firmness had been gained, the amount of standard solution employed to produce the effect indicated the degrees of hardness of any particular water; thus a standard of comparison was established, by which the choice as to different sources from which it would be most advantageous to procure water could be satisfactorily determined. Prof. Way then performed an experiment with this soap-test, on spring-water from the chalk at Croydon, in comparison with water from the Thames; the former indicating a hardness of about 18°, and the latter of about 15°. The operation consisted simply in adding to the water, from a graduated pipette or suction tube, successive measures of the solution, until the water when shaken up maintained a lather on its surface for five minutes. The number of measures then indicated the quality of the water, two soap measures being equal to one degree of hardness. The process, he described, as easy, exact, and simple; and one which might be practised by any gentleman who was interested in such subjects, without spoiling either his furniture or carpets. It would also indicate the hardness resulting from the presence of sulphate of lime, as well as that from the bi-carbonate; though, as he had previously remarked, water hardened by sulphate of lime offered no objection for use in steam-boilers, as the sulphate by boiling did not become deposited, as was the case with the carbonate; in an economical and domestic sense, however, water rendered hard by either of those salts of lime was objectionable. Professor Way then observed, that Professor Clark, in recommending quick-lime to soften water containing the bi-carbonate, advised such quantities of lime to be added as a preliminary trial by the soap-test process should indicate as being requisite. Such water would, by this process, be rendered soft for domestic purposes, and for steam and other boilers. The only difficulty consisted in tanks being required for the due subsidence of the chalk thus brought into an insoluble state in the water; but that was an obstacle which would no doubt be surmounted; for when it was considered how great the benefit of this plan would be found, not only in ordinary families but in union-houses and prisons; that it was estimated that in London alone 600,000*l.* every year was expended in the purchase of soap, one half of which was wasted in the hardness of the water; and how important a point it was in the processes of bleaching, dyeing, and other staple manufactures carried on at Bolton, Manchester, Bradford, and other places, to have a soft water in which lime was absent; it would, he thought, be well worth the while of all parties interested in so important a question to make arrangements for the depositing tanks required. The Professor concluded this part of his subject by throwing out hints by which soft water might perhaps be artificially obtained on a large scale and at little cost where it did not occur naturally. He remarked that water was found by experience to become softened by passing through the soil; water only, however, which was rendered hard by the bi-carbonate of lime. Thames water filtered through clay made permeable by the admixture of sand, was found to become as soft as by Prof. Clark's process. Drainage water through regularly permeable stiff soils was more suitable for steam-engines than spring-water. But whether water thrown over the land would by that means become soft, he was not prepared to say. When, however, it was considered that one acre of land received every year on an average 500,000 gallons of pure rain-water, sufficient for the wants of 35 people during that period, it might be a question whether poor sandy land or bad moorland might not be covered with flat tiles for the purpose of collecting the rain-water, which might be conveyed in earthen pipes to the places required for its use. He merely offered this suggestion for the consideration of parties more conversant than himself with the practical bearings of such an undertaking.

II. *Water for Irrigation.*—Professor Way remarked that, for the purpose of irrigating, he thought that water should be hard, and not soft as for other purposes: that it should contain the sulphates and carbonates of potash, soda, and magnesia, including organic matter, as all these were substances that would be taken up and retained by the land. If this view of the subject were the correct one, it would follow that the water in granite districts would, from its softer nature, not be so useful in irrigation as that in other districts where lime and other earthy substances were dissolved by the water passing through them. On a former occasion Sir John Johnstone had named to the Council the failure of some irrigation of his from the supposed circumstance of the absence of mineral and earthy matter in the water, from the water being in fact too pure for the purpose. Sir John Johnstone being thus appealed to, replied, that, in the water to which Professor Way had alluded, there was no trace of lime whatever. The irrigation had been laid out by the late Dr. W. Smith on a thin moorland sandstone rock; there was no lime whatever. Professor Way then proceeded to say, that, in Derbyshire, and at Bala Lake, in Wales, the water was exceedingly soft and pure, but considered as unfit for irrigation. He felt no doubt that irrigation would become much more general than it had been; and the subject was more interesting at the present time on account of the Society's ensuing country meeting being about to be held in Devonshire, where irrigating operations had been so successfully carried out. He should, on that occasion, select specimens of the different waters, under different circumstances, for the purpose of analysis, in order that he might report, as requested by the chemical committee of the Society, the result of his inquiries on that interesting branch of his researches. It had been found, by ascertaining from analysis the nutriment required by the Hop-plant, that only those soils that contained phosphate of lime and potash, would be suitable for the cultivation of that plant; namely, such soils as those on the green sandstone of Sussex, Kent, and Surrey; and that what theory had thus prescribed as the condition, practice had actually proved to be the most advantageous in fact, the cultivation of Hops having been most successfully carried out on the soils in question. He thought it would also be found, analogically, that successful irrigation would probably be found to be confined to certain districts; namely, to the limestone principally. He thought it might be a question how far the influence of that operation was due to the temperature of the water, or its chemical composition, or to both; he himself considered the chemical nature of the water to be the most essential; at the same time, he was free to confess that we had all to learn upon this subject, and he trusted that an inspection of the Devonshire meadows would lead to further inquiries on the important questions connected with this subject.

III. *Water for Cattle.*—The Professor commenced this third head of his lecture by remarking that he believed it was a generally observed fact, that cattle liked the water of ponds, while they disliked that of limestone springs; that they preferred to quench their thirst in a green offensive collection of stagnant water, rather than in a running spring. In Bedfordshire he had seen cattle much relish a bad water filled with confervæ and animalculæ; which, however, was the only water to which they happened to have access. Farmers generally supposed that the cattle were fond of such water, on account of the green vegetable matter it contained; and a distinguished professor had explained the fact by supposing such water to be "meat and drink" for the cattle. It was certain they did not like hard water; and it gave a staring coat to horses when they were obliged to drink it; and when it was considered that water in chalk districts contained from 60 to 70 grains of carbonate of lime in the gallon, while London water (which was hard compared with others) contained only from 15 to 16 grains, it would be obvious how much difference would be found to exist in different waters. He regarded a good supply of water essential to health; and thought it a point of great importance to ascertain the kinds of water most suitable to the animal economy under different local circumstances. Prof. Way concluded his lecture by expressing a hope that the members present would communicate to the meeting such cases of the practical effects of hard water on the health of cattle, as it had been his object, in the remarks he had then made, to elicit from them.

Royal Patriotic Society for the Improvement of the Highland Small Tenantry.—Mr. Bond, the secretary, lately delivered the following address, on behalf of this useful institution, at a meeting in the Isle of Skye, when a branch society was formed. He said, previously to the Potato failure, an urgent necessity was felt to exist for ameliorating the condition of the humbler classes; and encouraged by the successful efforts of a kindred institution in the south, the Patriotic Society was established. Its principles and plans had been maturely weighed, and were supported and confirmed by unquestionable facts. The eleemosynary support of the Highland population was as impracticable as it was inexpedient. The great principle, therefore, of the institution was, so to aid industry as to render it the instrument of its own elevation. He then adverted to the examples afforded by China and Holland in supporting a far larger population than in Britain, through the adoption of provident and economic industry, explaining the system of stall-feeding, spade husbandry, green cropping and liquid manuring, whereby the possessors of small farms, having but trifling if any advantages over the Highland crofters, are enabled to raise a great amount of dairy produce, and largely supply the British market, and, as the fruits of their exertions, possessed comforts far beyond those which the people here had ever thought within their reach. Having demonstrated the applicability of such an improved system of husbandry to the Hebrides, by adverting to its already successful adoption and progress in Gairloch, where the soil was inferior to the general quality of land possessed by crofters here, he stated that it was the object of the Patriotic Society, by means of personal as well as printed instruction, and by the example of model crofts, to disseminate and to extend an improved system of husbandry among the crofters which, humanly speaking, must result in the securing of a much greater amount of food than had hitherto been obtained. The munificent contributions for the relief of destitution, made shortly after the institution of the society, had forestalled it of funds, and although it had done what it could to originate permanent improvements, its means had been inadequate to the field it should occupy. The Queen and her Royal Consort, however, had early favoured the society with their support; and he was glad also to state, that the committee of the Perthshire Ladies' Highland Relief Association, approving of the plans of industrial economy advocated by the Patriotic Society, had honoured him, as its humble representative, by deputing him to select a number of the more hopeful crofters for instruction and aid, and for whom leases would be obtained; he had also made arrangements for establishing model spade farms in connection with the existing country schools. Mr. Bond then explained the satisfactory results of such schools, which had been established in various parts of England, and had been found to benefit the teachers, the pupils, and their subsequent employers. He regretted the destitution that still prevailed with increased intensity in most Highland districts, and which would be overwhelming should the Potato fail again this year also. He trusted that, under the blessing of a merciful Providence, it would not fail; but he again urged upon crofters, that, humanly speaking, the only way for them to escape from the calamity of famine, was by their cultivating every available patch of land in their possession, and raising Turnips, Carrots, Parsnips, Cabbages, and similar articles of food. If they economically saved and applied the liquid as well as solid fertilising substances about their dwellings to their crops, they would insure much greater returns than they had ever before received. He was glad that the Perth committee had advanced loans of seed corn to many crofters in Skye, and only regretted that the supply was not co-extensive with the want of seed corn throughout the

Highlands, and he called upon the recipients to strive manfully in the battle of industry they had to wage, the quantity and the quality of the soil generally possessed by them being capable, under such a system as he had individually, publicly, and by the medium of printed directions, urged upon them—of raising food for themselves and families, and of paying a fair rent for their land.

Review.

Report of the Agriculture of the County of Lancaster, &c. &c. By William Rothwell, Winwick, Land Agent, &c. Groombridge and Sons.

THE author of this pamphlet ought not to have prefaced it by a charge of unfairness against the authorities in Hanover-square. It appears that this essay was intended to compete for the prize offered by the English Agricultural Society, for the best statement of Lancashire agriculture, but was placed beyond the pale of competition by its non-arrival at their office within the time specified. The writer may depend upon it that the English Agricultural Society and the judges they may appoint have but one object in view in the discharge of their duty; and that is, to give an honest judgment, within the limits assigned by their published rules.

It is perhaps unfortunate on his own account that he did not succeed in completing his task before the day after which no further essays could be received, though on the relative merits of this and the prize essay we will not give an opinion. At all events we and other readers have this advantage, arising out of the accident which hindered him—that *two* excellent additions to our agricultural library have thus been made; for certainly Mr. Rothwell's statement has the merit of ample detail and description of successful farming; it is just the sort of work for those who prefer statements of fact to statements of argument; and we find that we have marked nearly 20 passages descriptive of farms and farm practice as proper for extract. Some of them we shall from time to time lay before our readers. Meanwhile we hope that the work itself will be widely read; it contains the views of a "practical" and an intelligent man of long experience in farming.

Calendar of Operations.

JULY.

EAST LINCOLNSHIRE FARM, *July* 1.—We have now completed Turnip drilling, having had a favourable time for it throughout. Those first drilled have had the benefit of some nice warm showers, and look a good healthy green, with no fly to be seen as yet; but we are beginning to want more rain for those last sown, as well as for the Grass, of which none will be ready to cut before the next fortnight. Some farmers in the neighbourhood have this year ridged their Swedes and other Turnips; the only objection to this is their being more exposed in case of a dry season, especially if the land lies high; but on low marshy land they may be generally set in ridge with advantage. Another reason for Turnip ridging is of course for the sake of covering in the dung; but as we manure in the winter, the Turnips are drilled on the flat, at 18 inches apart. Our wool is just disposed of at 25*s.* a tod. The number of sheep clipped this summer was 700; of these we are selling off the wethers fat (shearlings), having been kept through the winter on cakes with their Turnips—the oilcake being continued after their removal to Grass (from ½ lb. to ¾ lb. each sheep). The farm horses now have a load of Grass led for them daily, which is cut up with their chaff. We have about 30 calves, which are beginning to improve as summer advances. They were assisted in their rearing with Linseed soup, which is found to answer very well. Our last year's Wheat is now all sold, the last making 42*s.* per qr.—weight, 14 stones a sack. From this it may be judged whether our average is not more than 26 bushels per acre, as stated by the commissioners—36 bushels would be a fairer estimate. *H. E.*

Notices to Correspondents.

AMERICAN CHURN: *Messrs. Key and Mitchell.* It is, we submit, best for all parties to let the discussion take its course, without any interference on the part of those who may be interested in the sale of the invention. "*Experting*" did nothing but what was right, when he stated his experience of the subject—and we cordially back his request for the experience of others—begging him and them at the same time to give it in substantive figures, expressing time and quantity, rather than in mere adjectives expressive of quality and speed. Of course we derive from this evidence irrespectively of what it tells; and those who have found the churn to answer their expectations will be as gladly heard as others; but it is better for these statements to come direct from those who have purchased and used the machine. Those who are interested in its sale will surely be the first to acknowledge this.

A COUGH: *J W G S.* It may be serious or not, according to the seat of irritation, and the amount of disease producing it. We would recommend a seton to be inserted in the skin covering the throat. *W. C. S.*

DRAINAGE: *T J Pointing.* Probably Smith of Deanston's pamphlet, which may be had of Messrs. Drummond, Stirling; and the contribution of Mr. Parkes to the "Journal of the English Agricultural Society" in their 4th and 7th volumes, will give the opposite theories on this subject as fully as you will anywhere find them developed.

GRATES: *Rus.* Will our correspondent signing himself "ANON." in the *Agricultural Gazette* of June 1st, have the goodness to describe the merits "of the cheap and useful grates" which he recommends, and state where made.

OSIERS: *L.* See p. 69 in our Vol. for 1845, and p. 46, 1849. Will any one give us his experience on the management of Osiers Also on the cultivation of Rushes.

SEWAGE WATER: *M B.* We shall be glad to publish an account of your methods and of your experience. The analysis would be costly. If you are a member of the English Agricultural Society you had better apply to Prof. Way on the subject.

SMALL FARM: *Mechanic.* The rotation suggested seems proper enough, so far as the preservation of fertility in the land is concerned; but it will not give you sufficient summer food to enable you to keep an equally numerous stock all the year round. You require more land in Cabbages; instead of "Turnips and Swedes," you might advantageously have No. 5 in Cabbages followed by transplanted Swedes.

STEAM NAVIGATION: *L.* There was an account in a Marseilles newspaper some months ago, of a screw steam-vessel entering that harbour without any funnel or other unpicturesque appendage, so that she really seemed "to walk the waters like a thing of life." For river and lake navigation a handsome barge instead of the present funnelled and paddle-boxed vehicle would be very desirable. Perhaps some of our readers may know something more of the invention, and will tell us whether (by gun-cotton or other cleanly propulsion), it still continues to "go a-head."

TO CROP 10 OR 11 ACRES: *W D C.* The following table will probably give the requisite information.

TRANSMUTATION OF SPECIES: *N T.* It certainly has been asserted, as you say; or rather it has been asserted that a particular sort of grain, sown and cut down, and not allowed to produce its seed till after repeated cuttings, will ultimately yield otherwise than "after its kind." But there seems little reason to doubt that the idea is mistaken.

Markets.

COVENT GARDEN, JULY 6.

Vegetables are abundantly supplied. Strawberries and Hothouse Grapes are both plentiful, and the same may be said of Pine-apples. The supply of Peaches and Nectarines is still well kept up. Ripe Gooseberries fetch from 4*s.* to 6*s.* per half sieve. Walnuts and Chestnuts are abundant; Oranges and Lemons though scarce are sufficient for the demand. Young Carrots and Turnips may be had at from 3*d.* to 6*d.* a bunch. Potatoes fetch from 1*d.* to 2*d.* per lb. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Cinerarias, Lily of the Valley, Pinks, Carnations, Rhododendrons, Ranunculuses, and Roses.

FRUITS.

Pine-apples, per lb., 5*s* to 8*s*	Lemons, per doz., 1*s* to 2*s*
Grapes, hothouse, p. lb., 2*s* to 6*s*	Oranges, per doz., 9*d* to 1*s* 6*d*
Peaches, per doz., 6*s* to 18*s*	— per 100, 5*s* to 12*s*
Nectarines, per doz., 6*s* to 18*s*	Almonds, per peck, 6*s*
Strawberries, p. punn., 6*s* to 1*s* 6*d*	— sweet, per lb., 2*s* to 3*s*
Cherries, per lb., 6*d* to 1*s* 6*d*	Walnuts, p. 100, 1*s* 6*d* to 2*s*
Melons, each, 4*s* to 6*s*	— p. bush., 16*s* to 24*s*
Gooseberries, green, per half sieve, 1*s* 6*d* to 2*s* 6*d*	Nuts, Barcelona, per bush., 20*s* to 22*s*
Currants, p. half sieve, 4*s* to 6*s*	— Brazil, p. bsh., 12*s* to 16*s*
Raspberries, p. pottle, 6*d* to 8*d*	Kent Cobs, 90*s* to 100*s* p. 100 lbs

VEGETABLES.

French Beans, per 100, 1*s* to 2*s*	Onions, p. bunch, 2*d* to 6*d*
Asparagus, p. bund., 9*d* to 4*s*	— Spanish, p. doz., 1*s* 6*d* to 4*s*
Rhubarb, p. bundle, 2*d* to 4*d*	Shallots, per lb., 6*d* to 8*d*
Cabbages, per doz., 6*d* to 1*s*	Garlic, per lb., 4*d* to 8*d*
Cauliflowers, p. doz., 2*s* to 4*s*	Artichokes, per doz., 2*s* to 4*s*
Peas, per sieve, 1*s* 6*d* to 4*s*	Vegetable Marrows, per doz., 1*s* to 2*s*
Beans, per sieve, 1*s* 6*d* to 2*s*	Lettuce, Cab., p. sc., 2*d* to 1*s*
Greens, per doz., 1*s* to 1*s* 6*d*	— Cos, per score, 6*d* to 1*s*
Sorrel, p. hf. sieve, 6*d* to 9*d*	Radishes, p. 12 hands, 9*d* to 1*s*
Potatoes, per ton, 100*s* to 200*s*	Small Salads, p. punn, 2*d* to 3*d*
— per cwt., 10*s* to 12*s*	Mushrooms, p. pot., 9*d* to 2*s*
— per bush., 4*s* to 6*s*	Fennel, per bunch, 2*d* to 3*d*
Turnips, per doz. bun., 3*s* to 6*s*	Savory, per bunch, 2*d* to 3*d*
Red Beet, per doz., 1*s* to 2*s*	Thyme, per bunch, 2*d* to 3*d*
Cucumbers, each, 1*d* to 2*d*	Parsley, p. doz. bun., 1*s* to 2*s*
Leeks, per bunch, 2*d*	— Roots, p. bdle., 9*d* to 1*s*
Celery, p. bundle, 1*s* to 1*s* 6*d*	Marjoram, per bunch, 8*d* to 9*d*
Carrots, per doz., 4*s*, to 6*s*	Mint, green, per bunch, 2*d*
Spinach p. sieve, 1*s* 6*d* to 2*s*	Watercress, p. 12 bunch., 6*d* to 9*d*
Horse Radish, p. bdl., 1*s* to 4*s*

HOPS.—FRIDAY, July 5.

Messrs. PATTENDEN and SMITH report that the market is very quiet. Duty estimated at 175,000*l.*

POTATOES.—SOUTHWARK, July 1.

The Committee report that the market is so over supplied with old Potatoes from the Continent, that any price is taken sooner than allow them to rot in the stores. English are quite finished. As this will be the last report of the season, we take the opportunity to say we have every reason to hope the coming crop of Potatoes will be more abundant than it has been since the first appearance of the disease. The ground planted in the United Kingdom is greater than it ever was before, and at present nothing can look more healthy than the plant does. The present price of Rhenish whites is 20*s.* to 30*s.*

SMITHFIELD, MONDAY, July 1.

The number of Beasts is smaller; trade is brisk at a small advance on the best qualities. There is a considerable falling off in the supply of Sheep, and consequently prices have improved. We have more inquiry for choice Lambs. Calves are still plentiful, and make low prices. From Holland and Germany there are 393 Beasts, 2220 Sheep, and 177 Calves; from Scotland, 100 Beasts; from Norfolk and Suffolk, 1700; and 600 from the midland counties.

Per st. of 8 lbs.—*s* *d* *s* *d*	Per st. of 8 lbs.—*s* *d* *s* *d*

	Pigs ... ... 2 8 — 3 4

Beasts, 3409; Sheep and Lambs, 29,900; Calves, 246; Pigs, 295.

FRIDAY, July 5.

We have a fair supply of Beasts, and the demand is not large; it is therefore difficult to realise Monday's quotations. The number of sheep is large; trade is slow, but there is very little alteration in price. Good Lambs are scarce, and readily disposed of at rather more money; all kinds meet with a more ready sale. There are not quite so many Calves as of late; on the average trade is better for them. From Germany and Holland there are 100 Beasts, 770 Sheep, and 179 Calves; from Scotland, 100 Beasts; and 102 Milch Cows from the home counties.

MARK LANE.

MONDAY, JULY 1.—The arrivals of foreign Wheat last week were very large; a great deal of it is in unsaleable condition, and scarcely a cargo in perfect order. The supply of English by land carriage samples to this day's market was even less than last week, and realised fully the prices of this day se'nnight, red in some instances commanding a trifling advance. Fine dry foreign met a retail inquiry at former prices, but very little progress could be made in other descriptions.—Spring corn of all sorts maintains our quotations, excepting the out of conditioned parcels of Oats and Barley: these are less saleable.

ARRIVALS IN THE PORT OF LONDON LAST WEEK.

FRIDAY, JULY 5.—The arrivals of Wheat from abroad this week consist of 10,640 qrs., but the supplies of all other grain, both English and Foreign, are small. The attendance at market this morning was not large; nevertheless, there were several country buyers from a distance, and a more general inclination was evinced to purchase Wheat than of late, particularly on speculation, but the firmness of holders, who for the most part insisted on an advance in price, caused the amount of business to be comparatively limited. A few cargoes of floating Polish Odessa have changed hands, at 35*s.* to 36*s.* per qr., cost, freight, and insurance. Spring corn of all kinds fully maintains our quotations. There is a better demand for Flour at rather higher prices.—The nominal value of floating cargoes of Galatz Maize is 28*s.* per qr., including freight and insurance.

LIVERPOOL, FRIDAY, JUNE 28.—Of English and Irish produce the receipts into this place since Monday last are altogether trivial; from the American States, however, we have to note 10,344 qrs. of Indian Corn, with 4414 barrels of Flour, and from Europe, including Egypt, 5309 qrs. of Wheat, with 3493 sacks of Flour from France. We have to report a heavy sale for all descriptions of Wheat. Barley, Malt, Beans, and Peas barely sustained our last currency.—TUESDAY, JULY 2.—The grain trade has been steady during the week. There was a fair extent of Wheat sold this morning, dealers paying much the same rates as on this day week. Nor was there any change in the value of any other article, except a decline of 1*s.* per qr. on Indian Corn. Prices: Wheat, English, red, per 70 lbs., 5*s.* 6*d.* to 5*s.* 10*d.*; white, 5*s.* 9*d.* to 6*s.* Barley, Scotch and Irish, per 60 lbs., 2*s.* 9*d.* to 3*s.* Malt, English, per qr., pale, 48*s.* to 52*s.* Oats, English and Scotch, per 45 lbs., 2*s.* 8*d.* to 2*s.* 10*d.* Beans, English, per qr., 27*s.* to 31*s.* Peas, do. do., 25*s.* 6*d.* to 26*s.* 6*d.*

Second Edition, Revised and Enlarged, price 4s. 6d.,

RURAL CHEMISTRY:

An Elementary Introduction to the Study of the Science in its Relation to Agriculture.

BY EDWARD SOLLY, F.R.S, F.L.S., F.G.S.,

Honorary Member of the Royal Agricultural Society of England, Professor of Chemistry to the Horticultural Society of London, Lecturer on Chemistry in the Honorable East India Company's Military Seminary at d discombe, &c., &c.

PREFACE TO THE SECOND EDITION.

"In preparing a Second Edition of this little book, the opportunity has been taken of correcting several errors which the First Edition contained. The whole has been carefully revised, and such additions have throughout been made, as the advanced state of knowledge rendered necessary. In particular, the Tables of Analyses have been greatly extended, by the addition of the latest and most complete Analyses of almost all those plants which are cultivated as crops, as well as of the principal substances employed as manure."

CONTENTS OF THE VOLUME.

PUBLISHED AT THE OFFICE OF THE GARDENERS' CHRONICLE, 5, UPPER WELLINGTON STREET, STRAND, LONDON;
AND MAY BE HAD BY ORDER OF ANY BOOKSELLER.

SPECIMEN HEATHS, AND OTHER GREENHOUSE PLANTS—THE COLLECTION OF MR. W. J. EPPS, OF MAIDSTONE.

MR. J. C. STEVENS is favoured with instructions to sell by Auction, at his Great Room, 38, King-street, Covent-garden, on TUESDAY, July 16, at 12 for 1 o'clock, the above collection of ERICAS, which is admitted to be one of the finest in the kingdom. It numbers 80 specimens, all of which are in the best possible health, dwarf, bushy, and young grown plants, and which have received the highest awards both at the Chiswick and Royal Botanic Exhibitions. All the leading and best varieties will be found included, such as aristata major, ampullacea, splendens, Massoni, Hartnellii, ferruginea, propendens, tricolor retorta, metuliæflora, &c. Also magnificent specimens of Ixora coccinea, Allamanda Schottii, Epacris miniata grandiflora, Stephanotis, Azalea, Boronia, &c., many of which, as well as of the Heaths, will be in fine perfection to exhibit through July, August, and September.—May be viewed on Saturday (some of the plants at the Chiswick Exhibition, and the remainder at the auction room), and on Monday, and Catalogues had.

FARM ESTATE AND LAND AGENCY OFFICES, ESTABLISHED 35 YEARS.

MR. HURLEY (Successor to Mr. W. Sindrey), Land Surveyor, Valuer, and Farm Agent, 62, Nelson-square, Blackfriars-road, begs to solicit the attention of Landed Proprietors, Farmers, Stewards, and others having Estates, Houses, or Farms for Sale or Letting, and those seeking such, to the facilities afforded by his offices and connexions for the disposal and obtaining the same. He will be happy to register particulars of any such property for disposal, or to let, without charge, and requests the favour of those seeking for Farms, Estates, &c., to honour him with an examination of his Register, which is always open for gratuitous inspection.

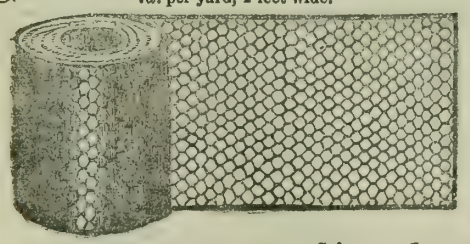
FARMS WEST OF LONDON.

MR. HURLEY, Farm, Estate, and General Commission Agent, is favoured by an extensive landed proprietor, to Let and Dispose of several really excellent Meadow and Arable Farms, near London, and a Principal Corn Market, from 50 to 500 acres, with good houses and homesteads. Rentals from 60*l.* to 700*l.* per annum. For particulars, apply at the Auctioneer's Offices, 62, Nelson-square, Blackfriars-road, London.

FARM TO BE LET.

MR. HURLEY is instructed to LET, with immediate possession, a CAPITAL FARM, situate near Kingston, Surrey, 15 miles from London, and within 3 miles of two railway stations, consisting of 110 acres of Arable and rich pasture-land, with excellent House, and numerous Farm-buildings, all in good repair. Rent, tithes, and rates included, 1*l.* per acre. There is a long lease also attached. Stock and implements to be taken by valuation.—Apply at the Estate Office, 62, Nelson-square, Blackfriars-road, London.

OXFORDSHIRE.—TO CAPITALISTS: FIRST-RATE INVESTMENT, BEAUTIFUL MANOR RESIDENCE.



MR. HURLEY is honoured with instructions by a wealthy capitalist, to SELL by private contract, one of the most beautiful compact enclosed FREEHOLD ESTATES in this county, known as the MANOR AND ESTATE OF FINMERE AND MIXBURY (either together or separate), comprising a first-rate Residence with Lawn and Carriage-sweep to the door. Picturesque grounds, &c., with good Farm Buildings, and with 228 or 469 acres of rich Meadow, Pasture, and Stock Land. The soil is deep, hedge fenced, &c. It is bounded by the river Ouse, and the best of roads. The turnpike road from Buckingham passes through the estate. Has good Lime-kiln and Brick Clay thereon. Also another House, Cottages, Yards, Buildings, &c. (This property confers the title of Lord of the Manor upon the possessor).—For Plans and further particulars of the Estate, apply at the offices, 62, Nelson-square, Blackfriars-road, London. Also (same owner) several smaller Estates to be sold in the same county, and in Bucks.—July 6, 1850.

THE MACCARONI FARM.—To be Let, from Michaelmas 1850, the above excellent Sheep Farm, the property of Lord De Mauley. Comprising a capacious Farm-house and premises in good repair, and in a central position; together with 502A. 1R. 11P. of Arable, and 29A. 2R. 37P. of Meadow Land, in the parish of Eastleach, within a ring-fence: also 17A. 2R. 13P. of Meadow Land, bordering the river Thames, by the town of Leachlade. A good road passes through the centre of the farm, which is distant from Leachlade 3, from Fairford 4, and from Cirencester 9 miles; the latter being a principal market town in the county of Gloucester.—For particulars as to rent, &c., apply to Mr. W. B. JOHNSON, of Pawlett, near Bridgewater, Somerset, and to view the Farm, to Mr. C. COSENS, of Hathcrop, near Fairford.

TO BE LET, at moderate rents, in Carmarthenshire, two genteel Residences—Dyffryn House, with three acres of Grass Land, and Careg Cenen, with from 300 to 500 acres of Arable and Grass Land, if required. Both places are within a drive of Swansea, to which the South Wales Railway is now open. For particulars, with a lithograph of Dyffryn House, apply to T. W. LAWFORD, Tirydail, Llandilo; or Messrs. ROWLAND, HACON, and ROWLAND, 38, Threadneedle-street, London.

BARNARD AND BISHOP beg to inform those friends who are likely to visit Exeter during the forthcoming Royal Agricultural Show, that the Number of their Stand is 69, where samples of their various kinds of NETTING may be seen.

GALVANISED WIRE GAME NETTING.—
7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

Foolscap octavo, 4*s.* 6*d.*

THE PRACTICAL BEE-KEEPER; or, Concise and Plain Instructions for the Management of Bees and Hives. By JOHN MILTON.
London: JOHN W. PARKER, West Strand.

INDISPUTABLE ASSURANCE POLICIES.—COPIES of the REPORT of the PROCEDURE at the last ANNUAL GENERAL MEETING of the Members, may now be had by application at the Offices of the Company.
London Indisputable Life Policy Company, 72, Lombard-street, July 6.

This Day, the Second Edition, with numerous Illustrations, price 2*s.* 6*d.*, of

USEFUL ARTS EMPLOYED IN THE PRODUCTION OF FOOD.

Uniformly with the above, with numerous Illustrations, 2*s.* 6*d.*,
USEFUL ARTS EMPLOYED IN THE PRODUCTION OF CLOTHING.
USEFUL ARTS EMPLOYED IN THE CONSTRUCTION OF DWELLING HOUSES.
London: JOHN W. PARKER, West Strand.

THE PRACTICAL GARDENER AND MODERN HORTICULTURIST; in one volume, 988 pages, closely printed, with upwards of 300 illustrated Woodcuts, containing the present improved scientific mode of managing the Kitchen, Fruit, and Flower Gardens, the Greenhouse, Hothouse, Conservatory, &c. By CHARLES M'INTOSH, C.M.C.H.S., of Dalkeith Palace. In cloth, lettered, price 21*s.*; and also with Specimens of choice Flowers, coloured, 26*s.*

"The labour and experience of a life devoted to the science of Horticulture."—*Vide Author's Preface.*

With an APPENDIX, describing a new and economical method of producing uniform Bottom-heat from Hot Water in Tanks, upon the most simple plan, with explanatory Diagrams, and Reference to Buildings now in successful operation; by which means, the "King of all Fruits," the Pine, and other tropical fruits and flowers, may be cultivated at less than half the expense of the old system.

London: THOMAS KELLY, Paternoster-row; SIMPKIN, MARSHALL and Co.; and sold by all booksellers.

This day is published, price 2*s.* 6*d.*, No. V. of

PAXTON'S FLOWER GARDEN.
Edited by DR. LINDLEY and JOSEPH PAXTON,
And Illustrated by highly finished Plates and Woodcuts.
London: BRADBURY and EVANS, 11, Bouverie-street.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

INTERESTING FACT.—The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. "Mr. A. Hermann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'Rowland's Macassar Oil,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. This fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLAND'S MACASSAR OIL.—The unprecedented success of this discovery in restoring, preserving, and beautifying the Human Hair, is too well known and appreciated to need comment. For Children it is especially recommended as forming the basis of a Beautiful Head of Hair, and rendering the use of the fine comb unnecessary. Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per bottle.

*** Each bottle of the genuine article has the words ROWLAND'S MACASSAR OIL engraved in two lines on the Wrapper; and on the back of the Wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1*s.* Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free, by return for post, by J. WILLIS, 24, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for 13 penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to Copy BRANDE'S ENAMEL Advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

GERMAN SPRING MATTRESSES, permanently elastic, very durable and cheap.

3 feet wide	£2	8	0	4 feet 6 inches wide	£3	3	6
3 feet 6 inches	2	13	0	5 feet	3	10	0

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—Under the Patronage of her Most Gracious Majesty the QUEEN. The Fourth EXHIBITION for the season will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on TUESDAY, the 23d July (open to all Exhibitors), when Prizes will be awarded for the following Productions, viz., Miscellaneous, Orchids, and Specimen Plants, Cape Heaths, Fuchsias, Carnations, Picotees, Verbenas, Roses, Cut Flowers, Fruit, and Honey. In addition to the above, the following extra prizes are offered: By J. Coppock, Esq., 5*l.*, for a collection of Miscellaneous Plants; by C. Lichner, Esq., 1*l.*, for Verbenas; by Messrs. J. and J. Fairbairn, 2*l.*, for Cape Heaths; by W. T. Iliff, Esq., for cut Indigenous Plants; by Mr. E. Denyer, of Brixton, 1*l.* 10*s.*, for Roses; by Mr. C. Turner, 3*l.*, and by Mr. N. Norman, 1*l.* 10*s.*, for Carnations and Picotees for class showing. List of Prizes and the Rules for Exhibition may be obtained from JOHN T. NEVILLE, Secretary.

Ebenezer House, Peckham, Surrey.

HANDSWORTH AND LOZELLS HORTICULTURAL SOCIETY.—The following EXTRA PRIZES (open to all England) will be awarded at the Exhibition, on the 6th of August next: 5*l.* for the best 24 Carnations; 5*l.* for the best 24 Picotees; 5*l.* for the best 24 Verbenas, single trusses. 10*s.* Entrance Money will be charged for each collection, for the purpose of forming Second and Third Prizes.

Exhibitors must give notice to the Secretary, on or before the 23d inst., as no entries will be received after that date.

CHAS. JAS. PERRY, Honorary Secretary.

Handsworth, near Birmingham, July 13.

NEW LATE STRAWBERRY, WILMOT'S "PRINCE ARTHUR."

J. WILMOT, in offering this new variety of STRAWBERRY to the Public, is confident that it combines qualities which no other kind at present in cultivation does possess, being of delicious flavour, and coming in after the principal Strawberry season is over. It possesses the property of firmness of texture, so that it may be transmitted to any part of the kingdom without sustaining injury, as it may be kept for several days after being gathered, when fully ripe, without any indication of decay or loss of flavour.

"Prince Arthur" is one of the largest sized Strawberries, and a most abundant bearer; the foliage is small, and never exceeds 6 inches in height; the fruit is consequently fully exposed to the sun. Its dwarf habit requires it to be planted not more than a foot apart. The fruit is perfectly formed, of a rich scarlet, and colouring equally all over the berry. If planted at the distance recommended it will produce double the weight per acre of any other variety.

Strong plants will be ready for sale in September next, at 5*l.* per 100, on prepaid application only, to JOHN WILMOT, Isleworth, Middlesex; Robert Glendinning, Chiswick Nursery; William T. Atwood, Mortlake, Surrey; George Charlwood, Seedsman, Covent-garden; and Messrs. Hurst and M'Mullen, 6, Leadenhall-street, London.—Isleworth, Middlesex, July 13.

CARNATIONS AND PICOTEES.—Grand Trial Exhibitions for Northern *versus* Southern raised varieties. Fifty Prizes—70*l.* value.—Schedules for the above Exhibitions may be had upon application to Mr. John Keynes, Salisbury; Mr. John Holland, Middleton; Mr. W. Bragg, Star Nursery, Slough; Messrs. T. Scholefield and Son, Knowsthorpe, near Leeds; Mr. J. F. Wood, Midland Florist, Nottingham; Mr. C. Turner, Royal Nursery, Slough; Mr. T. Dobson, Worton Cottage, Isleworth; Mr. E. S. Dodwell, Derby; the Office of this Paper; and Mr. J. Edwards, Treasurer, Wace Cottage, Holloway.—The Southern Exhibition will be held at the Royal Nursery, Slough, on Thursday, July 25; the Northern in the County Hall, Derby, on Wednesday, August 7.

Subscriptions received by any of the above-named parties.—Each Exhibition is open to all England.

CARNATIONS AND PICOTEES.—By an error of the Printer (and not discovered until the Schedules had been freely distributed), the line for the division of NORTH from SOUTH is given LYME REGIS (which is in Dorsetshire), instead of LYNN REGIS, Norfolk.

Intending Exhibitors, Raisers, and the general Carnation-loving Public will please to bear in mind, that Condition 1 (see Schedule), should read, "That a line commencing at Pembroke and ending at Lynn Regis, Norfolk, be the line separating North from South."

JOHN EDWARDS.

SELECT CINERARIA SEED, WARRANTED FROM THE BEST NEW SHOW FLOWERS ONLY.

WM. HOPWOOD begs to inform the lovers of Floriculture that he has saved from his choice Collection of 1850 (which took all the first Prizes at the Cheltenham Show), some CINERARIA SEED, of excellent quality, which he begs to offer for sale in packets of 2*s.* 6*d.* and 5*s.* each. If sown soon the Plants will be strong enough to flower early in 1851.—Agents, HURST and M'MULLEN, Seedsmen, 6, Leadenhall-street, London.—Jersey Garden, Hewlett's-road, Cheltenham, July 13.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD SUSSEX.

WM. WOOD AND SON'S extensive collection of ROSES is now in fine bloom, and will continue during the season. An idea of the extent may be formed when it is stated that Forty thousand Standards may be seen flowering in one bed; also many Thousand Dwarf, Dwarf Standard, and Standard Roses, covering many acres of ground.

Coaches run (each way daily) from Brighton to Tunbridge Wells, one of which passes through Maresfield, and within five minutes' walk of the Nursery.—July 13.

EDWARD DENYER, NURSERYMAN, Loughborough-road, Brixton, within three miles of London, informs his kind patrons in general that his unrivalled Collection of ROSES, reaching to nearly 1000 varieties, are now in bloom and free to the inspection of all visitors, Sundays excepted. Orders taken at this time and executed in November next. Price of Standard Roses, 15*s.* to 20*s.* per dozen. Fruit Trees, &c., &c.

E. D. informs his friends that he has no Seed Shop in London.

KNIGHT AND PERRY, having for so many years devoted unusual attention to the collection of HARDY ORNAMENTAL TREES AND SHRUBS, and having, four years since, purchased a large extent of ground, specially for their growth and increase (and that of Fruit trees), have now the honour to inform their patrons that their efforts have been very successful, and that they are enabled to offer many kinds of particular beauty and utility. As the character of the foliage of those which are deciduous may be best seen at this time, they respectfully INVITE AN INSPECTION of their collection, from which the following are selected from among many suitable for the embellishment of the Park and Pleasure-ground.

ACER PSEUDO-PLATANUS AUREA.—A strong-growing tree, producing variegated leaves as much as 8 inches across.

ACER PLATANUS DISSECTUM.—The very elegant, deeply cut foliage of this fine tree renders it very desirable.

ACER PSEUDO-PLATANUS PURPUREA.—This noble Maple, from its fine shaded purple foliage, will soon be in great request.

CRATÆGUS GRANDIFOLIA.—A very handsome large-leaved kind, well calculated for the park.

FRAXINUS.—Richardii, pallida, pannosa, jaspidea aurea, verticillata.—The Ash is not generally an admired tree, but these five kinds being so very ornamental, may be strongly recommended for park scenery.

ULMUS.—Pulva macrophylla; emarginata, decidedly the handsomest variegated tree we are acquainted with; cucullata, nemoralis, siberica; purpurea—this remarkable Elm, when properly introduced into park scenery will be found an invaluable adjunct to the landscape.—The Elm being so favourite a tree in this country, there is little doubt but that the preceding kinds, all of which are remarkable for their beauty, will be much sought after by planters.

PYRUS.—Sorbus terminalis, prunifolia rosea, malus aurea.—The foliage of these Pyrus is very attractive.

ROBINIA HISPIDA ARBOREA.—This excellent kind far exceeds in beauty the well-known Rose Acacia.

ÆSCULUS CALIFORNICA.—Said by Mr. Hartweg to be one of the most ornamental trees he met with in California.

QUERCUS MIRBECHII.—A very handsome species, for whose introduction we are indebted to the Russians.—Our collection of Oaks is very extensive.

Besides the above, many others equally meritorious might be enumerated; as, however, they invite an inspection of them, they refrain from doing so.

Exotic Nursery, King's-road, Chelsea, near London.

MAYLE'S MODEL FUCHSIAS FOR 1850.—No grower can expect to win a prize at any of the principal exhibitions in town or country without these magnificent reflexed varieties.

Messrs. MAYLE and Co. will send out their SEVEN NEW FUCHSIAS on the 20th June, extra strong plants. From the very high opinions expressed of their merits by Dr. Lindley, Mr. Glenny, &c., they require no further comment from us. They are the things of the season, and must be had by all who wish to keep pace with the times.

No. 4, DIADEM, was shown at Walsall, near Birmingham, with two blooms, May 8th, and was awarded an extra prize. Judges' opinion: "By far the best ever raised."

Also first prize at Wolverhampton, May 25, against some fine older specimen varieties; and first-class certificate awarded at the Birmingham and Midland Society on the 20th.

Those in bloom were exhibited at Chiswick and Regent's-park June shows. The earliest orders will secure the strongest plants. Circulars can be had. Also Mr. Hoyles' superb Geraniums, a few extra strong blooming plants being left.

Stove, Greenhouse, Bedding Plants, &c., including every novelty of the season.—105, New-street, Birmingham.

NEW GLOXINIAS.—ALBA GRANDIFLORA.—A good white Gloxinia has long been a desideratum in this much admired genus, and YOUELL and Co. have the pleasure to announce that they are in possession of the entire stock of the above beautiful variety. The flowers are considerably larger than G. maxima, measuring from 2½ to 3 inches across, of the purest white and wax-like appearance and consistency, forming a lovely contrast with its dark luxuriant foliage. It has been submitted to the Editor of the Gardeners' and Farmers' Journal, and most favourably noticed in that paper of the 13th of October, 1849. Price 10*s.* 6*d.* per plant.

SPECTABILIS.—A very robust variety, possessing the novelty so much prized in Fyfiana, producing erect flowers, which it throws well above the foliage in a compact mass, displaying the beautiful marking of the throat. Colour bright violet on the outside, the inside shaded with deep purple, fading off to a white throat, elegantly spotted. Price 7*s.* 6*d.* per plant.

PULCHERRIMA.—A very nice variety, most profuse bloomer, colour on the outside light blue, inside a rosy purple, curiously speckled with brown. Price 5*s.* per plant.

YOUELL AND CO. are now sending out strong well established plants of the above in pots, or per post free in tin cases. One set over to the Trade when two are ordered. They have also an extensive stock of all the best Gloxinias sent out last year, which they are enabled to supply in fine strong plants, at 12*s.* per dozen.—Royal Nursery, Great Yarmouth.

TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL AND Co. are now prepared to execute orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, at the following prices:

50	best new sorts	25*s.*
25	ditto	15*s.*
12	ditto	9*s.*

Well established in small pots, or by post free.

NEW DWARF CHINESE OR LILLIPUTIENNE CHRYSANTHEMUMS.

This new and beautiful class are well deserving the attention of cultivators from their exceeding dwarf habit (not attaining more than 1 foot in height). The profusion of flowers with which they are covered, as well as the great variety and distinctness of colour, will render them general favourites. Strong plants for autumn blooming are now ready for sending out at the following prices:

9	fine varieties sent out last year (for the first time) for	9*s.* 0*d.*
13	do. raised by M. Lebois (and sent out for the first time this season), for	30 0

One sent over to the Trade when two are ordered.

The latter are figured in the last December Number of the "Annales de la Societé d'Agriculture et de Botanique de Gand," and are perfect gems, engravings of which may be seen at YOUELL and Co.'s Nursery.

Descriptive Catalogues of the above may be had on application. Printed directions of their successful and easy method of cultivating the Chrysanthemums for exhibition, &c., will be forwarded with all orders.—Royal Nursery, Great Yarmouth.

LARGE SPECIMEN GREEN AND VARIEGATED ORANGE AND LEMON TREES.

MESSRS. PAMPLIN AND SON have for Sale, at their Nurseries, Lea Bridge-road, Leyton; and Woodstreet, Walthamstow, Essex, 10 Plants of the above, from 6 feet to 10 feet high, which may be seen on application.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

G. BASSIL, Pheasantry, Hemel Hempstead, Herts, within one mile of the Boxmoor station, on the London and North-Western Railway. Orders now taken for Poults, having a large quantity bred under his own special care.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

HALLIMAN'S REGISTERED FRUIT PROTECTORS.—This Glass placed over Fruit on the common wall (sooner the better) assists Nature, in our cold climate. The Fruit grows to a larger size, and its richness is increased. All orders J. P. is favoured with will be forwarded, with printed directions for use, at the lowest possible price, for ready money. Flint Glass, 4 inches, for Peaches, 9*s.* per dozen, 3*l.* 10*s.* per 100; 6 inches, for Grapes, 13*s.* per dozen, 5*l.* per 100.

JAMES PHILLIPS and Co. beg to say they have purchased the above Registry of Mr. HALLIMAN, and caution all persons from making or selling the same without their consent. Supplied wholesale and retail at 116, Bishopsgate-street Without.

EDWARD BECK, SLATE WORKS, ISLEWORTH. SLATE CISTERNS, &c.; COLE'S PATENT.

E. BECK informs Horticulturists and the Public generally that Mr. COLE has granted him the use of his Patent for the unexpired term, and he is now able to supply SLATE CISTERNS fastened without iron bolts or the usual oil cement, thereby doing away with the difficulty which has hitherto existed of forwarding such articles by rail or waggon, fixed and ready for use instead of in pieces, as heretofore.

E. B. will be happy to answer any inquiries as to the price of Cisterns, or any other Slate articles manufactured by him, such as Orange Tubs, Plant Boxes, Tanks, Shelves, Garden-path Edging, Hot-water Tank Covers, Flower Boxes for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c., all of which may be seen in use at Worton Cottage, Isleworth, on application to the Gardener, Sundays excepted.

Estimates given for Work as shown upon Drawings, and in specifications. A large stock of Slate Slabs of all sizes and thicknesses, kept on sale.

N.B.—Dairies fitted either with Shelves or Milk Pans, of very neat appearance.

PIMLICO SLATE WORKS.—Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS'S Works in North Wales.

ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.

ROYAL BOTANIC GARDEN, REGENT'S PARK.

EXHIBITION, JULY 3, 1850.

To Mr. Taylor, Gardener to E. Coster, Esq., for correct Labels in first class
To Mr. Smith, Gardener to J. Anderson, Esq., The Holme, for the same
To Mr. Wood, Nurseryman, Norwood, for 12 Alpines
To Mr. Parker, Gardener to J. H. Oughton, Esq., for 6 Cape Pelargoniums
To Mr. Cole, Gardener to H. Colyer, Esq., for 6 Cape Heaths
To Mr. Williams, Gardener to C. B. Warner, Esq., for 30 British Ferns
To Mr. J. Willmot, Nurseryman, Sunbury, for 12 Carnations
To Mr. Turner, Nurseryman, Slough, for 12 Picotees
To the same, for 12 Pinks
To Mr. S. Treacher, Wycombe, Bucks, for 24 Pansies
To Mr. Gaines, Nurseryman, for 6 Calceolarias
To Mr. Robinson, Gardener to J. Simpson, Esq., for 6 Fuchsias
To Messrs. Paul and Son, Nurserymen, Cheshunt, for 100 Cut Roses
To Mr. Terry, Gardener to Lady Pullen, Herts, for 50 Cut Roses
To Messrs. Lane and Son, Nurserymen, for 12 new Roses
To the same, for 12 single blooms
To Mr. Moffatt, Gardener to the Duke of Newcastle, for a Providence Pine-apple
To Mr. Bray, Gardener to E. Lousada, Esq., for Ripley Queen
To Mr. Fleming, Gardener to the Duchess of Sutherland, for the same
To Mr. Barnes, Gardener to R. Hanbury, Esq., for a Green-fleshed Melon
To Mr. Bennett, Gardener to J. Smith, Esq., Dulwich, for 3 dishes of Grapes
To Mr. Turnbull, Gardener to the Duke of Marlborough, for 12 lbs. of Grapes
To Mr. Henderson, Gardener to Sir G. Beaumont, for a dish of Black Grapes
To Mr. Frost, Gardener to the Right Hon. — Granville, for the same
To Mr. Taylor, Gardener to E. Coster, Esq., for the same
To Mr. Moffat, Gardener to the Duke of Newcastle, for a dish of Muscat Grapes
To Mr. Turnbull, Gardener to the Duke of Marlborough, for the same
To Mr. Cox, Gardener to J. Tradwell, Esq., Leigham-court, for a dish of White Frontignan Grapes
To Mr. Smith, Gardener to A. Anderson, Esq., Norwood, for the same
To Mr. Smith, Gardener to J. Anderson, Esq., Regent's-park, for Vines in pots
To Mr. Slowe, Gardener to R. Baker, Esq., Bayfordbury Park, for 4 dishes of Peaches
To Mr. Munro, Gardener to Mrs. Oddie, for 4 dishes of Peaches
To Mr. Turnbull, for 2 dishes of Nectarines
To Mr. Lydiard, Market Gardener, Bath, for 4 dishes of Strawberries
To Mr. Bray, Gardener to E. Lousada, for Tropical Fruit
To Mr. Ivison, Gardener to the Duchess Dowager of Northumberland, Sion House, for Tropical Fruit
To Mr. Speed, Edmonton, for 10 Stove and Greenhouse Plants

BRONZE MEDAL.

To Mr. Dennett, Gardener to W. H. Gilliat, Esq.
To Mr. Kinghorn, Gardener to Earl Kilmorey, for Leschenaultia arcuata
To Mr. Loddiges, Nurserymen, Hackney, for Saccolabium Blumii
To Messrs. Rollisson and Son, Nurserymen, for Ipomœa limbata
To the same, for Magnolia fragrantissima
To the same, for Thyrsacanthus bracteolatus
To Mr. E. Henderson, Nurseryman, Wellington-road, for Hemiandra pungens
To Messrs. Rollisson and Son, for correct Labels in Class 2d
To Mr. Turner, Nurseryman, Holloway, for 12 Alpines
To Mr. Williams, Gardener to C. B. Warner, Esq., for 12 Exotic Ferns
To Mr. Smith, Gardener to J. Anderson, Esq., for 30 British Ferns
To Mr. Newball Powis, Woolwich, for 12 Carnations
To the same, for 12 Picotees
To Mr. Bragg, Nurseryman, Slough, for 12 Pinks
To Mr. Kimberley, Pinley, Coventry, for 24 Pansies
To Mr. Francis, Nurseryman, Herts, for 100 cut Roses
To Mr. Parson, Gardener to A. George, Esq., Ponder's End, for 50 ditto
To Messrs. Paul and Son, Nurserymen, Cheshunt, for 12 new Roses
To Mr. Barnes, Gardener to R. Hanbury, Esq., Poles, for 12 single blooms
To Mr. Jones, Gardener to Sir J. J. Guest, Dowlais House, Glamorganshire, for a Ripley Queen Pine-apple
To Mr. Spence, Gardener to the Marquis of Lansdowne, for a Green-fleshed Melon
To Mr. Watson, Gardener to Mrs. Tradwell, Norwood, for the same
To Mr. Fleming, Gardener to the Duchess of Sutherland, for a dish of Black Grapes
To Mr. Lushey, Gardener to J. Hill, Esq., the Rookery, Streatham, for ditto
To Mr. Gerrie, Gardener to Sir J. Cathcart, Cooper's-hill, for a dish of Black Grapes
To the same, for a dish of Figs
To Mr. Foggo, Gardener to the Marquis of Abercorn, for 2 dishes of Nectarines
To Mr. Moffatt, Gardener to the Duke of Newcastle, for ditto
To Mr. Parker, Gardener to J. H. Oughton, Esq., for ditto
To Mr. Snow, Gardener to Earl de Grey, Wrest-park, for a dish of Cherries
To Mr. Kimberley, Pinley, Coventry, for 4 dishes of Strawberries
To Mr. Williams, Gardener to C. B. Warner, Esq., for a collection of 9 Lycopodiums
To Mr. Reekie, Gardener to Lady Hunter, for a collection of 14 Nectarines
To Mr. Munro, Gardener to Mrs. Oddie, for a large collection of Peaches and Nectarines
To Mr. Wigan, Clare House, East Malling, for 50 British Plants

CERTIFICATE OF MERIT.

To Mr. Green, Gardener to Sir E. Antrobus, for Rondeletia speciosa
To Mr. Kinghorn, Gardener to Earl Kilmorey, for Tremandra verticillata
To Mr. Glendinning, Nurseryman, Chiswick, for Achimenes Tagwelliana
To Mr. Mylam, Gardener to S. Rucker, Esq., for correct Labels, in Class 1st
To Mr. Blake, Gardener to J. H. Schröder, Esq., for correct Labels, in Class 2d
To Mr. Green, for 6 Cape Heaths
To Mr. Dennett, Gardener to W. H. Gilliatt, Esq., for 6 ditto
To Mr. Taylor, Gardener to Sir E. Coster, for 6 ditto
To Messrs. Rollisson and Son, Nurserymen, for a seedling Heath, "Gemmifera elegans"
To Mr. Willmore, Nurseryman, for 12 Picotees
To Mr. Edwards, Holloway, for 12 Pinks
To Mr. Keynes, Salisbury, for 12 ditto
To Mr. Gerrie, Gardener to Sir J. Cathcart, for a Green-fleshed Melon
To A. Rowland, Esq., Lewisham, for 50 cut Roses
To Mr. Munro, Gardener to Mrs. Oddie, for a Green-fleshed Melon
To Mr. Wier, Gardener to — Hodgson, Esq., for a Scarlet-fleshed ditto
To Mr. Mackintosh, Burghley, Stamford, for a dish of Black Grapes
To Mr. Barnes, Gardener to R. Hanbury, Esq., Poles, for a dish of ditto
To Mr. Hunt, Gardener to — Herbert, Esq., for a dish of Black Grapes
To Mr. Turnbull, Gardener to the Duke of Marlborough, for ditto
To Mr. Hyde, Gardener to H. Yeoman, Esq., Oak-hill, Wanstead, for ditto
To Mr. Davis, Market Gardener, Oak-hill, for ditto
To Mr. Cuthbert, Nurseryman, Wier-hall, Edmonton, for ditto
To Mr. Jackson, Gardener to — Beaufoy, Esq., South Lambeth, for ditto
To Mr. Watson, Gardener to Mrs. Tradwell, Norwood, for Vines in pots
To Mr. Munro, Gardener to the Earl of Clarendon, Grove-park, Watford, for 2 dishes of Nectarines
To Mr. Kemp, Gardener to Mrs. Grillion, East Acton, for a dish of White Cherries
To Mr. Gainsford, Market Gardener, Brentford, for ditto
To Mr. Meyers, Boston-road, Brentford, for ditto
To Mr. Wills, Chichester, for 4 dishes of Strawberries
To Mr. Knevett, Market Gardener, Isleworth, for the same
To Mr. Williams, Gardener to J. P. Lenhouse, Esq., Maryport, for fruit of Stephanotis floribunda
To Mr. Croxford, Gardener to H. Barnes, Esq., for 12 Gloxinias
To Mr. Turner, Nurseryman, Slough, for "Sappho," a seedling Pink
To the same, for "Huntsman," ditto
To Mr. Wood, Nurseryman, Norwood, for 30 variegated plants
To Mr. Hunter, Gardener to N. Clifton, Esq., Islington, for 3 Cucumbers
To Mr. Willmot, Market Gardener, Isleworth, for a dish of Strawberries
To Mr. Smith, Nurseryman, Hornsey-road, for 24 cut Verbenas
To Mr. Munro, Gardener to Mrs. Oddie, for 4 dishes of Strawberries

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, July 13.

50,000 CAMELLIAS WITH FLOWER BUDS.

JOSEPH BAUMANN, NURSERYMAN, Ghent, Belgium, begs to offer the following CAMELLIAS:

100	Camellias in 100 varieties, 1 foot high	...	...	£7	0	0
100	,, 50 ,,	do.	...	6	0	0
100	,, 100 ,,	from 1 to 2 feet high	...	10	0	0
100	,, 50 ,,	do.	do.	9	0	0
100	,, 100 ,,	from 2 to 3 feet high	...	12	0	0
100	,, 50 ,,	do.	do.	11	0	0
100	,, 100 ,,	from 3 to 4 feet high	...	16	0	0
100	,, 50 ,,	do.	do.	15	0	0

J. B.'s Camellias are of the best cultivation. A liberal discount to the Trade; see J. B.'s Catalogue.

MESSRS. KNIGHT AND PERRY feel themselves called upon to thank their numerous patrons very gratefully for the confidence with which they have recurred to them when in want of Gardeners, and beg respectfully to say that the scrutiny and vigilance they have always employed in selecting good and clever men (to which the almost invariable satisfaction that has so long attended their recommendations is mainly attributable) is, if possible, increased now; and the steps they have taken to arrive correctly at the professional and private character of those they send out as GARDENERS, FORESTERS, BAILIFFS, &c., induce them to undertake unhesitatingly to furnish first-rate men in these capacities whenever called on to do so.

EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON.

BECK'S SEEDLING PELARGONIUMS of 1849.
For prepayment only, the first remittance to secure the first selection. Post-office orders are requested to be made payable at Brentford.

ROSA.—A bright rose-coloured flower of great smoothness and good form, a free bloomer, constant, and of excellent habit. Will prove a first-rate variety for all purposes. 30*s.*

MAJOR DOMO.—A very large rose-coloured flower, with dark clouded top petals; some of the blooms here measure 3 inches in circumference; free bloomer, and of strong habit. 21*s.*

SILK MERCER.—A very close compact-growing variety, free bloomer, and very constant; smooth silky flower of first-rate quality, ground colour rose, with deep maroon blotch on the upper petals. 21*s.*

PRINCE ARTHUR.—A medium-sized flower of excellent quality, very constant, and a free bloomer; rosy crimson ground colour, with dark well defined blotch on the upper petals, leaving a bright distinct margin; light centre. 21*s.*

DIANA.—This is very similar to Rosalind, but larger, and is at its best early in the season, whilst the latter variety is not at its best until quite late. 15*s.*

TYRIAN QUEEN.—If the large deep mulberry-coloured top petals of the flower had been matched with as good lower ones, it would have been first-rate; strong robust habit, and a free bloomer; a very distinct and constant variety. 15*s.*

Many other Seedlings might have been selected, such as "Little but Good," and others, but they have exhibited faults which make it necessary to try them another season. Incomparable will not be sent out until 1851. At present it is unequalled.

VARIETIES OF 1848.

CUYP.—A novel claret-coloured flower; soft, silky, cloudy blotch on upper petals, shading off to the margin; very free bloomer and constant. 10*s.* 6*d.*

EMILY.—A very fine large Centurion flower, of first-rate character for the home or exhibition stages, being a very free bloomer; quite constant, and of good habit. 10*s.* 6*d.*

GOVERNOR.—A most profuse bloomer, of a rich glowing purple, stiff in the petals, and well adapted for all purposes. Good habit and foliage. 10*s.* 6*d.*

LOVELINESS.—A striking flower, of excellent quality; a rose-coloured clean distinct crimson spot on the bottom petals gives it a decided and pure white eye, upper petals rich dark spot extending evenly upwards, and abruptly shading off into the edge; habit excellent. 10*s.* 6*d.*

PAINTER.—Novel and striking, from the great amount of colour on the lower as well as on the top petals; very free bloomer, and constant. 10*s.* 6*d.*

PET.—A middle-sized, stiff, smooth flower, of high quality; rich, dense, even-coloured top petals, with a very light and well defined edge, white eye, and pale rose lower petals; moderate bloomer and constant. 10*s.* 6*d.*

ROSALIND.—A large-sized fresh-coloured flower, a glowing crimson upper petal, with dark blotch; a large white centre, and lower petals light rose; free bloomer, constant, and good habit. 10*s.* 6*d.*

Foster's Gipsy Bride and Constance, 10*s.* 6*d.* each.
Foquett's Magnificent, 10*s.* 6*d.*; and Symonds' Field Marshal, 10*s.* 6*d.*

OLDER VARIETIES, AND OTHER RAISERS' FLOWERS.
Twelve of the following varieties, including the box and carriage to London, will be sent out in October, for Two Guineas, well rooted in 3-inch pots, and ready for an immediate shift into a larger size:—Blanche, Centurion, Cassandra, Crusader, Delicatissima, Dorcas, Emilia, Gustavus, Gulielma, Lalla Rookh, Lamartine, Mont Blanc, Meleager, Minna, Ondine, Princess Alonzo, Ruby, Rosamond, Star, and Symmetry.
Any twelve of the above are fit to compete at any exhibition, metropolitan or provincial. J. Dobson has invariably taken the first prizes at the great metropolitan exhibitions with the sorts herein advertised.
Worton Cottage, Isleworth, Middlesex.

"THE FLOWER OF THE DAY" IS
LEE'S NEW VARIEGATED SCARLET GERANIUM.—This fine bedding plant is very vigorous, and the variegation perfectly constant. The foliage is bright green, beautifully margined with silver, with a light horse-shoe, and an occasional pink tinge. The trusses are large, of a light scarlet (the most conspicuous colour), and the general effect it produces is elegant beyond description.
"THE FLOWER OF THE DAY" may be seen in bloom at Lee's Nursery during the present month. On the 1st of August good established plants will be ready for delivery at 10*s.* 6*d.* each, with the usual allowance to the trade when three or more are ordered. Orders will be executed strictly in rotation.—Address, J. and C. Lee, Nursery and Seedsmen, Hammersmith, near London.—July 13.

The Gardeners' Chronicle.
SATURDAY, JULY 13, 1850.

MEETINGS FOR THE ENSUING WEEK.
Wednesday, July 17—Royal Botanic ..... 3*h.* P.M.
Country Shows.—Wednesday, July 17: Stamford Hill Horticultural.—Wednesday, July 17, and Thursday, July 18: Devon and Exeter Botanical and Horticultural.—Thursday, July 18: Birmingham Botanical and Horticultural.

It is a very general opinion amongst those who have paid most attention to the Potato disease both in this country and on the Continent, that two distinct diseases have often co-existed in the same plant or tuber, and doubtless many of the conflicting statements which have been put forth on the subject have derived their origin from this circumstance. Some, for instance, have asserted positively that the disease always commenced in the leaves; others, as undoubtingly, that the under-ground portion of the stem was the first to be attacked. Both opinions were probably right, but a different disease was the subject under investigation. We believe that during the last week a case has occurred to us illustrative of this subject.

Without making any assertion as to the origin of these affections, it may be assumed as a pretty well established fact that the two diseases in question are characterised during some period of their development by the presence of a peculiar parasitic fungus, the true Potato murrain by Botrytis infestans, and the other form of decay by Fusarium Solani; and it was stated by Mr. Berkeley, in his memoir on the Potato murrain in the "Journal of the Horticultural Society," that he believed that a little mould, figured under the name of Dactylium tenuissimum, was the young state of the Fusarium, the Dactylium being very generally present in the same tuft with the Fusarium, both in British and foreign specimens, and the one, notwithstanding the great difference between extreme forms, running by imperceptible gradation into the other. The moisture of the last few days has favoured the development of moulds in a very marked degree, and every plant of Ash-topped Potatoes in our garden exhibits unequivocal marks of disease, in every case accompanied by the little Dactylium. The portion of the stem near the tubers is blotched with brown spots, which enter deeply into the substance, so that not above half the cells are in a condition to carry on the circulation. These spots soon spread to the strings, which are already greatly injured, and from thence to the surface of the tubers, which are brown and discoloured, though the decay is at present merely superficial. Upon the spots, whether on the tubers, strings, or base of the stem, the delicate white mould is distinctly visible, and the same mould is also present on the old sets.

It is to be observed that the affection is entirely distinct in appearance from that of the genuine Potato murrain in its earliest stages, and would at once be pronounced to be so by any of our peasants. We cannot state positively that this is the commencement of the second form of Potato disease to which we have alluded, as our observations have not been carried out to the full development of the affection; all we assert is that a malady, distinct from the Potato murrain, does exist amongst Potatoes, and evidently one of a serious nature, as every malady must be which destroys the tissues on which the perfect development of the plant and tuber mutually depends, and that this disease commences not in the leaves but in the lowest part of the stem. Some months may pass before the affection runs through its course, but we shall watch its progress with interest, in the hope of gaining some positive information on the subject.

A correspondent assuming the strange signature of Doubll Yew has sent us a Monstrous Foxglove, of one of whose flowers the following is a representation, of the natural size. We notice it thus pro-

minently, because the example shows that double Foxgloves, Snapdragons, and such plants, are not so unlikely to be obtained as is generally supposed.

The terminal flowers alone, we are informed, were like this; the lateral flowers are represented as having been in the usual state. But it is by no means improbable that seeds saved from those lateral flowers would produce plants having a still greater tendency to become double; and by repeated sowings it is quite within the bounds of possibility that a race of Foxgloves may be secured with the same property of coming double that we now see in the common Ten-weeks Stock. If that could be accomplished it will, we think, be admitted that, considering the extraordinary size of these flowers, a very striking ornament would be added to the flower garden.

In a merely scientific point of view the structure of the monster in question was sufficient to establish all the main points of morphology. It showed that a flower is a branch; that irregular flowers will occasionally become regular; and that, becoming so, they make up for all the deficiencies and peculiarities of the ordinary structure, by taking on the customary state of regular flowers; that all the parts of a flower are leaves in various states of development; and that the axis of a flower is a growing point, capable of indefinite extension as soon as the forces which determine the production of a flower are disturbed.

What we found was as follows:

Firstly, a calyx consisting of 12 sepals, distinct to the base. Secondly, a corolla as large as the Hebe's Cup Rose, lobed with considerable irregularity; deep rich rose, with the peculiar ocellated spots of Digitalis. Near its base were 12 perfect stamens. Thirdly, another calyx, regular, cup-shaped, with 13 short triangular teeth. Fourthly, within this a second corolla, paler, with purple not ocellated spots, almost hemispherical, very irregularly lobed, in three irregular whorls, with 11 stamens in a more or less monstrous state. Fifthly, in the midst, a lengthened axis covered with numerous leafy, petal-like, or stamen-like lobes, forming a confused tuft. No pistil; but all sorts of transitions from stamens to scales and leaves.

We regret to announce the death of the Rev. William Kirby, M.A., Rector of Barham, Suffolk, at that place, where he had resided 68 years, on Thursday, July 4, in the 91st year of his age.

Mr. Kirby was Honorary President of the Entomological Society of London, President of the Ipswich Museum, and Fellow of the Royal, Linnean, Zoological, and Geological Societies, besides being honorary member of several foreign societies, and has left behind him an imperishable name as one of the first entomologists of this or any age. This title he would have assured to himself had he written no other work than his "Monographia Apum Angliæ," published in 1801, in two volumes, 8vo, in which, from materials almost wholly collected by himself, and the plates of which were mostly etched by his own hand (having taken lessons in the art for this express purpose), he described upwards of 200 of the wild bees of this country, with a largeness and correctness of view as to their family (or as they are now considered, generic) divisions, that excited the warmest admiration of British and foreign entomologists. But when to this great work we add his other entomological labours—his numerous and valuable papers in the "Transactions of the Linnean Society;" the "Introduction to Entomology," written in conjunction with Mr. Spence; the entomological portion of his Bridgewater Treatise "On the History, Habits, and Instincts of Animals;" and his description (occupying a quarto volume), of the Insects of the "Fauna Boreali-Americana" of Sir John Richardson; it will be evident how largely and successfully he has contributed to the extension of his favourite science; and all this without encroaching in the slightest degree on his professional or social duties, for, while ranking so high as an entomologist, he was during his long life a most exemplary and active clergyman, beloved by his parishioners of all ranks, and one of the warmest of friends, and most simple-minded, kind-hearted, and pious of men.

Mr. Wheeler has made a very fair reply to our complaint of the proceedings at the late meeting of the Gardeners' Benevolent Institution. He admits that "votes should in general be given to candidates who have subscribed to its funds," but he thinks Beach an exception to the rule, and he objects to the principle of rendering it compulsory upon subscribers to vote in that manner.

We entertain no doubt that Beach was a very proper person to elect, if merits or sufferings are alone to be considered; but so are we bound to presume were those who failed. Their merits and sufferings probably gave them the same claim upon the funds as his, and their subscriptions gave them a further claim. It is that for which we contend. If the charity were rich we would throw the doors open as wide as possible; but when we see half a dozen candidates for every vacancy, and know that the funds cannot be distributed to a greater extent, then we must refer to the old adage that charity begins at home, and insist upon the prior claim of those now rejected. Surely common prudence tells us that if a charity is to be supported by gardeners, it must be shown that gardeners who support it are likely to gain by it; otherwise we strike away the motives that would naturally actuate them to aid its funds. It is very well to talk of philanthropy, and self-denial, and patriotism; it may be the proud boast of England that she is the country in which those virtues flourish most; and we admit their existence to a wonderful extent; but we submit that self-interest is with the mass of the world paramount to all such feelings, especially where money is in question.

That such is the case among many of those who advocate the present system of election is at least sufficiently plain. There are men among our correspondents who coolly declare that they subscribe in the hope that they may thus be able to secure a pension to some of the persons whom they happen to know. A subscription of a guinea a year is no doubt an economical way of procuring pensions of

15*l.*, by pestering and persecuting good-natured voters, but we doubt extremely whether any charity will be greatly benefited by the assistance of those who act upon such a principle.

Mr. WHEELER seems to hint that the committee are not sufficiently particular in ascertaining all particulars of the character and life of the applicant before they admit him a candidate; but in this we trust that the committee is unassailable. If it were otherwise, they would act with great injustice to the subscribers, who trust implicitly, in most cases, to the statements made in the voting papers. At least we can say that such has been our own case, for we do not remember having had the slightest knowledge of the candidates to whom we have given our votes, except in one instance. At all events, we feel sure that the discussion which has been raised will be productive of good. Mr. WHEELER's objects are the same as our own and as those of the majority of the subscribers; his suggestions deserve the attention of the committee; and we have no doubt the remarks which have been made will be found to tell at the next election.

The death of Mr. ANDREW MURRAY, announced in another column, causes a vacancy in the Curatorship of the Botanic Garden at Cambridge. It is to be presumed that the Trustees, in filling it up, will again have recourse to the system of public examination; and we shall be curious to know who will be the fortunate candidate. We cannot say that we anticipate many English competitors, for it must be owned that English gardeners are upon the whole not more conspicuous for their skill in cultivation than for their unacquaintance with Botany—that is to say with the names and distinctions of plants.

Those of them who are ambitious of securing one of the best prizes in the field of English gardening will now see the importance of attending to the advice we have so often given, that they should neglect no opportunity of making themselves acquainted with that humble kind of botany which consists in knowing the names of the plants they grow. To be ignorant of the names of common plants; not to know common plants when they see them; is, one would think, a deficiency which would by common consent be set down as disgraceful to those on whom it can be proved. Nevertheless the deficiency exists, and will continue to exist until the possession of some reasonable botanical knowledge is made a condition by those who employ gardeners. If it were settled that a man acquainted with the names of plants should be worth 5*l.* a year more than he who knows nothing about the matter, we should soon have our young gardeners at work in earnest to qualify themselves for the higher wages—and that time is quickly coming on.

ON PEAT-EARTH PLANTS.

THE plants that require peat-earth in their culture contribute vastly to the beauty of our gardens; the Rhododendrons alone are beyond all praise; their evergreen foliage and the gay colours of their masses of flower render them ornamental in the highest degree at all seasons of the year.

The other peat-earth plants, from the Azaleas, Kalmias, and Heaths, down to the tiny Sundew (Drosera), on the peaty swamp, are all so exceedingly interesting, and of such easy culture, that we never can have enough of them, and why? Because both noblemen and amateurs are unable, from want of means, to prepare the hills and dells of peat-earth really necessary to grow and flower this section of plants in perfection.

These hair-rooted plants not only require a peaty soil, but from the extremely attenuated character of their feeders, they cannot be successfully cultivated without a great proportion of sand in the compost; nay, the necessity of a sandy medium is so great, that some species which only flower and seed freely when grown in sandy peat, will live long, and even flower in very sandy loam, although all experience goes to the exclusion of common garden-earth from their culture. It is therefore clear that sand is not to be dispensed with in the cultivation of peat-earth plants, and we have only to look at the higher order of Heath growing in pots to see it confirmed.

But this is not all; for we find the first practical men of the day using a larger volume of soil or compost than their forefathers were wont to do in the culture of Heaths; and, moreover, using the greatest precaution as to drainage at the bottom of the pots, and having vegetable fibre intimately incorporated with the compost; and, lastly, but not the least important for our present purpose, a portion of mountain pebbles, frequently flint, and sometimes freestone, of the size of one's "fist," are to be found mixed with the peat soil in the pots and tubs in which the finest specimens of Heath cultivation have been exhibited.

Now, since there can be no doubt as to this being good practice in getting the finest of the tribe of Heath-mould plants to produce their flowers in the greatest profusion, let us turn it to account out of doors; for it is only by thus appealing to ideas already established, that I can hope to convince any one of the extravagant waste of expensive materials which we constantly meet with in the making of peat beds for Heath-mould plants.

The sand and stones used in the late Mr. M'Nab's compost is stated at one-third part of the volume of soil. Now, as reason and experience go to prove that a globular mass of flint, if not perfectly neutral in the soil must be very nearly so, for its surface in proportion to its solid content is the smallest surface possible, and where an infinite number of angular pieces are to be found in the compost of a similar nature, in the form of sand, the mountain pebble is, to say the least of it, a clumsy looking grain of sand when used in the soil as I have stated.

Now, although a clumsy lump of stone, occupying space in a flower-pot, would be anything but desirable if it were neutral or even nearly so, the case would be very different out of doors, and, for the reasons which I am about to state, a clumsy harmless medium becomes very desirable to fill up with; if perfectly neutral, it will do well, but if beneficial as a part of the compost so much the better.

With this view I planted out a quantity of specimen Heaths eight years ago, and in transforming the soil from common garden earth to grow specimens of hardy Heaths, it was necessary to remove the garden soil and replace it with peat, sand, and stones. This was easy enough, and required no further consideration, had it not been for the race with time to gain a given point and save a blank parterre by making it at once into a Heath garden. The compost was put in, but instead of the proportions being sand and stones one part, and peat soil two parts, it was as follows: Very fine peat reduced to powder, one-ninth part; sand, two-ninth parts; and stone (being in abundance on the spot), six-ninths of the whole mass.

Now, let it be observed that this was no novelty or experiment, for the plants were not planted in any untried medium, but in the best peat and sand, and with great depth of this peat bed to run into; and when these specimens, five years after, had to be removed to make room for alterations, it was matter of regret to put a hand to plants doing so well.

Here, then, we have data to calculate the cost of ordinary peat earth beds, as compared with this one. Soil fit for Heaths about London may be taken at 20*s.* a cart-load, but to prevent cavil we shall take it at 10*s.* per cubic yard, consequently every 4 yards of the surface of a peat bed 18 inches deep will cost 1*l.* sterling for the peat. To save this outlay all sorts of expedients are resorted to, such as adding loam to it, old tan, rotted sawdust, old spent hotbed dung, leaf-mould, &c. Now, I tried the experiment of intimately mixing loam and peat in fine powder, and planting Sage plants in the compost, and found that the peat, being a vegetable substance, was very soon gone, and the loam, like the hungry kine, had devoured it; and it is only because peat is generally mixed with loam in lumps, and not intimately incorporated as in the above case, that it remains unchanged, for if inert peat can get loam with its turfy decaying vegetable fibre, and a taste of lime in the form of marl, &c., it will go to build the nearest living vegetable, and remain no longer inert peat; no, nor "leave even a rack behind." To a person unacquainted with plant growing, nothing could be imagined more unreasonable than to try the experiment of growing choice plants in a compost of clean washed stones and clear water, yet all the propagators use it; and go where you may, the same damp silver-sand is the lightest food that is administered to the most delicate subjects. I mention this to calm the fears of those who might jump to the conclusion that my ideas of growing Heaths, &c., on heaps of stones were either new or untried; but this assuredly is not the case, and I know of no point in which the gardener is so far ahead of the agriculturist in "tilling the soil" as on this, for the farmer will "marl—mud—clay—chalk — pare — burn — bone — lime — salt," &c.; but where will you find an instance of the agriculturist taking to a sand-pit for one of the ingredients of "good husbandry?" I have weighted light land with stones for the cultivation of Strawberries, and for the purpose of retaining steep slopes in their proper shape, and have invariably found the character of the light land thus laden wonderfully improved. Scarcely a compost of any kind is made up in horticulture without sand, and seeds are seldom so well started as in a soil made firm, yet friable, with sand; but to return to the preparation of peat beds, the finest turfy peat with white sand and stones ready mixed on the moor, is very good for every purpose, and a very excellent compost, well suited to the parties whose lots are happily cast in its immediate vicinity, still the transit of such dead weights as sand and stones to great distances amounts to the prohibition of the article altogether.

The best peat or heath-mould resembles very rotten leaf-mould, and from this down to black muddy earth there are to be found peats of all grades; still the article in question, when pure, is very light—so light that no ordinary cart could contain one-half of what a horse could draw upon good roads. Now, to the parties who long for peat beds, this is indeed good news; for, by the aid of a few old guano bags, or corn sacks, such a quantity of dry peat soil, minus the sand and stones, could be carried by cart or railway luggage-truck as would delight the amateur's heart without pulling so heavily at his purse-strings as when, in addition to the peat, he used to pay for the wet in it (water), the sand in it (stones), the stones in it (stones again!), and the vegetable fibre in it (straw). Here, then, we have the articles wanted marked out to us by the most successful culture of that type of the tribe — the Heath. The vegetable matter, whether it be called heath-mould, peat, or leaf-mould, must be had; and more than half the cost of this article will, under ordinary circumstances, be saved if this, the most important ingredient can be had by itself.

The stones may very frequently be found upon the spot by digging for them, and separating the article wanted from the materials with which it may be imbedded; ordinary gravel, screened from the finer clayey particles that bind it, will be found an excellent ingredient, and when it is considered that two-thirds of the peat bed may be made up of the material from the nearest gravel pit, things will assume quite a different aspect, and hundreds may enjoy heath-mould plants now that dared not hope for such a luxury when the soil was a guinea a load to grow them in.

The article sand needs no comment, but the vegetable fibre or surface part of the peat turves may generally be manufactured at a tenth part of the cost of carting dry dirt from the moors, as compost, under the name of getting the turf or Grassy part along with it. Now this is dangerous ground to enter upon, and no doubt the sticklers for the "turf" will not yield this point quietly, for of all other practical points this of "the top spit," paring it thin, with the heath and Grass adhering, is considered as the getting the soul along with the substance of the compost in the collecting of either loam or peat.

If the surface be Grassy, the ingredient is neither more nor less than hay more or less dry, and if so, the chaff cutter will furnish you, as it has furnished me, with chopped straw or soiled hay, for the veriest trifle, to any reasonable amount for mixing with soil, and in the case of stunted heath, which, when decomposed, amounts to a very small item in the compost, it is but leaf-mould and wood; and for all practical purposes, if it were really wanted, which it is not where good peat and sand is in abundance, it might be counterfeited by mixing the ingredients of which it is composed, such as sawdust and short Grass, such as the hopper of the mowing machine will supply at a much cheaper rate than the distant moor-land.

Ordinary peat soil is so light that plants have great difficulty in taking to it after planting, and the constant complaint in cultivating American plants is the difficulty of securing a supply of water at one season without saturation or flooding at another; and when we add to this the practical difficulty of getting the wood ripened, without which no plant can flower or fruit well, we shall not fail to appreciate the value of the stones in the building of peat beds, for they give firmness where the soil would otherwise be frothy, and in their crannies hair-rooted plants find that moisture without mud which they delight in, and though firm as a rock upon the surface, the mass of stony peat will remain light and porous, moderating all excesses of heat and cold, and of wet and dryness. *Alexander Forsyth, Saint Mary's Church, Torquay, Devon, June 25.*

DISEASES OF PLANTS.

(*Continued from p. 420.*)

GENUS IV. ERGOT.—This disease, known amongst us by the several names of *Granosprone*, *Frano ghiottore*, *Fame bianca*, *Fame nera*, *Cresta di gallo*, and *Cerrone*, attacks Gramineæ, and especially Rye. Tessier has erred in supposing that Italians admit two sorts of ergot, one of those which he alludes to being a very distinct genus which we call rhachitis, and has been investigated under that name by Roffredi, as will be seen under my next genus. The *ergot* is that disease by which the grains change their form in the ear before the latter issues from the sheath. They become irregularly round, of a greenish colour. As they dry they assume a dull tawny colour, the epidermis becomes rough and brittle, and the seeds themselves have more the appearance of round berries, of different sizes, than of oblong corn grains; they are full of a fibrous, lamellar substance. I have myself seen very little of the Rye ergot, and what I have to say on the disease is chiefly taken from Ginanni's "Treatise on the Diseases of Grain," and from Tessier's work. Two species may be admitted.

First Species. MALIGNANT ERGOT. — The grain, though enlarged, retains the globular form above mentioned, and a violet colour. The interior is of a blueish grey. The flour made from it has a most nauseous smell and an acrid flavour; it gives the bread a dark, blueish hue. This is the grain that produces the *Rafania.**

Second Species. MILD ERGOT. — The external appearance is the same, but the interior of the grain is white, farinous, and without odour. It does not appear to be productive of any mischief if used as flour in bread. Whether these two forms be two different diseases or not would require further investigation; without giving way to flights of imagination, as is too often the case in the inquiry into phenomena, which for the most escape the powers of the naked eye.

On comparing all that has been written by authors, who not unfrequently confound the *rhachitis* with the *ergot*, it seems that the latter disease, although it attacks Rye in preference, is not unknown on other Gramineæ. It is also observed that in some countries, although covered with Rye fields, ergot is quite unknown. It shows itself the most in places with a southern aspect, in light sandy soils, when the spring has been hot and dry, and in autumn-sown or early-sown Rye fields. The first symptom is a shining, viscid liquor, of a sweet flavour, which covers the external as well as the internal surface of the chaff, although this

* The word is unknown to me, but I presume it to be the well known disease resulting from eating ergot Rye.—*Trans.*

liquor is not always present, nor on all the ears. At the time of flowering there are found on the ears a great quantity of minute insects resembling the small flies that swim on vinegar. At other times there are minute worms resembling little eels, of which there may be seven or eight under each scale of the chaff. Tessier has observed the great rapidity of growth of the ergot-grain; if the total length it attains be 12 lines, it will grow two in the course of 24 hours.

Ginanni, having observed that the ergot contains insects whose existence had already been shown by Needham, attributes to them the production of the ergot. Fontana, having followed the development of these insects from the egg to their perfect state, thinks that the deformed grains must be considered as of the nature of gall-nuts; he considers the disease as contagious, and he also attributes it to the insects. But having, on a subsequent occasion, repeated his observations, he did not find insects in every grain, and therefore considered the doctrine as probable only, but not established. Others attribute the disease to the vicissitudes of the seasons, or to the humidity of the soil. But none of the causes which have been assigned can account satisfactorily for the production of this singular disease. The disease being recognised as contagious, it follows that precautions must be taken against it. The first would be to pass the seed corn through a sieve, in order that the ergot grains may, from their size, remain. Steeping is the next thing; and, if humidity of soil promotes it, proper draining must, as in other cases, be resorted to.

VILLA AND SUBURBAN GARDENING.

The importance of having all plants, including fruit trees, properly named, even in small gardens, cannot be too clearly pointed out. A plant may have beautiful foliage and flowers, but without a name it yields comparatively little interest. Every plant has a history of its own, and the first step towards obtaining a knowledge of that history is its name; the next its native country and year of introduction into our gardens. A garden of plants without names is like a library of books without their exterior superscriptions. Numbers are only useful to nurserymen. All garden plants should be properly named. The season of propagation is chiefly when plants are out of bloom, and the want of diligent care in retaining their names too frequently leads to a confused nomenclature. The vast numbers of new plants which are being continually introduced, as well as the host of garden varieties every year brought under the amateur's notice, is quite perplexing to him, unless constant attention to correct labelling is observed. Then, again, with regard to fruits, how much uncertainty would be removed by keeping labels of a permanent kind to every tree. Small gardens cannot, or ought not, to find room for indifferent kinds of fruits, or uncertain bearers, hence the importance and the advantage of knowing every kind we cultivate. How much trouble is thereby avoided! for it frequently happens that the difficulty and expense of obtaining the name of a single fruit are much greater than the attention necessary in keeping the names to the small collection which the limited space of a suburban garden admits.

With respect to the particular kind of label which it is most desirable to employ, there is a good deal of uncertainty. Some persons prefer some of the new kinds now in existence, while others adhere to the old wooden label, which, after all, has not yet been very satisfactorily superseded; whatever kind of material is employed, however, the names should be accurately and distinctly written. *Pharo.*

GUANO.

Gentlemen! take care of your pockets. The manufacture of guano out of loam, which had slackened lately, is revived in full force. To one loam-hole the same waggon has twice repaired on the day when this is written.

Home Correspondence.

Drying Plants for the Herbarium.—I have drawn up the following memorandum respecting the process by which I dry plants for an herbarium, not with any impression of its superiority over other ways; but in the hope that it may suggest some useful idea, which, in more skilful hands than mine, may be turned to good account, by rendering easier the tedious task of the botanical collector; and if, in return, any of your correspondents could point out to me any improvement on this plan, I should feel much obliged. The box in which I place my fresh specimens is about 10 inches deep, 13 long, and 3½ broad, and in shape exactly resembles the leather cases sometimes used as covers to portable *secrétaires*. It is made of tin, covered with light-coloured leather, and strengthened with stiff pasteboard. The mouth of it (13 inches by 3½) is closed by a flap fastened to the front by two buckles; and straps sewn to the sides enable the collector to wear it conveniently, like a game-bag. Heat passes with some difficulty through the sides of this box. I have often carried specimens for a whole day under a broiling sun, without scarcely finding any of them drooping. As fast as I collect the plants, I press them gently down to the bottom of the box, for the double purpose of economising room, and of keeping them from injury by shaking; and in this manner I can stow away a considerable quantity in a small compass. Very few kinds of plants are injured by this treatment. As for Poppies, Glauciums, Roses, Cistuses, and other plants whose petals are very deciduous; and specimens, such as Irises, whose flowers are liable to be bruised and broken, I collect them when the buds are about to expand; and then, by placing their stalks in water when I return home, the flowers bloom in the course of a few hours, and I am able to transfer them quite fresh and uninjured to the drying sheets. If the weather is very sultry, I refresh the plants in the box with a little rinsing of water. The paper I employ in the drying process is of two kinds. One is grey or brown "filtering paper" (I believe it is so called), used by chemists and apothecaries; and the other is the thin white "copying paper," to which merchants transfer copies of their letters. I place the plants between the folds of single sheets of the white paper, alternating with four or five, or more, of the grey. The advantages of the "copying paper" are that, from its being of a different colour to the other, the collector is able to perceive at a glance the sheets containing plants, without the chance of passing any over; being semi-transparent, he can recognise nearly every plant without having to open the sheets; and, being very absorbent, the dampest sheet dries in the course of five minutes. Add to this, the further recommendation of the smoothness of its texture, a desideratum in drying delicate plants. At least once a day I change the damp grey paper, scattering it to dry, over the floor of a room. The white sheets require no changing whatever, and the plants may remain in them undisturbed until dry; except, however, in certain cases, as with some kinds of Poppy, Pæony, and Hyoscyamus, which are apt to ferment and become mouldy, and with some bulbs which adhere to the paper. The flowers of some plants (as some kinds of Iris), curl up the moment the sheet which contains them is opened, and all the care in the world will not restore them to their proper shape. Such plants must therefore not be touched until perfectly dry. I find that sheets of stout pasteboard may be used with advantage for the separation of plants that are nearly dry from those that are not so, and the delicate from the rough and thorny, &c. After submitting the plants for a day or two to considerable pressure, to flatten them effectually, I place them under a moderate weight, which I decrease as they dry. Instead of mounting my plants on half sheets, as is sometimes done, I paste them on the third page of loose whole sheets of stout white paper (the fold of the paper being on the left hand). I make use of a mucilage of gum-arabic and tragacanth, but as it injures the colour of some flowers, it should be employed discreetly. Each sheet contains solely plants of the same genus, and beneath each specimen I inscribe its technical and English names, the place where found, the date, and a number corresponding with one in my register. To facilitate reference, I write on the outside of each sheet, in the extreme left hand upper corner, the genus contained within; and as regular botanical classification involves some difficulty as to the speedy discovery of any particular genus, I find it more convenient to arrange my plants alphabetically; for instance, thus: Aconitum, Adonis, Æthionema, Agrostemma, &c. To look for a plant I merely let the corners of the sheets slip through my fingers, as if I were looking for a word in a dictionary, and I immediately discover what I require. This arrangement does not interfere at all with subsequently classing the collection when quite complete, according to any particular system desired. I preserve my mounted plants between two boards, the whole being kept together by several straps. I alluded above to my register. It is arranged in a tabular form, containing the consecutive number, date when collected, botanical and English names, colour of flower, quality, where found, nature of soil, and remarks. Under the latter head I make memoranda like the following:—"Very fragrant—climbs—parasitical on Wormwood—leaves appear after the flowers—seeds quite ripe on the 20th June—Turkish name, Kardash Kâni—cultivated—roots eaten by the natives—roots contain a red dye," &c. I find it better for travelling not to use screw presses for drying my plants, as the screws are liable to get broken or warped. I place my collection between two boards, bound together with cords; when I arrive at a station I put some heavy weights thereon, and when *en route* I stow my plants among my baggage, to protect them from the heat of the sun. *H. H. C., Erzeroom, May* 1850.

To kill Saw-fly on Roses.—Three years ago this pest destroyed nearly all the foliage of my Roses. Last year, after a great deal of mischief had been committed, I put some white Hellebore powder into a piece of muslin, and dusted the foliage of the trees with it. This proved an efficient remedy. This year it began its ravages much earlier (about a month since). I have again tried the powder with success. In applying it I take the advantage of a still evening, just when the dew begins to fall. *W. U.* [Take care that the white Hellebore powder is not spoiled by keeping.]

Change of Note in the Cuckoo.—The peculiar notes uttered late in the season are not the notes of the old bird, but the first attempts of the young birds preparatory to taking their departure. This will likewise account for the tameness of the bird, as mentioned by your correspondent. *W. H. R., Southampton.*

Are none of the less recently introduced Conifers fit for our Public Parks?—While in our day scarcely a year has passed that our pleasure gardens have not received some new and elegant feature, what, may I be permitted to ask, has been done in our public and other noted parks and forests, to keep pace with the progress that has characterised other branches of horticultural practice It is true that Lord H—— and Mr. C—— have planted everything likely to permanently embellish our landscapes, but these instances are far apart and not easily accessible. A ramble in any of the noble parks within 20 miles of the metropolis would hardly afford an instance; so that the inquiry that was recently and naturally addressed, "are none of your much-talked-of Pines fit for the forest after all?" had its origin in feelings of disappointment at finding trees of the reputed growth of 200 feet still nursed in pleasure gardens. Visit the Great Park at Windsor, pursue the search from one end to the other, "splendid capabilities exist," but there will not be found a single touch from a landscape painter of the modern school; noble evidences of the genius of the old masters are to be found on every side—stately Oaks, wide spreading Beech, noble Elms, all framed with magnificent avenues; but we seek in vain for the delicate refreshing green of such Pines as insignis, now an old friend amongst us. What a fine effect would be gained by a few groups of P. insignis, excelsa, Sabiniana, Lambertiana, and Deodars, and how much the bare and savage grandeur of the forest scene would be relieved by such planting? It cannot now be said that the Pines I have enumerated are rare; in most nurseries of repute they may be obtained by the hundred. I speak of grouping Pines. I am of opinion that to obtain the true effect of each kind, and even to procure their most favourable development, many, if not all of our Pines should be grouped, leaving each tree ample space to attain its full and perfect development; and, for this, positions must be sought in our broad parks. Early collectors and admirers of Coniferæ were compelled to confine themselves to a single plant of each kind, which was duly transferred as soon as obtained to the Pinetum. This system of arrangement was dictated by necessity rather than taste, and the value of such a collection was in every way useful and interesting. Who that has seen the Dropmore collection has not been grateful to the noble lady who at so much trouble and expense formed it, and to the clever gardener whose attention and skill have so much promoted the development of the object of it; but several of these Pines are already shouldering each other for room, and seem to want more breathing space, as will be the case in all Pinetums, unless acres be appropriated instead of roods. It would be ingratitude not to acknowledge the advantages we have derived from these early Pinetums; we are enabled to select the really valuable from the general collection, and suffer no hazard; but our gratitude surely need not lead us to repeat a system which belongs more particularly to a botanic garden—that of planting Conifers apart from all other trees, perhaps in formal rows, at stated distances. No, our gardens are not large enough for our coniferous riches—there is breathing space in our parks and wastes. Plant, I say, abundantly—such, for instance, as Douglas Firs, Picea grandis, the Deodar, Pinus Lambertiana, macrocarpa, Sabiniana, insignis, excelsa, and a score more which need not now be enumerated; but plant them away from the shrubbery, out of the garden, wherever there is breadth and breathing space, where they may be allowed to remain, to give a new and beautiful feature to rugged scenes, to give warmth and perpetual verdure, and better still, according to the estimation of this utilitarian age, fine timber, and thus a good return for present expenditure; our children's children will be grateful for the boon. *W. I.*

Remedies Proposed for the Sting of the Bee.—I have tried all kinds, and the juice of the Onion has been successful with all on whom I have tried it—men, women, and children. The secret consists in taking out the sting and applying the juice at once, rubbing it well in. If you allow a long time to elapse before you apply the remedy, the poison has spread so far into the system that it becomes hopeless to attempt to destroy it by any measures; it is almost certain to take its course. This is an additional reason for using Onions, which are sure to be at hand. *A. L. M., Spinfield.*

Slough Carnation Show.—I have to thank "An old Amateur" for his "hint;" but I am sorry to say that it cannot be acted on on account of Rule 6, which states that "Names, fairly written, must be attached by exhibitors to the flowers; and the judges are restrained from awarding any prize if this regulation be not complied with." *John Edwards, July* 9.

Botanical Nomenclature.—I believe that the article of June 22d on the advantage of rendering natural knowledge into intelligible language, making it, as far as possible, part of the mother tongue, has given the greatest gratification to all who wish to see knowledge flourish and pedantry decay. It is indeed high time that gallipot and nursery Latin should be abolished, and that anything a man knows he should be enabled to communicate in one language at once. The universal language of science for the learned—the vernacular for those who speak their mother tongue—is, as is well put in the article alluded to, no doubt, the right view of the subject. I, among many, rejoice that a decided step has been taken in this direction, at last, by one possessing the means of carrying the matter forward with rapidity and success, and I heartily wish him God speed in this most important effort for bettering the mental condition of Englishmen. *L.*—— I am sorry that I cannot agree in the proposed new Anglicised names for plants. It is all very well for common plants which everybody knows, such as Wallflower, Pink, Daisy, Hollyhock, &c.; but it seems to me that inventing new names for the multitude of exoties which are now introduced is, to say the least,

labour in vain. As plants become common, so will their botanic names also become familiar, as Fuchsia, Azalea, Camellia, Rhododendron, Kalmia have already. A more useful reform would be, I should think, if care was taken by botanists to give names more short and easy to pronounce than many of those given of late years, and eschewing those derived from the Greek, as many of those of Ferns and Orchids now are, such as Anæctochilus in the latter, and Didymochlæna in the former. A friend of mine calls that Fern "Diddle me clean, oh. I can't master such a name." Another very desirable plan would be that of the late Dr. Herbert, requesting that all garden hybrids should be distinguished by the specific name being in the genitive case, and real wild species by the adjective. Thus the new Fuchsias should be called Eppsii, Chandleri, &c., not Eppsiana, Chandleriana, and so on with all other plants. This might be easily done. Why should not the two societies, Horticultural and Botanical, name a committee of nomenclature for new plants? allowing nurserymen to give their own seedlings their own names if they please, but taking care that such name is in the genitive case. Continental botanists would be most thankful for such a plan, to prevent the daily increasing confusion of species, &c. Plants ought to have their names registered, and if shown for a prize under any other name to be disqualified. I throw out this as a hint which I think will be useful. *A Member of the Horticultural and Royal Botanic Societies, Sennicote, near Chichester, July* 4.

——I agree almost word for word with the article signed "Nomenclator," with perhaps this difference, that I would Anglicise the terminations of generic names only in the cases of plants and animals, which are often, as with Orchids, mentioned in conversation. *C.*

——I believe it to be impossible, or at all events a matter attended with the greatest possible inconvenience, to change the present system. It may be a pedantic one, but the error has been committed (if error it be) of giving names unpronounceable except by the highly educated; and it appears to me that the evils of change would be far greater than continuing the Greek and Latin derivations. In the first place, from the peculiarity and difficulty of acquiring the names, they are impressed on the memories of those who have not a knowledge of the dead languages, and they are forcibly impressed also on those who are able to appreciate the aptitude of their application. In the second place the difficulties of giving English names (as translations) are insurmountable; some of these have been exposed by "Nomenclator;" but look at Anglicising "Clitoria ternatea," or even calling Stanhopeas Stanhopes, which name has for years been applied to a particular two-wheeled vehicle. I will say nothing of the hardship of making all who have learned the names under the old system recommence their education by forcing them to learn the new. I dislike pedantry, and if botany and floriculture were in their infancy, I should hope that good honest English names might be given, though this now I consider would tend to separate English botanical science from that of the rest of the world; the use of the dead languages for the names and descriptions of plants makes the discoveries of scientific men of all countries known to the world at large, whereas the use of any one modern language for this purpose would sadly curtail this knowledge. *T. D. H.*

Death of Mr. Murray.—I am sure that you will be sorry to learn that we have lost the excellent curator of our botanic garden, Mr. Andrew Murray. He died on Thursday last, the 4th of July, after a very short illness. Few persons have been so highly respected as he was, and no one can have better deserved respect. From having seen much of him, I had come to regard him as a friend, and was greatly grieved to learn, on my return home, that he was dead. You may recollect that he was chosen by examination from amongst a large number of candidates, in April 1845, and the value of that mode of selection could not have been more strongly shown than in his case, as I am convinced that it would have been impossible to obtain a man better fitted for the office. We can hardly expect as good a man to succeed him. All who have seen what he has done in converting a corn field into a botanical garden containing one of the best collections of hardy trees, shrubs, and herbs in the kingdom (see the catalogue which he has recently drawn up and printed), can and must appreciate his eminence in his professional capacity; but it is only those who have become intimately acquainted with him, as I have done, who know his full value. Thoroughly understanding his business, both in its scientific and practical departments, he was respectful but firm in his well formed opinion towards his superiors, and a good master to those under him. He has left a widow and young family to lament his loss. In a word, all who have had intercourse with him, either private or professional, must feel regret at his death. *Charles C. Babington, St. John's College, Cambridge, July* 8.

Purification of Water.—The poor people in the village of D—, consisting of 30 cottages, depend on a small shallow pool, to which cattle have access for water to drink. It is often, as at present, muddy, green, and odiously fetid. Some of the richer inhabitants are willing to go to the expense of from 20*l.* to 30*l.*, to build a large filter in the pool, if they could ascertain that it is possible, under the circumstances, to make a filter which would purify such foul water. As our pool is over the chalk, the bottom must not be broken. It has occurred to me that the best method would be to build a 9-inch wall, with small holes in it, 4 feet in height, or equalling the depth of water, in a circle about 14 feet in diameter, and in the middle of this to build another circular wall, with holes in it, about 3 feet in diameter, filling up the space between the two walls with oblique layers of sand and gravel or other filtering materials. A pump on the banks of the pool might communicate by a pipe with the central receptacle, 3 feet in diameter; and as soon as a bucket of water was pumped out, an equal amount would, I hope, soon percolate inwards through the oblique layers of sand and gravel. I do not suppose that the consumption is 800 gallons per day. If any one will give the result of their experience in any similar case, it will be doing a real act of charity to all the poor of our small village. The first and main point is whether such foul water, apparently holding organic matter in solution, can be purified; and secondly, under the circumstances described, what would be the best kind of filter. In the plan here suggested the filtering materials would always be waterlogged, and not occasionally aërated, as in common household filters; whether aëration is important I know not. Lastly, how long will a filter continue to act without any care being taken of it? Any annual subscription would be obtained here with difficulty. As the filter, moreover, would have to be built in the middle of the pool, it could be cleaned out at most only once a year, during the driest part of summer. *C. D.* [We insert this letter in the hope that some correspondent may kindly give "C. D." the benefit of his experience. There is an invention called the hydrostatic syphon water purifier, patented by Mr. Alfred Bird, experimental chemist, Birmingham, which, if it acts well, seems likely to suit such a purpose as this.]

Societies.

CALEDONIAN HORTICULTURAL, *June* 6.—The weather being unfavourable, the visitors were not so numerous on this occasion as usual. Ranunculuses: 1st, Mr. Young, Newington Lodge, for Queen Victoria, Prince Albert, Minerva, Dr. Goldsmith, Ramsay, Florida, Earl Grey, Kilgour's Mottled, Vanguard, Apollo, Kilgour's Straw Mottled, and John Knox; 2d, Mr. Mitchell, Kirkcaldy, for Lucifer, Defiance, Mrs. White, Garland, Jupiter, Queen Victoria, Jenny Lind, Rosa, Richard Cobden, Rebecca, Sunrise, and Prince Albert. Pansies: 1st, Mr. Gorrie, Inveresk, for Constellation, Magnificent, Model of Perfection, Cossack, Aurora, Blue Queen, Climax, Potentate, Lord Hardinge, Duke of Norfolk, France Cycolé, Sambo, Supreme, Miss Wedderburn, Lord Nelson, Almanzor, Pliny, Marchioness of Ailsa, Douglas, Brilliant Perfection, Optimus, Elegant, Hunt's Wellington, and Mrs. Bragg; 2d, Mr. King, Inveresk, for Rainbow, Supreme, Optimus, France Cycole, Marchioness of Ailsa, Potentate, Mrs. Bragg, Mrs. Hamilton, Zabdii, Constellation, Almanzor, Pliny, Magic Circle, Orestes, Lady Sale, Climax, Cremlin, Douglas, Alboni, Satirist, Elegant, Cypress, Ne plus ultra, and Aurora. Pelargoniums: 1st, Mr. Cossar, Peebles, for Beck's Cruenta, Arabella, Gustavus, Centurion, Lyne's Chaplet, and Queen Anne; 2d, Mr. Cameron, Trinity Cottage, for Negress, Gulielme, Forget-me-not, Tisiphone, Vixen, and Sir Walter Scott. Ghent Azaleas: 1st, Mr. Sleigh, Lauriston Castle, for pontica grandissima, Ne plus ultra, sulphurea picta, double blush, cruenta, paniculata picta, ignescens major, pontica compacta, alba flavescens, coccinea major, pontica carnea crispa, and calendulacea flammea. Ferns in pots: 1st, Mr. Veitch, Arniston, for Pteris hastata, P. arguta, and P. rotundifolia, Adiantum pubescens, Asplenium viviparum, and Lygodium scandens; 2d, Mr. Thomson, gr. to Dr. Neill, for Adiantum Capillus-Veneris, A. pedatum, Trichomanes brevisetum, Asplenium filix-fœmina monstrosa, A. fontanum, and A. alternifolium. Alpine Plants: 1st, Mr. Veitch, for Linnæa borealis, Astragalus leucophæus, Pyrola minor, Ramonda pyrenaica, Phlox aristata, Cerastium sylvaticum, Anthyllis montana, and Dianthus nitidus; 2d, Mr. Thomson, Canonmills Cottage, for Scilla verna, Myosotis alpestris, Ramonda pyrenaica, Erinus hispanicus, Alyssum olympicum, Erigeron alpinus, Saxifraga Andrewsii, and S. cotyledon. Asparagus: 1st, Mr. Renton, Ayton, for "Gravesend." Early Turnips: Mr. Stewart, Bangholm Cottage, for Dutch white. Early Potatoes: 1st, Mr. King, Inveresk, for Early Snowdrop Kidney; 2d, Mr. Cossar, King's-meadows, for Ash-leaved Kidneys. Peas: 1st, Mr. King, for fine pods of Prince Albert.

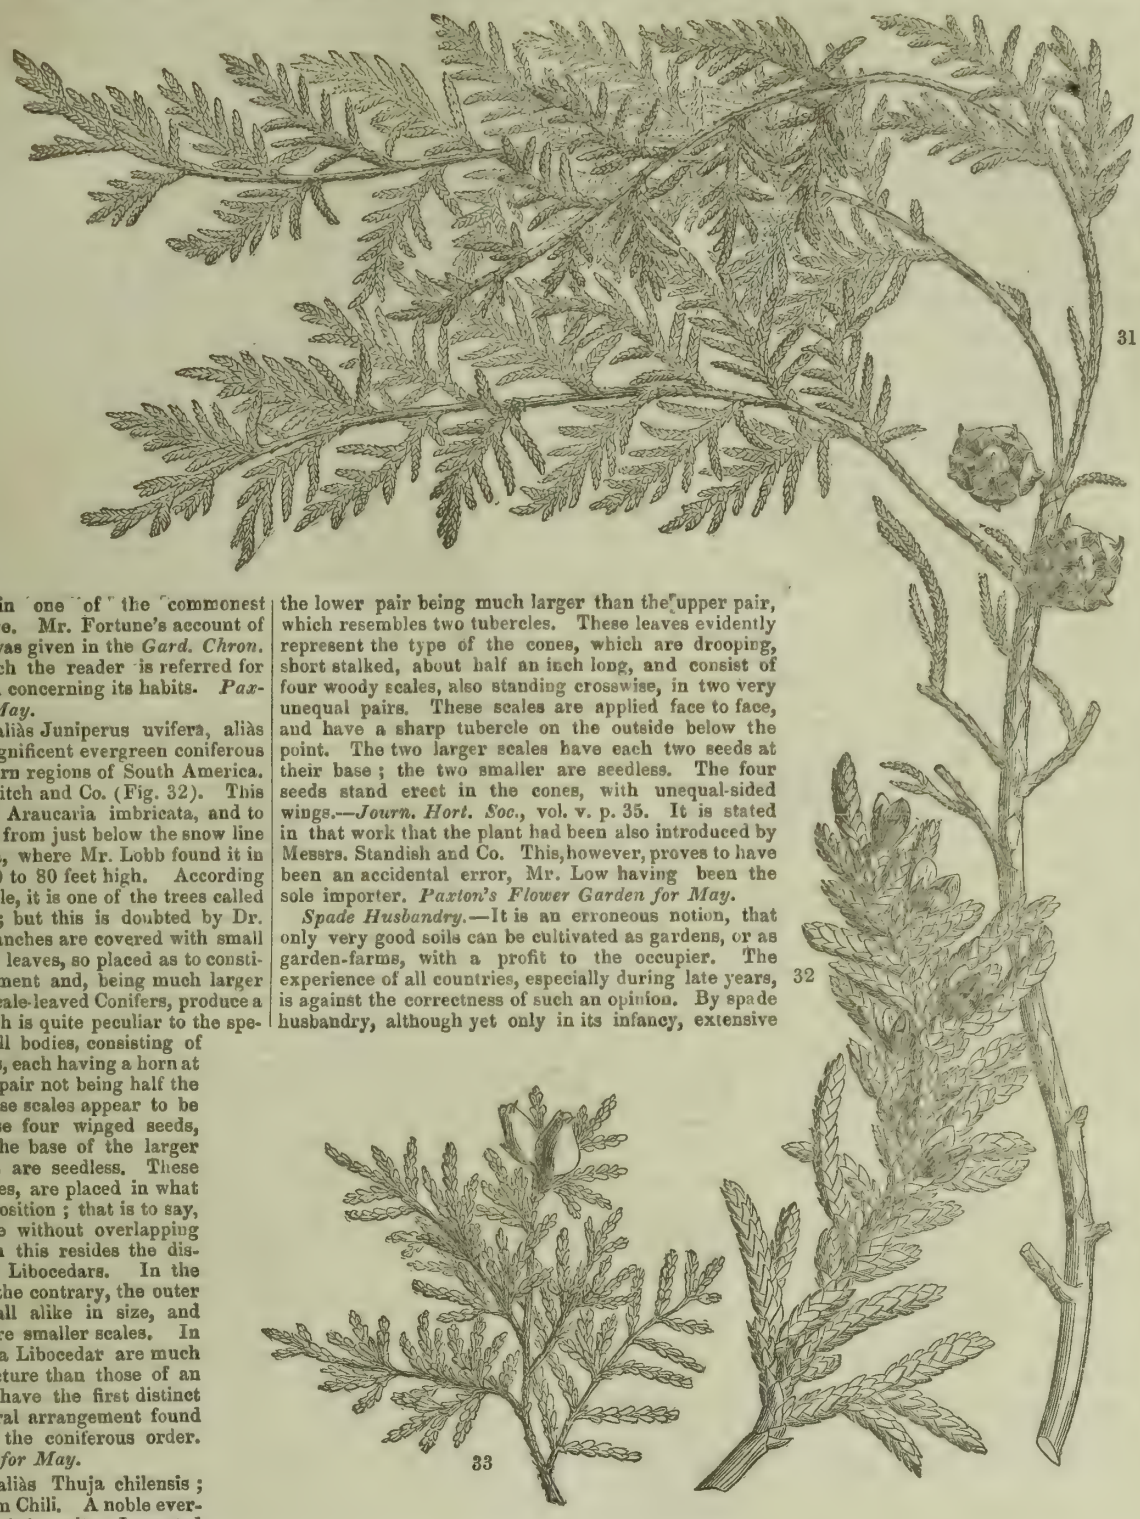
WORTON COTTAGE MELTING, *July* 10.—CARNATIONS: Puxley's Mars is a brilliant scarlet flake, with good white; shape and substance good, and quite equal to our best flowers of the same class. May's Antonio is one of the most noble rose flakes we have yet seen; it is well marked, and sufficiently full for all purposes. May's Romeo is a promising bright rose flake, which will be seen better as the season advances. PICOTEES: Matthews' Juno is a delicately marked purple flower of the same colour as Lady Chesterfield, and steady to its character as seen last season. Dodswell's Mary is a light red edge of very good quality; in truth, the flower is Youell's Gem, of double its size. Dodswell's Alfred is a superlatively fine and bold purple-edged flower, having white of the greatest purity; the edging is hardly so heavily laid on as in Wood's Princess Alice, whose colour it much resembles. Parkinson's Mary Ann is a promising red-edged variety. The above were all produced by Mr. Turner, of Slough. The same grower also supplied a bloom of his Pink, "Colcutt's Sappho," in very fine condition. PELARGONIUMS: Mr. Hoyle sent some pips of yearling seedlings, two or three of which exhibited considerable merits particularly Pretty Polly, a purple flower; and Vivianum, a remarkably bright crimson one. FUCHSIAS: A considerable number of seedling blooms, raised by Mr. Banks, of Deal, were placed on the table in fine condition. Several of them displayed much excellence, but we need not describe them more particularly, as we learnt they are to be exhibited on the plants. We cannot help remarking that the appointment of these meetings on a Wednesday has been very unfortunate; for as they are not held when any metropolitan exhibitions take place on the same day, raisers and exhibitors have been deterred from sending their productions, from the consequent uncertainty. Several letters have been received remarking upon this, but for this season we cannot now recommend any alteration.

ENTOMOLOGICAL, *July* 1.—W. SPENCE, Esq., F.R.S., in the chair. The chairman announced that Mr. Janson had been elected curator of the Society in the stead of Mr. F. Smith, and that the prize offered at a former meeting for the best essay on a genus of Tortricidæ, had been awarded to Mr. Logan, of Duddington, for a monograph on the genus Penthina. Specimens of the hitherto rare Zeuzera arundinis were exhibited by Messrs. J. F. Stephens, Bond, and Shepherd, and it was stated by Mr. Bond that the chrysalis of this singular moth is able to ascend and descend the interior of the stem of the reed with as much facility as the larva; when ready to emerge it pushes itself half out of the reed; a habit of which Mr. Westwood mentioned an analogous case recently observed in a species of Cecidomyia, a minute two-winged fly which resides in the same situation. Mr. White also noticed that a gigantic species of Cossus in the British Museum collection, from Australia, possesses similar habits. Mr. S. Stevens exhibited various rare Microlepidoptera recently captured, including Psecadia funerella, Sericoris littoralis, &c.; also part of a hamper made of Willow twigs attacked by vast numbers of Saperda (Gracilia) minuta, many living individuals of which were distributed among the members. Mr. F. Smith noticed the occurrence of great numbers of Leiosoma punctatum, at the roots of Sisymbrium officinale, and exhibited a drawing of some larvæ which he thought might probably be the young state of that weevil; also drawings of a species of Hydrobius, bearing a mass of eggs beneath its abdomen within a gum-like case. Mr. White mentioned that the genus Fluvicola of De Kay, hitherto placed among the Crustacea, was considered by Mr. Haliday to be the larva of some species of the family Hydrophilidæ. He also read a letter from Mrs. Hamilton relative to capture in India of a singular species of long-horned weevil, and also a notice of the zoological attainments of the late Dr. Leach. Mr. Westwood read the commencement of a paper consisting of Observations on the new Strepsipterous Insects brought from Albania by S. S. Saunders, Esq.; and Mr. Stainton read the description of Micropteryx aruncella, a small species of moth. Mr. Westwood brought for distribution a number of specimens of the case-bearing larvæ of Astyages hemerobiella? and also exhibited specimens of the larvæ of Lymexylon navale, which is, at the present time, committing much injury to the Oak planks in Pembroke dock-yard.

Review.

Loudon's Hortus Britannicus. A New Edition. By Mrs. Loudon. 8vo. Longmans.

IN one sense the last catalogue of cultivated plants will always be the best, because it is the most complete, provided due care is taken in preparing it. In this point of view this re-issue of Loudon's well known work will be welcome. It is carefully executed, beautifully printed, and brought up nearly to the present hour.



But there are serious faults in its plan, and especially in its classification. The present edition consists of two distinct parts. Firstly, of the old catalogue, arranged on the Linnean system, with a few additional references, and occupying 466 pages. Secondly, of a supplement of more than 200 pages, in which the plants not in the old catalogue are arranged alphabetically. By this unfortunate contrivance the two parts do not coincide; and they can only be compared with trouble and difficulty. The arrangement should have been wholly Linnean or wholly alphabetical; both bad for the purposes of gardeners, and when mixed indescribably inconvenient.

A person who consults such a catalogue wishes to find all the plants that belong to the same natural order collected in the same place. His inquiries necessarily lead him to want such assistance. But in a catalogue of this kind the object is wholly frustrated. If, for example, he wished for a list of Orchids, the old Linnean system would have put them all in Gynandria; but here they must be sought for in a hundred different places. So with Conifers; the Linnean arrangement would have brought them all into Monœcia, or Dicœcia; into two clusters; but here they have to be looked for in as many places as there happens to be genera. Faults of this kind are serious, and render Mrs. Loudon's catalogue very inferior to the last edition of Donn's "Hortus Cantabrigiensis." The greater completeness of the former will, however, we doubt not, give it greater value in the eyes of many.

We would only add a hope that the publishers will issue the supplement in a separate volume from the old stereotyped catalogue. It would be a great convenience to those who possess the latter, and who may not be inclined to buy it twice over.

Miscellaneous.

Cupressus funebris (aliàs Cupressus pendula).—A large weeping evergreen coniferous tree, from Chinese Tartary. Obtained by Mr. Fortune, and introduced by Messrs. Standish and Co., of Bagshot. (Fig. 31.) This is probably the most interesting coniferous plant yet in cultivation, and must in time displace the Weeping Willow. It is perfectly hardy, as was indicated by its native country. It is figured in Lord Macartney's Embassy to China, where it forms a weeping tree in the fore-ground of the view of the "Vale of Tombs," a place situated in the inclement climate of Zhehol. The rude representation of it on Chinese porcelain, having been copied by our manufacturers, have given rise to the "willow-pattern" found in one of the commonest kinds of English table-ware. Mr. Fortune's account of his discovery of the tree was given in the *Gard. Chron.* for April 13 last, to which the reader is referred for more detailed information concerning its habits. *Paxton's Flower Garden for May.*

31

Libocedrus tetragona (aliàs Juniperus uvifera, aliàs Thuja tetragona).—A magnificent evergreen coniferous tree, from the cold southern regions of South America. Introduced by Messrs. Veitch and Co. (Fig. 32). This promises to be a rival of Araucaria imbricata, and to be as hardy; for it comes from just below the snow line of the Andes of Patagonia, where Mr. Lobb found it in the state of a tree from 50 to 80 feet high. According to the officers of the Beagle, it is one of the trees called by the Spaniards, Alerçe; but this is doubted by Dr. Hooker. The young branches are covered with small thick dark green scales or leaves, so placed as to constitute a four-sided arrangement and, being much larger than is usual among the scale-leaved Conifers, produce a massive appearance, which is quite peculiar to the species. The cones are small bodies, consisting of two opposite pairs of scales, each having a horn at its back, and the exterior pair not being half the length of the inner. These scales appear to be whitish inside, and inclose four winged seeds, which stand in pairs at the base of the larger scales; the smaller scales are seedless. These scales, of two different sizes, are placed in what botanists call a valvate position; that is to say, they all touch at the edge without overlapping any interior scale; and in this resides the distinctive character of the Libocedars. In the Arbor-vitæs (Thuja), on the contrary, the outer scales of the cones are all alike in size, and always inclose two or more smaller scales. In other words, the cones of a Libocedar are much more simple in their structure than those of an Arbor-vitæ, in which we have the first distinct commencement of the spiral arrangement found in the higher branches of the coniferous order. *Paxton's Flower Garden for May.*

32

33

Libocedrus chilensis aliàs Thuja chilensis; aliàs Thuja andina. From Chili. A noble evergreen, with the habit of an Arbor vitæ. Imported by Messrs. Low and Co. Natural order Conifers. (Fig 33.) A fine evergreen tree. Mr. Bridges says that it is from 65 to 80 feet high; Sir W. Hooker, that it is a tree from 30 to 40 feet high, of great beauty, and well worthy of being introduced into our gardens. Pöppig relates that it resembles the Arbor-vitæ, but is less robust, sometimes branching from the base, and gaining the habit of a Cypress, but in other cases forming a conical head. "The trunk," he adds, "of this last variety is simple as high as the middle, straight, taper, clothed with a rough cracked bark of a brownish ash-colour, knotty, scarcely more than a foot thick, with a yellowish, resinous, hard, strong scented *(olente)* wood." Whether it will bear the climate of England without protection is at present uncertain. The young branches of this tree, when they are visible, are compressed, obovate between the nodes, and bright green, with glaucous furrows; they are, however, for the most part, hidden by the leaves. The latter, which are compressed, blunt, and keeled, are glaucous at the sides, but bright green at the back and edges; they stand in two pairs crosswise, the lower pair being much larger than the upper pair, which resembles two tubercles. These leaves evidently represent the type of the cones, which are drooping, short stalked, about half an inch long, and consist of four woody scales, also standing crosswise, in two very unequal pairs. These scales are applied face to face, and have a sharp tubercle on the outside below the point. The two larger scales have each two seeds at their base; the two smaller are seedless. The four seeds stand erect in the cones, with unequal-sided wings.—*Journ. Hort. Soc.*, vol. v. p. 35. It is stated in that work that the plant had been also introduced by Messrs. Standish and Co. This, however, proves to have been an accidental error, Mr. Low having been the sole importer. *Paxton's Flower Garden for May.*

Spade Husbandry.—It is an erroneous notion, that only very good soils can be cultivated as gardens, or as garden-farms, with a profit to the occupier. The experience of all countries, especially during late years, is against the correctness of such an opinion. By spade husbandry, although yet only in its infancy, extensive districts of blowing-sand have been brought into cultivation in Flanders; whilst in various parts of England it has been equally successful: witness the gardens of the cottagers of the black, hungry sands of Bagshot-heath, the poor chalks of Beachey Head, in Sussex, the deep trembling bogs of Lancashire. By many experienced agriculturists the spade is considered to be the greatest of all fertilisers, not only for gardens but for fields. It is at once less expensive and more productive. The mere moving of the soil produces incalculable benefit. By the spade, and the spade only, some of the poorest, thinnest-skinned lands of Surrey have, by the deep trenching of the cottagers, been made to produce all the common vegetables, such as Potatoes, Cabbages, Peas, Carrots, Beans, &c. The same returns have been effected in the poor hungry heaths which adjoin the South-Western Railway. "No gardener," observed the late Dr. Yellowly, "would think of planting Potatoes, Cabbages, or Carrots, in ploughed land, if he could get it dug; for the difference of produce far more than compensates for the difference of cost. By turning up or loosening the ground 5 or 6 inches deeper than the plough—which does not ordinarily act on more than 3 or 4 inches of soil, there is an opportunity afforded for the descent and diffusion of the roots of plants." Another authority (Mr. Blacker) emphatically remarks that, for many reasons, every small farmer should use the spade. In drill crops, he may thus "put in a quicker succession of his crops, and have one coming forward as the other is ripening. In wet seasons he can dig when he can't plough; and the value of the spade in turning up stiff clay land in autumn, and exposing the soil to frost and snow, is hardly to be imagined. In all such lands the plan should be pursued where no winter crop is put in." Experience has proved that a good digging or forking is more beneficial to the land than two or three ploughings; as the soil is thus more fully pulverised and the land more completely levelled. The fork usually employed is a strong one of three prongs, of 14 inches in depth, and 7½ inches in width. This is found to be more manageable than the spade, and less expensive. For boys and lads, a somewhat lighter fork, upon the same construction, should be procured. According to Dr. Yellowly, when men are employed, "the digging is effected by taking in about 4 inches of earth at a time, pressing perpendicularly, and getting to a proper depth at two thrusts. The earth is not, however, turned out of the trench to a greater depth than 10 inches, though the fork may get down as far as 13 or 14; but that which remains at the bottom in a state of what is called 'crumbs,' answers the purpose equally well with the earth which is thrown out, of forming a permeable medium for the roots of the plants which are to grow in it." *From the Finchley Manuals of Industry, No. II.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Any more of the Indian Azaleas which have completed their growth, and formed their flower-buds, may now have a slight shift if becoming root-bound, according to the advice given some time back. They may be kept cool, so as to avoid a second growth. This treatment will be equally appropriate for any hard-wooded plants in a similar state of maturity. Although water may for some time yet be liberally supplied to plants in general, it is necessary to make many exceptions to the rule, and these will every day become more numerous. Many plants which have matured their growth require a less abundant supply; and to those with bulbous or tuberous roots, which are now ripening their growth, the allowance of this element must be every day more restricted. Plants in flower of Thunbergias, Achimenes, Gloxinias, Geraniums, Fuchsias, &c., the beauty of which it is desirable to preserve as long as possible, should be assisted with occasional waterings of liquid manure; and that the foliage, as well as flowers, may retain their healthy appearance, let the pots, if possible, be plunged, or shaded by surrounding plants, to protect them from the scorching heat of the sun. Pelargoniums of the forcing kinds, which were cut down some time since and are now commencing their growth, should be shaken out of the old soil, and, after having their roots trimmed, should be repotted in sandy soil moderately rich, placed in a close frame, and sparingly watered, till they have made some progress in their new growth. None of the sorts form more beautiful objects, or are better adapted for forcing, than the fancy varieties; and for this purpose a quantity of healthy plants should be expressly prepared.

FORCING DEPARTMENT.

Pineries.—If the heating apparatus of any of these structures is in any way defective, or even doubtful, the natural heat of the season admits of the artificial heat being with the least risk dispensed with, and thus affords the needful opportunity for making the necessary alterations. It is annoying enough to have the state of

things disturbed at any time, but this is not equal to the vexation arising from an old boiler bursting, or a set of pipes or tanks giving way, in the middle of winter; especially when due forethought and careful observation would have prevented the catastrophe. Withhold water from plants which are ripening their fruit; and the soil in which plants in other stages are growing should be frequently examined, to see that the constant syringings do not make it too wet, and thereby endanger the health of the roots. Do not, on the other hand, allow them to suffer from lack of moisture, either about the roots or in the atmosphere; and let them be supplied with a bottom heat of 85°. VINERIES.—The most important thing to be attended to in these houses is to keep the red spider in check; where this has been properly attended to during the last three months, and where syringing was not continued too long, the bloom will be uninjured, and the appearance of the fruit will by this be considerably enhanced; besides which, the plants are in a much better condition to perform the functions necessary for ensuring a good crop next season. Let this be kept in view during the rest of the autumn, as it is still more essential that the foliage of late Vines should be kept in the highest health to the latest period possible. Attend, when necessary, to the watering of inside borders, and of those on the outside which are covered with tarpaulin or other material. A slight mulching of decayed leaves or dung is very useful during summer, in preventing excessive or sudden variation in the state or temperature of the soil, and the cracking of the ground, and consequent injury to the roots in hot, dry weather.

FLOWER GARDEN AND SHRUBBERIES.

Strict attention to neatness should prevail in this department, by rolling, sweeping, mowing, &c., and by tying or pegging down half-hardy plants as they advance in growth. Do not allow any of these to extend themselves outwardly so far as to injure the edgings, whether of Box or turf; and in cleaning the shrub masses, where herbaceous plants or annuals have been planted or sown in vacant places, take care that the latter are not injured by the encroachments of these quick growing plants. Where flowers are planted in the circles of bare soil round specimen fastigiate shrubs, great care should be taken to prevent the lower branches of the latter from sustaining injury. Any annuals or other half hardy plants, whose season of beauty is past, should be immediately removed, and their place supplied from the reserve garden, planting sufficiently near to produce at once a dazzling display. The Roses should be again gone over, and all gross shoots that are not likely to flower this season, the dead flowers, and those which have done flowering, should be cut out. Young strong growths of autumn flowering Roses in masses should be pegged down; and those of the summer flowering kinds, as the Moss, Provins, or Gallica varieties, should be layered; the whole surface of the beds should be forked over, and if a good soaking of liquid manure can be given, its effect will be very apparent in the greater permanency of the colours, and in the lengthened period of blooming. Remove dead flower stalks from bulbous rooted Irises, unless seed is wanted from them; do not however disturb the foliage until it is quite ripe. If any alteration in their arrangement is contemplated, it should be effected as early as possible after that time, as they commence making new roots immediately. White Lilies, which are now in beauty, should be taken up and replanted once in two years, and as in the case of the Iris, this should be done as soon as the old stems are decayed. The beds for either of these plants should be prepared of rich loamy soil, containing a good portion of sand or burned clay, and charred refuse, with a sufficient admixture of soot to destroy all animal life. And in planting, a little sand should be laid above and below the bulbs.

FLORISTS' FLOWERS.

DAHLIAS.— We are now giving ours weak liquid manure, and with a small three-pronged fork we occasionally stir the surface. If the plants are required to produce flowers for exhibition, it will be advisable to remove all buds now, if the variety is at all under-sized, as it will be taxing the energies of the plant to little purpose; but when the variety is large and coarse, they should be left to grow. POLYANTHUSES.—Should the weather prove wet these plants may be parted. Do not use a knife in the operation, the ivory handle of a budding knife will be found a suitable instrument. When planted out, in a shady suitable situation, do not let them lack moisture; and a temporary screen will prove highly beneficial till the plants are established. RANUNCULUSES.—It often happens that amateurs have seedlings, the roots of which are so thin and small as often to be overlooked in the soil. The way we manage to lose none, is to get a fine wire sieve, into which we empty a quantity of the soil containing the seedling roots; we then have a tub of water, in which we place the sieve, moving it about in the water; by this means every particle of soil passes through, leaving the roots behind. It is but little trouble, and many fine sorts are thus saved, for it often happens that the weakest are best.

HARDY FRUIT GARDEN.

One of the most important things to be done at this time is the preparing of ground for new plantations of Strawberries, and planting them as early as possible, that they may produce a crop of fruit the first season. This they will do, and the fruit will be of the finest quality if they are planted this month, and proper care is taken to keep them well watered during dry weather until they are fairly established. Strawberries do best in a rather strong, rich, and deep soil. Where the soil of the garden is naturally light, improve it by adding marl or strong loam with plenty of manure. Rows of Strawberries along the edges of walks look well, and are very convenient, as the fruit can be gathered without treading upon the ground, while the quarters are relieved and made available for crops which it is desirable to place a little further from the eye. The earliest plants produced by this year's runners should be selected, and in separating them from the parent plants, a few inches of the string should be retained to assist in fixing the plant in the ground. If they are planted on quarters, the rows should stand 2 feet apart each way. This will allow room for intermediate rows of Endive, Spinach, or dwarf York Cabbage this autumn, and the plants will require all the room next spring. By allowing plenty of room the fruit is finer, cleaner, and more abundant than when the plants are allowed to crowd one another and entirely shade the surface. The most desirable of the old kinds are Myatt's Eliza for a very early sort, Keens' Seedling and British Queen for general crops, and the Eleanor, which is very fine and comes in later. For preserving, none surpasses the old Grove-end Scarlet and the Roseberry. Of the newer varieties, we have proved the following: Comte de Paris, free bearing and fine in appearance, but rather acid; Princess Royal of France, the same; Hooper's Seedling, much better than Keens' Seedling both in regard to flavour and free bearing; Black Prince, a fine dark colour, early, and a free bearer; but none comes up to Myatt's Eliza for flavour, while it is also very early and a handsome fruit.

KITCHEN GARDEN.

A few days of hot dry weather, at any time during summer, renders it indispensable on the part of good gardeners to supply water artificially to many of their crops; as the check which the plants otherwise receive is very detrimental to their health, especially if they have been recently planted, or are natural inhabitants of marshy ground or the sea shore, such as Celery, Asparagus, or Seakale. When the operation of watering is necessary, take advantage of such opportunities to stimulate the plants with liquid manure, if it is by any means obtainable. Proceed with the planting out of the various autumn and winter crops, selecting the most favourable weather for the purpose, and taking care that the ground has plenty of manure; and if there be any doubt about the quantity already dug being insufficient, let an additional portion of manure and a good sprinkling of soot be forked in as the planting proceeds. Give every attention to all growing crops, so as to insure abundance and quality. Liquid manure will be found very useful now; and this, with stirring the ground deeply with a fork among the growing crops, is the sure way to succeed in realising the best results. Rampion, which is invaluable as a winter substitute for the Radish, should be transplanted from the seed bed into a south border. Care should be taken not to injure the tap root; and before planting, any strong side shoots should be removed, to throw strength into the main one.

State of the Weather near London, for the week ending July 11, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

BACK NUMBERS OF THE GARDENERS' CHRONICLE: The publisher begs to say that the following may be had. Any subscriber who will forward postage stamps equivalent to as many numbers as are required, will have them sent free by post. The volume for 1847, price 30*s.*, and volume for 1848, price 30*s.* 6*d.*, can still be had. The volume for 1849 is now ready, price 30*s.* The volumes of former years are out of print.

1841—1, 8, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34, 45, 46, 47, 48, 51.

1842—4, 6, 8, 11, 16, 18, 20, 31, 32, 42, 45, 50, 51, 52.

1843—13, 16, 17, 18, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 36, 37, 40, 41, 42, 48, 49, 50, 52.

1844—All except 36, 37, 46, 50.

1845—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 13, 14, 15, 17, 18, 19, 20, 21, 23, 24, 25, 27, 28, 31, 33, 39, 40, 41, 42, 43, 44, 45, 50, 51, 52.

1846—4, 5, 6, 7, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 38, 42, 43, 46, 48, 49.

1847—1, 2, 3, 4, 5, 8, 11, 13, 14, 16, 19, 20, 21, 22, 27, 28, 32, 33, 36, 37, 39, 41, 42, 43, 44, 45, 46, 47, 48, 51, 52.

1848—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 30, 33, 34, 36, 37, 39, 40, 41, 44, 45, 51, 52, 53.

1849—All except 46, 49.

BEES: *A B.* The best thing you can do with the hive containing the old stock, and the other containing the second swarm, is to allow the bees to collect what honey they can till the first bad weather about the middle of August; then destroy them, and take the honey. This is presuming, from your description, that the stock is nearly worn out, and the other is only a cast. It would have been better had the cast been returned to the parent hive in the evening of the day it was thrown off.

BOOKS: *A Constant Reader.* Ask in Paris for Cosson and Germain's "Flore des Environs de Paris." Buy common *papier gris* when you arrive.—*D G O.* The annual treatment of Geraniums and Fuchsias is given in the Calendar to Beck's "Florist," and some good articles on the culture of Lilies have appeared in the same work. ‡

DAMP HOUSE: *Buckhurst.* Tar will not do. Use a coat of Roman cement, or fill the trench with concrete. When walks are raised, the borders and turf will be wet after heavy rain. What then? You need not walk at that time on either turf or borders.

DRYING PLANTS: *E A P.* See an article on this subject in another column of to-day's Paper.‡

GRAPES: *Sub.* The Abee is a tender Grape, and will not succeed with you unless you give it plenty of heat and air. The appearance of the bunch sent would indicate that many of the flowers had not been fertilised; the temperature has probably been too low, and the atmosphere of the house too damp at setting time.‡

INSECTS: *J W G.* The elephant hawk-moth (Chœrocampa elpenor). *W.*—*T C.* 1, Clytus arcuatus; 2, Hoplia argentea (the two hind claws are soldered together, as you will see under a strong lens); 3, Chrysomela staphylea. Stephens' "Manual of British Beetles" will suit you. Be so good as to pin the specimens sent. Those received are smashed. *W.*—*T D H.* We could find no traces of insects in the sand, although we again used a microscope for a considerable time. If small the insects were doubtless killed, and destroyed by friction. Send some separate in spirits or in cotton wool. *W.*—*G P H.* The larva will turn to a lady-bird. The moths are the small ermine (Yponomeuta padella), and the caterpillars on the Turnips are those of the common small white butterfly, as well as we can judge from their very young state. The large caterpillar mentioned is probably the same full grown. *W.*

LAURUSTINUS: *Jeremiah.* When the leaf was young, *and folded up*, a small piece of the edges was injured by some chance.

MORPHOLOGY: *J Q S.* Very curious, but not rare. It has been already figured by us in a different state in our volume for 1849, p. 772.

MULE PINK: *F G H.* No opinion can be formed without seeing much better specimens, and knowing all about its parentage.

NAMES OF FRUITS: *G M.* No. 1 is not the Early Purple Guigne; it appears to be the Black Eagle. No. 2 is correctly named the Black Tartarian. No. 3 is not the true Old Pine or Carolina; the fruit of this excellent sort is conical with a neck, firm, juicy, heavier than that of any other variety known to us, and its foliage is of the darkest green.‖

NAMES OF PLANTS: *C H L.* It is not different from the common Sweet Pea. Many annuals will live through a winter, if they do not flower in the previous year.—*J W.* Stanhopea Devoniensis and guttulata.—*Montrose.* Viburnum Opulus.—*A H.* There is reason to suppose that the plant current under the nursery name of Deutzia sanguinea was stolen from Dr. von Siebold, and that it is a Callicarpa! We know nothing of D. celosioides and Godhokerii, concerning which we can only say *Gare.*—*J R M.* Borage (Borago officinalis), an old and well-known native "herb." Don't you remember the distich,

I Borage, } or, { Ego Borago,
Give courage, } or, { Cor ago.

Anderton. 1, Ophrys apifera; 2, Orchis maculata; 3, Jasione montana; 4 and 5, Lotus corniculatus.—*G R.* Holcus lanatus, Dactylis glomerata, Avena flavescens, Agrostis vulgaris. —*Rosacea.* Why not Geum urbanum, with flowers rather larger than usual, or perhaps G. heterophyllum?—*A Constant Sub, York.* The leaves of the Thorn are attacked by a fungus called Æcidium laceratum, those of the Maple by Æcidium cancellatum. Neither cause nor cure are known.—*H.* Abies Balsamea and A. Picea.— *Cymro.* Scolopendrium officinarum. *S.*

PAXTON'S COTTAGERS' CALENDAR may be had at the Office of this Paper, or of any bookseller, price 3*d.*, or 5*s.* for 25 copies for distribution amongst cottage tenantry.

PEAR TREE: *E F L.* Root prune it now. ‡

POTATOES: *A H.* We cannot say that we see anything surprising in what you have sent.

ROSES: *L L.* Chénédolé is some proper name whose origin and orthography are alike unknown to us. Mulberry trees form an excess of male flowers because the wood is not properly ripened. Root prune yours *now*, and remove all overshadowing trees.

SCREENS: *C H L.* No objection to Lombardy Poplars, if you do not dislike their appearance. No Pines will grow so fast. Pinus Laricio grows fastest. Limes and Sycamores will both make great progress, so will Ash and Elm, only they rob the ground to an inconvenient degree.

STRAWBERRIES: *Barnhill.* We are unacquainted with La Delicieuse. The statements made by interested parties should always be confirmed by those who are not interested.—*Iota.* There are several varieties of the Hautboy. No doubt you have the variety called "the Prolific." We are well acquainted with it.

TREES AND SHRUBS: *X.* There is a very nice list of them just issued by Whitley and Osborn, of Fulham; and we refer you to it.

VINES: *Tinydail.* We are glad to have so good an account of your Vaccovinery; there is a name for you, if you want one. Blussard, B.; Sahibee, W.; Muscadine, W.; Chasselas, W.; Gromier, B.; all for the Vinery; but the two first will be all the better for more heat.—*C A A Lloyd.* Let the roots which spring out of the branches alone; they will do no harm. ‡

MISC.: *G B.* Root-pruning in July or August will no doubt answer for Plums and Cherries, as well as for Apples and Pears. ‡—*A Lady Gardener.* Prune your China Roses in spring. The new Antirrhinums for bedding are hardy like the old ones, and may be left in the beds during the winter.

SEEDLING FLOWERS.

CALCEOLARIAS: *M H.* Numbers nearly all detached from the blooms; 14, fine large rich crimson flower, of good shape; 4, yellow with large spots on the top, forming a blotch of spots, is good and novel; 18, pretty, but too oval; 12, a charming variety, with a pale buff ground, covered with large crimson spots, but rather too flat; some of your other flowers are also promising.*—*W H H.* All finely formed, large, and well marked. The spotted variety with buff ground is the best and most novel. Some of the others are very similar in marking to flowers already in cultivation. The blooms having dropped from the calyx, to which the numbers were attached, we cannot refer to them individually.*—*A Z P.* All richly spotted and beautiful, but none of them free from faults. The best are numbers 25 and 26; 15 is pretty, but it is too small in size and too large in the mouth.*

EPIPHYLLUM: *M P A.* A beautiful variety, in the way of E. speciosum majus.*

PELARGONIUM: *J W.* Pretty; but inferior to many kinds now in cultivation.*

PINKS: *G B S.* Your Pink is a large and not bad flower, but it is nevertheless far from being first-rate. It requires smoothness and regularity in the lacing; the white is good; the centre petals are confused, and of bad shape; there is also too much white outside the lacing. It should be grown from an old root, being too heavy when produced on a young vigorous plant.*

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

PROGRAMME.

THURSDAY, July 11.—Last day of receiving Implements, Seeds, &c., to be exhibited in the Implement-yard, and arranged by the Stewards for the Judges' inspection.

TUESDAY, 16.—Stock received in the Show-yard from Eight in the morning till Four in the afternoon. At Six o'clock in the afternoon (provided the Judges have completed their trials by that hour) Members of Council and Governors of the Society will have the privilege of admission into the Implement-yard at the same rate as the public next day, namely, at 2*s.* 6*d.*

WEDNESDAY, 17.—The Implement-yard open to the public from Eight in the morning till Six in the evening; admission 2*s.* 6*d.* The Judges to inspect the Live Stock and award the Prizes. At One o'clock (or as soon after as all the Judges shall have delivered in their awards) the public to be admitted into the Cattle-yard, on the payment of 10*s.* each person, at the Special Entrance; Members of Council and Governors being admitted by tickets, to be purchased at the Finance Department of the Society, in the Guildhall. N.B.—Notice will be posted up over such entrance when the Judges have completed their awards. At Six o'clock, Professor Simonds's Lecture in the Athenæum, "On the Structure, Functions, and Diseases of the Liver in Domesticated Animals;" at the conclusion of which the awards of the Judges of Live Stock (with the exception of the awards for Horses) will be read.

THURSDAY, 18.—The Cattle and Implement-yards open to the public from Six o'clock in the morning till Two in the afternoon; admission 2*s.* 6*d.*; and from Two till Six in the evening, at 1*s.* The Dinner of the Society in the Great Pavilion (at the extremity of Queen-street) at Four o'clock. Doors open at half-past Three.

FRIDAY, 19.—The Cattle and Implement-yards open to the public from Six o'clock in the morning till Twelve at noon; admission 1*s.* each person. General Meeting of the Members in the Guildhall at Ten o'clock in the forenoon. At Eleven A.M., Mr. Turner will attend his Catch-meadows at Barton, near Exeter, and explain to the Members their construction; and at Three P.M., Sir Thomas Dyke Acland, Bart., M.P., will receive the Members at his Water-meadows, at Killerton, and make arrangements for their due explanation.

The Cattle and Implement Show-yards are situate at Mount Radford, on the eastern side of the city, between the Heavitree and Topsham turnpike-roads, about three quarters of a mile from the Cathedral.

PRESIDENT.

THE MARQUIS OF DOWNSHIRE.

STEWARDS OF DEPARTMENTS.

Cattle—Mr. HUDSON, of Castleacre, Mr. STOKES, Mr. JONAS.
Implements—Col. CHALLONER, Hon. DUDLEY PELHAM, M.P., Sir MATTHEW WHITE RIDLEY, Bart.
Finance—Col. AUSTEN.
Sale of Tickets—Mr. HENRY WILSON, of Stowlangtoft.
Receipts and Admission to Show-yards—Mr. RAYMOND BARKER.
Pavilion Dinner—Hon. ROBERT HENRY CLIVE, M.P., Sir JOHN V. B. JOHNSTONE, Bart., M.P., and Mr. SHAW, of London.
General Arrangement of Show—Mr. BRANDRETH GIBBS.

By Order of the Council, JAMES HUDSON, Secretary.
London, July 13.

By the Regulations of the Society, all persons admitted into the Show-yards, or other places in the temporary occupation of the Society during the Meeting, shall be subject to the Rules, Orders, and Regulations of the Council.

SALE OF TICKETS AT THE GUILDHALL, EXETER.

I. CATTLE-YARD TICKETS.—To Members of Council and Governors only; for admission into the Cattle-yard on the afternoon and evening of Wednesday, 2*s.* 6*d.* each; sold on Wednesday from 10 A.M. till 6 P.M.

II. LECTURE TICKETS.—To Members or their Friends; for admission to Professor Simonds's Lecture in the Athenæum, distributed gratis on Wednesday from 10 A.M. till 6 P.M.

III. PAVILION DINNER TICKETS, price 10*s.* each (including a pint of wine).—(1.) To Members only; on Wednesday from 10 A.M. till 6 P.M. (2.) To Members or their Friends; on Thursday from 8 A.M. till 3 P.M.

The Tickets for admitting the public into the Show-yards will be sold at the entrance of the Show-yards during the respective periods of the exhibition of Implements and Stock.

Subscriptions due to the Society will be received by the Finance Committee, at the Guildhall.

TO HORTICULTURAL AND FLORICULTURAL SOCIETIES.

BENJAMIN EDGINGTON, Manufacturer to the Horticultural Society, Chiswick, and the Royal Botanic Society, Regent's Park, solicits attention to his stock of Marquees and Tents of every variety, and suitable for all climates. Orders per post duly attended to. Address, BENJAMIN EDGINGTON, 2, Duke-street, Southwark. A Warehouse, 208, Piccadilly.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

NEW AGRICULTURAL IMPLEMENT.

BROWN'S PATENT FUMIGATOR, manufactured on a scale applicable for agricultural purposes, such as injecting a strong volume of smoke upon growing Turnips and other drilled crops, and thus obstructing the ravages of the fly. Also for fumigating Hops, Wall or Standard Fruit Trees, and driving vermin from their haunts.

Price Ten Shillings to Ten Pounds, according to Size.

Manufactured and supplied to the Trade by Messrs. COTTAM and HALLAM, 76, Oxford-street, London, where the Engine may be seen in operation.

SCIENTIFIC ACADEMY AND AGRICULTURAL TRAINING SCHOOL, Kennington, near London, July 1, 1850.

MESSRS. NESBIT take the liberty of directing the attention of Parents to the advantages offered by their Establishment, in the education of youth intended for the Arts, Manufactures, or Agriculture. Though the power, influence, and wealth of England, depend, in a great measure, upon the proper application of scientific knowledge to the working of her minerals and soils; yet, in the education of her youth, Science has hitherto been almost wholly neglected. It is, however, evident that a young man, who, in addition to the common education, possesses a sound knowledge of Analytical Chemistry, Mineralogy, and other kindred subjects, will be the best prepared to engage with success in any technical branch of business for which he may be designed.

In their system of instruction, Messrs. NESBIT give a prominent position to the physical sciences; and experience has proved that instead of retarding the pursuit of the ordinary studies, they materially assist in their acquirement.

The pupils have repeatedly been examined by some of the first Professors in the Metropolis, who have expressed themselves highly gratified with their general knowledge, and with their attainments in physical science.

Terms and other particulars may be known on application.
38, Kennington-lane, London.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	...	...	£10 0 0
Clover Manure, do.	...	...	11 0 0
Turnip Manure, do.	...	...	7 0 0
Superphosphate of Lime	...	...	7 0 0
Sulphuric Acid and Coprolites	...	...	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

The Agricultural Gazette.

SATURDAY, JULY 13, 1850.

MEETINGS FOR THE FOLLOWING WEEK.

TUESDAY, July	16	Meeting of the Agricultural Society of England at Exeter.
WEDNESDAY, —	17	
THURSDAY, —	18	
FRIDAY, —	18	—Agricultural Imp. Society of Ireland.

THE subject of ROAD REFORM is essentially a public one. It has already excited a considerable amount of interest and attention throughout the kingdom, but as yet, unfortunately, little or no practical good has issued from it. The public mind is slow in its progress towards conviction, and still slower in putting into practical operation the suggestions of those who have taken the trouble to think and write *pro bono publico*. Mr. PAGAN, a Scotch lawyer, has not only thought, and thought deeply, on the evils of our present turnpike system, but he has written ably on the subject, and to him the travelling public of Great Britain and Ireland owe the exposition of a simple and business-like plan, by which a large saving may be effected in the management of our roads everywhere throughout the country, while, at the same time, the existing debt will be rapidly liquidated, and the efficiency of the highways will remain unimpaired. The merits of this proposal have already been discussed somewhat fully in our columns, by ourselves and by correspondents, and the desirableness of some such change as Mr. PAGAN recommends, proved by a reference to various parts of England, where the expenses of collecting the road revenue and general management amount to a most startling per centage on the entire income derived from the turnpike traffic. In the cases adduced by Mr. PAGAN to illustrate this disproportion—the counties of Fife and Kinross—*the expenses incurred in collecting the funds and managing the roads amounts to* 44 *per cent. of the whole expenditure of the roads themselves.*

By the proposed reform the expense of management would only amount to 8½ per cent. on the expenditure, so that a direct saving of 35½ per cent. would thus be effected to the public. The total abolition of turnpikes and the substitution of a uniform tax on horses, are the simple means by which it is proposed to carry this saving into effect; and the suggestion is so well-timed and reasonable that the wonder is, not that it should have attracted so large a measure of public attention when first broached, but that the excitement should have subsided without producing some alteration in a system, the evils of which have been so ably exposed, not only by a clever, clear-headed lawyer, thoroughly conversant with all their ramifications, but also by a large portion of the public press, and by every public-spirited individual not interested in the maintenance of the present obnoxious and highly discreditable state of matters.

A minute enumeration of the evils of the present turnpike system is not required to prove the urgent need there exists for a radical change in the mode of collecting the funds levied upon those who travel along our roads, and habitually, or occasionally, make use of them; for however much a change may be deprecated by the timid and the interested, few, we think, will refuse to acknowledge that these evils exist in a variety of Protean shapes excessively annoying to the peaceably disposed traveller. We may therefore diverge a little from the pounds, shillings, and pence path, in which the argument for road reform might easily be brought to a most convincing and triumphant termination, in order to cull a few of those wayside flowers which constitute the traveller's *bouquet* as he journeys along the turnpike roads of many parts of the United Kingdom.

We have first and foremost to notice the existence of a line of barricades, in the shape of toll-bars, pleasantly situated at pretty close intervals across our great public thoroughfares at which the traveller must stand and deliver. Occasionally he may be indulged with a passport, consisting of a morsel of blurred and blotted paper—half ink and half print—which if he is fortunate enough to preserve will carry him through another barricade some hundred yards farther on; but these passports, unlike those of our Continental neighbours, will scarcely carry the wayfarer with safety to his purse and peace of mind from one parish to another, far less from county to county.

Many instances might be adduced by way of illustrating the pleasures of travelling in the free and enlightened countries of England and Scotland; but doubtless most of our readers have had sufficient personal experience of the annoyance which the turnpike system inflicts to render necessary the enumeration of the many perils and vexations that have beset the traveller on a turnpike road, and which will continue to molest him so long as the barricade system continues. REBECCA and her daughters were the offspring of the foolish principle upon which the present oppressive and strife-engendering system of turnpike management is conducted; and had an annual uniform horse rate existed, it is highly improbable that the South Wales riots, with all their bloodshed and heavy expense to the country, would ever have occurred.

Were the turnpike system one in which a rigid economy formed a leading feature, and where the cost of management was at a minimum, and at the same time were equal facility and accommodation everywhere given to the locomotion of horses, live stock, and vehicles of every description, without being subjected to the imposition of different charges under one road trust from those exacted in another, the travelling public might probably submit to be tyrannised over by a class of individuals whom Mr. WELLER, sen., not without reason, concludes to be "misanthropes who revenge themselves on mankind by taking tolls." Instead, however, of economy being a characteristic of our present road system, when we find an expenditure, for merely collecting and managing the funds, of 44 per cent. upon the whole income, as much as the working expenses of many of our railways, we may surely be pardoned for betraying some little irritation and iteration on the subject of road reform.

A TABLE of RATES of DUTY chargeable on COFFEE, TEA, COCOA, FOREIGN and BRITISH SPIRITS, BEER, MALT and WINE respectively, in the United Kingdom in each of the last 15 Years, ending 5th January, 1850.

Years ended 5th Jan.	COFFEE.	TEA.	COCOA.	RUM.	Other Foreign and Colonial Spirits.	BRITISH SPIRITS.	BEER.	MALT.	WINE.	Years ended 5th Jan.

Inland Revenue Office, Broad-street, February 1850.

THE LABOURING CLASSES.

As one of your readers requests information respecting garden allotments, I send the following rules and remarks, which I hope may be generally useful, as they are the result of much observation and experience. The allotments for which these rules were more particularly drawn up, have answered well, though the land was by no means so suitable as desired, being wet, strong, and in very bad condition, and too far from the dwelling places of the labourers. It was, however, well under drained, without any charge to the allotment tenants. It has been let free of assessments, chiefly in portions of a quarter of an acre, and at the rate of 40*s.* per acre on an average, but varying in price according to quality and situation. From being unkind and unproductive land, it has become moderately kind working and very productive soil, producing two, three, or four times as much as it used to produce while in the farmers' hands. Like much land of the same kind in that country, it used to produce only two light crops in three years, being summer fallowed every third year. Now, the best cultivators get one or two good crops every year, and all might do so if they would sow all their crops in rows and hoe them repeatedly. Here the tradesmen have frequently proved to be the best cultivators, probably in consequence of the distance from the habitations being less toilsome to them than to the agricultural labourers, who too often have to walk far to and from their work; besides which, the latter are more disposed to pursue the old practices of the farmers, while the tradesmen try new and better ways. The farmers have very commonly been unfavourable to the allotment system; thinking that the labour bestowed on the garden was so much abstracted from his day's work. But where the quantity has not been more than a fourth, a sixth, or an eighth of an acre, the land dry and light and near to the cottage of the labourer, whose wife and children assisted in its cultivation, and the rent reasonable, the result has almost invariably been satisfactory. Allotments have greatly improved the moral character of the labourers, and alleviated the parishes. *H.*

Rules of the Society for Aiding the Labouring Classes in Thirsk and its Neighbourhood.

I. That a society be now established under the designation of a "Society for aiding the Labouring Classes in Thirsk and its neighbourhood."

II. That the principles on which such society shall be formed shall be the following:

1. That of encouraging and promoting the exercise of foresight, prudence, and industry in the working classes, towards the maintenance of themselves and their families in comfort and respectability.

2. That of avoiding any interruption of the relations and responsibilities which mutually belong to, or exist between the owners and occupiers of property and the working classes.

3. That of discouraging and avoiding all application of the proceedings, so as to make them bear upon any questions which may occupy the attention of Parliament, with a view to legislative enactments.

III. That in accordance with these principles the objects of the society be:

1. To obtain allotments of land in such townships in the neighbourhood as it may be practicable, to be let to the working classes of industrious habits, and to be cultivated solely by the spade.

2. To endeavour to increase the amount of employment in the district, by circulating practical information with reference to spade husbandry and other manual methods of cultivating the soil.

3. And to encourage amongst the poor, by other means, habits of self-support, or dependance on their own exertions.

That local committees be formed in any townships where it may be practicable, or where no allotments of land are already granted to the poor, consisting of the clergyman and two or more members. That the business of such local committees shall be:

1. To endeavour to obtain, from the resident or other landed proprietors, a grant of land for the purpose of allotments; but that unless requested to take the management of such allotments by the landed proprietor, they do in no case take such management upon them without the consent of the general committee.

2. That such local committees shall be the medium of circulating information with reference to spade husbandry, or other similar means of increasing employment in the district.

That the committee of management may, where any landed proprietors decline to grant any land for allotments, or object to do so on account of the trouble occasioned thereby, take any land in such townships as may seem to them desirable, and re-let the same to the labouring classes, under the superintendence of the local committees.

That a meeting be held annually to audit the

accounts, to elect the officers and committee for the following year, and to amend or form rules for the government of the society.

In inviting public attention to the principles and objects of the society, as detailed in the previous resolutions, the committee consider that to those who are acquainted with the beneficial tendency of garden allotments, it may be useful to add the following extracts from a report of a committee of the House of Commons on allotments of land to the labouring poor, presented to the House on the 6th of July, 1843; and which clearly points out several important points to be kept in view in forming such allotments, and forcibly exhibits the value and importance of this means of assisting the industrious labourer. "Your committee have received much evidence about the arrangements and regulations under which the allotment system has been conducted, and have come to the conclusion that the following are those under which it may be most advantageously carried on."

1. "As it is desirable that the profits of the allotment should be viewed by the holder of it in the light of an aid, and not of a substitute for his ordinary income accruing from wages, and that they should not become an inducement to neglect his usual paid labour, the allotment should be of no greater extent than can be cultivated during the leisure moments of the labourer and his family. The exact size which would meet this condition must of course vary according to the nature of the soil, the strength and numbers of the family, and their leisure time; but one quarter of an acre is the size usually adopted, and best suited to the average of cases."

2. "The allotment should also be near the dwelling of its occupier; much of its benefit depends upon the facility afforded to the man, his wife, and his children, of devoting spare moments to the care of their ground, and being able to visit it frequently without fatigue."

3. "Though the land will yield larger profits under this mode of cultivation than under the usual method of tillage, the proprietor who wishes to benefit the poor man, should not exact more rent than he could expect to receive if he let it out to be farmed in the ordinary way."

4. "Tithes, parochial rates, taxes, and other charges, should be included in the rent, and paid by the owner, and not by the occupier, for the purpose of saving trouble in the collection, of preventing the accumulation of arrears, and of guarding the tenant against frequent and sudden demands for payments which he might not be prepared to meet."

"The rules adopted in places where the allotment system has been most successful, have insisted upon spade culture, have forbidden all underletting and working on Sunday, and have required that all causes of forfeiture—viz., non-payment of rent, gross misconduct, or wilful neglect of the land, should be embodied in the agreement signed by the tenant. (*See Rules.*) The rotation of crops has sometimes been enjoined in the rules; but that is a matter which may well be left to the discretion and experience of the cultivator. Under these arrangements, the system of garden allotments has proved an unmixed good. It has increased the produce, and enlarged the general stock of labour to be expended on the soil. It has enabled the labouring man to turn his leisure moments to profitable account, in raising wholesome food for his family, a rood of land frequently producing vegetables enough for six months' consumption. It has also supplied sound industrial training for the children under their parents' eye."

"Many striking instances have been stated to your committee, where the possession of an allotment has been the means of reclaiming the criminal, reforming the dissolute, and of changing the whole moral character and conduct. It appears that the holding of land directly from the landlord raises the position of the working man in his own estimation, and gives him a feeling of independence and self-respect. It gives him a stake in the country, and places him in the class which has something to lose—it gives him something which he may call his own; and as its value depends upon his own exertions, it prompts him to the exercise of self-control, and leads him to look on from the present towards the future. It furnishes him with an interest in life, to stimulate his faculties, to occupy his mind, and to inspire him with hope; and it becomes a powerful inducement to abstain from many of those offences which would lead to the forfeiture of this valued possession. Mr. Martin stated 'that of 3000 heads of families holding allotments in Kent, not one was committed for any offence during the years 1841 and 1842; that in the parish of Hadlow there were 35 commitments in 1835. The allotment system was introduced in 1836, and in the following year, 1837, the committments were reduced to one.' Since that we have had, among the tenants of the Society, about 15 of those who were in prison in 1835, and there has been no cause of complaint against them since we have had them. Since the year 1837, there has been but one commitment from among the holders of allotments."

"It does not appear to your committee that these important benefits are purchased at the expense of any other interest. All the witnesses were unanimous as to the punctuality with which the rents of those allotments which are under proper management are paid, and no more trouble seems to have been involved in collecting these than any other rents; frequently indeed, there is less. Numerous instances have been mentioned where the produce of the allotment has been effectual in keeping men from applying for parochial relief; and it may be safely assumed, that a practice which diminishes the poverty of the labouring class, and promotes their good conduct, cannot but be beneficial to the community at large. It has likewise had a peculiarly good effect upon the relations between the landowner and his cottage tenants; increasing his acquaintance and interest in their circumstances, and exciting in them more thankfulness and respect."

REGULATIONS FOR FIELD GARDEN ALLOTMENTS.

The Committee of the Thirsk Society submit the following rules, as those which may be advantageously adopted.

1. The rent (which shall include repairs of fences, parochial and other charges), to be paid by half-yearly instalments, on the Monday preceding Lady-day and Michaelmas, at 7 o'clock in the evening at

2. No occupier to under-let his allotment.

3. The allotment to be cultivated solely by the spade, to be sufficiently manured, and to be kept strictly clear from weeds.

4. No occupier to trespass upon another's allotment, and any damage done by the children to the crops of others to be made good by the parent.

5. If any occupier be a drunkard, or in the practice of frequenting public houses, or be quarrelsome, or use profane language, and shall persist in such habits (after having been reproved), he shall not be allowed to continue to rent his allotment after the end of the year.

6. If any occupier shall neglect his land, or be proved guilty of dishonesty, or of any other notorious immorality or offence against the laws, or continue after admonition to work in his allotment on a Sunday, or be guilty of a wilful breach of any of these rules, the landlord (or Committee) shall have full power, and without any legal process or other formal proceedings, to re-enter immediately and take possession of the land, with the crops growing thereon. The balance, if any in favour of the tenant, being paid to him.

7. The tenants to keep the path or road adjoining their allotments in good order.

8. Any occupier shall be at liberty to relinquish his allotment, on giving six weeks' notice, and his crops shall be valued to, and paid for by the new tenant.

9. Any disputes that may arise with any of the occupiers, respecting their allotments, to be decided by the landlord (or committee), and his (or their) decision to be final and binding.

Home Correspondence.

Eggs.—The following is a curious fact: A Cochin China hen, purchased from Mr. Nolan, of Dublin, laid several times from the perch after retiring to roost. I saw her do this twice, and early the next day found what I thought was her egg in a nest. To make sure of her eggs, I have locked her alone into a house with no perch, and last Saturday I found in the morning two eggs, one perfect, the other not quite, but almost shell-less—what is called here a flax-egg (I suppose flaccid), but of full size. These two eggs must have been laid within 12 hours of each other. Another hen, purchased from Mr. Nolan, laid 11 eggs in as many days, and weighed before sitting, which she is now doing, 6¾ lbs. I would desire to correct a mistake of Mr. Dixon's, namely that each hen always invariably lays the same shaped eggs. I have not found this to be the case; so much the contrary in some instances as to be quite puzzled in seeking to distinguish the eggs of hens which I thought I knew well. One in particular I put out to a poor woman to keep, with a cock and one other hen, which latter laid white eggs, the former buff. In three successive days the buff eggs were of three different shapes, one day nearly round, the next very obtuse at both ends, the third a handsome oval, nearly the same each end. It was a lone cottage, with no other fowls, so that there could be no mistake. *A. T. C. C.*

Chaff and Turnip Cutter.—On visiting a farm the other day, I saw a great many store cattle feeding upon straw and Vetches, chaffed together, which they devoured with great avidity. It has since struck me, that if we could get a machine which should constitute in itself a chaff and Turnip cutter, whose operations should take effect at one and the same time—the chaff and Turnip slice passing through rollers, to bruise the Turnips, and so moisten and blend them together (something like the operation of a furze-cutter and bruiser), we should be imitating our summer feeding upon which cattle thrive so much, and also use our straw with more economy. *J. Hood, Closglass.*

Cooper's Rye-grass.—In answer to "Enquirer" for Cooper's Rye-grass, there is no such plant. The enquirer probably means Cooper's Rye, a very early, hardy, productive, and excellent variety of Rye, which is cultivated and sold by Mr. Thomas Cooper, Ardleigh, Wick, Colchester, Essex, as well as by many other good Essex farmers and elsewhere. There is no such plant as Rye-grass at all, of any denomination. There is a Grass called Lolium, of which there are several species and many varieties, currently sown in most parts of Great Britain, either by itself or with various Clovers, for hay; as well the plant as its name were introduced into Devonshire and Cornwall, with many other names, tools, and practices, from the nearest parts of France to these coasts. In France it is called Iordie, and in Cornwall and Devon it is called Hever, Ever, or Iver, and also dropping the initial I and v is called Ray, and Ray-grass, through the greater part of England. It is a misnomer to call it Rye-grass. It has no resemblance nor affinity to Rye. It is believed that Mr. Cooper does not profess to sell any variety of Lolium of peculiar earliness or excellence. *W. P. T.*

Drill Husbandry.—In your Paper of June 15th, there are some remarks by Mr. Rawstorne on the drill system of husbandry, and on the small extent to which it is used in the Lothians. There is a very general opinion in this district (East Lothian), that unless where annual weeds are very bad, the crops are greater when sown broadcast than when drilled, and this even when the after culture, on which so much stress is laid by Mr. Rawstorne, is fully carried out. There is no machine in use for effecting this after culture, and hand-hoeing is the only resource. An experienced farmer, who drills a great deal, but hoes only where annual weeds abound, told me lately that he had repeatedly hoed small pieces in fields which were not hoed all over, and that he never knew the crop any the better for it. Mr. Rawstorne says that there was only one drill machine shown at Edinburgh in 1847, viz., Messrs. Garrett's. If Mr. Rawstorne was present at the show he must have forgotten to look at the drills, for there were at least half a dozen, and one amongst them which the judges preferred to Messrs. Garrett's, as they showed by adjudging it the prize. It was made by Messrs. W. and J. Hunter, Samuelston, Haddington, and was preferred on account of its extreme simplicity, being exceedingly light, sowing six drills at a time, and drawn by one horse. The great drawback in the eyes of a Scotchman, to most of the English machines, and to Messrs. Garrett's amongst the rest, is their weight and complication. He thinks that the machines of his own country are in general equally efficient, while they are simpler, lighter, and can be wrought with fewer hands and fewer horses. There is, however, a want of a good and simple (and cheap) horse hoe, and Messrs Garrett's may possibly come into use for want of a better. *A Lothian Farmer, Doddridge by Ford.*

Application of Manure.—It admits of no dispute that the fertility of alluvial soils, better grounds, and of all lowlands, arises from the quantity of materials that have been carried from the higher localities and deposited on the flats, and more chiefly from the very minute reduction of the ingredients, and the intimate relationship in which they are placed to each other. This allows the development of chemical action, which takes place only between the ultimate elements of matter, and at insensible distances. The general fertility of all loamy soils arises from the combination of the elements rather than the quantity or quality in any particular form or existence. Judging from the above natural appearances, I often think that manures should be mixed with the soil in the most minute possible manner, and since a chemical combination of elements exceeds human power to perform, the mechanical mixture must be done as perfectly as possible, in order to supply its place. In this way a farm-yard should be mixed with the soil, by repeated workings of the land by Finlayson's harrow, after the winter ploughing of 7 or 8 inches in depth; and, in order to facilitate this process, the straw for litter should be cut into short length by the knives of the cutting machinery, which will allow the mixing of the straw with the soil along with the solid fæces of the animals. A mass of dung laid in the hollow of drills exerts no influence on the land; any chemical action is wholly between the materials of the dung, as new combinations between bodies are inversely as their masses, or directly as the surfaces they present. The land and the dung are in masses, and thence is only the attraction of adhesion. Intimate contact and minute adherence are essentially necessary for the affinity of composition. The land and dung being mixed in this way, the drills will be very conveniently formed by one furrow of the common plough, moved as deeply as the power of two horses will admit. The soil will be full of moisture, having been wholly wrought by the grubber, and never turned up as by the plough to the exposure of drought. On the quantity of moisture in the land the safety of the Turnip crop altogether depends. *J. D.*

Thick or thin sown Wheat: July 4.—It is only just to the Rev. Mr. Wilkins to say, that about 5 acres of my Wheat are laid this morning by the heavy rains. I think they would not have been if sown with 4 pecks instead of 6. As the other 75 acres are still a standing crop, it becomes a question whether 6 pecks does not advantage me much more than injure me. I should say decidedly so. Still much depends upon a great variety of circumstances, particularly whether a wet or dry summer, also whether a favourable or unfavourable seed time. I presume much of the 5 acres laid will rise again when the rain ceases and a drying time ensues. Most of my Wheats are 5 feet high, some more. One thing is quite certain, the richer our land the greater the necessity for thin sowing. Woe be to those who in addition to thick sowing have a rank undercrop of unhoed weeds. What chance has such land of drying? *J. J. Mechi.*

Tenant right.—Referring to your article in a late *Gazette*, conveying some remarks on the Tenant Compensation Bill lately introduced by Mr. Pusey, I must observe that that gentleman is entitled to the thanks of the tenant farmers for his efforts to obtain for them a legalised "compensation for unexhausted improvements." Admitting the difficulty of legislating on the subject, it is something that public attention has been directed to this important subject. At the same time any enactment will be valueless unless accompanied with a rider or clause that will stultify and make illegal all special covenants and conditions as between landlord and tenant in the taking and letting of land. And perhaps this would be the best way of settling this much vexed question, by enacting the abolition of all covenants and restrictions, and establishing the settlement of dilapidation and improvement, as it now is settled by competent valuers and arbitration. Custom would soon establish a "tenant right" that would do justice to both landlord and tenant, giving the latter such compensation only as the merits of his claim demanded; while the landlord would have the benefit of all proved dilapidations and waste. Believing this plan, if properly carried out, would be the means of encouraging the cultivation of the land, I venture to present you with it. *J. Jephson Rowley, Rowthorne, July* 2.

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

(*Resumed from page* 429.)

DISCUSSION.—"A Water-meadow is the triumph of agricultural art, changing as it does the very seasons; but though our rustic forefathers so long since mastered the result, the mode of the water's action has been left a mystery."—MR. PUSEY, *Journal* x., 462.

Sir JOHN JOHNSTONE inquired of Professor Sewell what results on the subject of water for cattle had become known to him at the Royal Veterinary College. Prof. Sewell believed that cattle generally preferred soft to hard water, and would drink from ponds and ditches rather than from springs. He thought the temperature had something to do with it, for he knew a brewer who had 100 horses, and who for 30 years had allowed them, whenever at home from work, to drink as much as they pleased of the New River water kept at a blood-heat; in consequence of which, the animals were maintained in perfect health and strength, having no spasmodic affections of the bowels, no chills, no staring coats. Colonel Challoner had remarked that horses and cows preferred a pond into which dung-water had run. The Earl of Chichester had observed the same preference given for such water by cattle, but not to the same extent by sheep. Dr. Calvert had noticed that oxen preferred water in troughs to that in the clearest springs. The Duke of Richmond remarked, that water given to race-horses in the stable, had always the chill taken off it. Sir John Johnstone, in reverting to the subject of hardness, referred to the softening of water by boiling, as in the well-known case of water for tea, and inquired whether the whole of the 15 or 16 degrees of hardness occasioned by the carbonate of lime was removed by that action. Prof. Way

stated that the deposition of the carbonate of lime did not take place at once, on the application of heat. Prof. Clark considered 1½ or 2½ hours' boiling to be required to effect that object. The Rev. T. Cator referred to the use of soda in softening water, which Prof. Way observed was adopted on account of its being cheaper than soap. Mr. Raymond Barker alluded to the effect of toasted bread in softening water. He had a few days ago an opportunity of witnessing a confirmation of what had been stated, of the predilection of cattle for impure water, by seeing them turn away from fresh water drawn for them out of a well, and seek the mud-water collected in little pools in the meadow where they were pastured. He believed that cattle were generally indisposed to drink hard pure water.—Mr. Pusey, M.P., then favoured the meeting with his views on the action of water in connection with the beneficial effects attending the irrigation of land. He doubted whether, in the present state of our knowledge, it could be admitted as a general axiom that hard water was good for irrigation, and soft water, on the contrary, prejudicial. In Devonshire, the criterion by which practical workers in water meadows were guided in their judgment of the quality of the water most suitable for their operations, was that of a certain warm, soft, and oily sensation it communicated to the touch, when a portion of it was held and examined in the palm of the hand; the absence of such a quality indicating, in their opinion, a water unsuitable for irrigation. He knew, as a fact, that when lime existed in any water in such excess as to give to it petrifying properties, such water was considered by practical men as decidedly unfit for irrigating purposes. He accordingly much doubted whether hard water was the only water fit for irrigation. He trusted that water-meadows would not be confined to the limestone districts; for in those geological districts of the west of England, where irrigation had been so long and successfully practised, lime was absent, and had therefore to be brought on the land from other districts, as required for the purposes of cultivation; the water being in consequence naturally soft. He considered that water in general become softened by remaining some time in ponds. In the hilly districts of Devonshire, the water of the small streams running down the declivities was found to improve in its irrigating qualities. Again: it had been found that water running over peaty soil was prejudicial to it; but that the same water filtering through such land into the drains was advantageous to it, probably from carrying off the peaty matter; and by such percolation it became soft, and adapted for irrigation. He simply wished to express an opinion formed on the facts which had from time to time come before him on this subject, that it would, in the present state of their knowledge, be unsafe to assume the exclusive use of hard water in irrigation as an essential condition. In his paper on the Devonshire water-meadows, in the Society's Journal, he had only mentioned the prevailing opinion in that part of the country on this subject; he thought they were still ignorant on many important points in connection with the theory and practice of irrigation, and he trusted that the practical inspection of the catch and water-meadows of Sir Thomas Acland and Mr. George Turner, at the Exeter Meeting, and the chemical analyses of the waters to be made by Prof. Way, would tend to a more exact acquaintance with the principles and conditions of irrigation.—The Rev. Thos. Cator considered that the soil itself had much to do with the results of irrigation.—Mr. Almack fully agreed with the opinions expressed both by Mr. Pusey and Prof. Way. He thought that time would prove each of them to be correct in his views, when the particular conditions of each case were duly limited by further experience. He considered snow as the best exemplification of the beneficial action of water containing ammonia, and possessing chemical qualities from other impregnation, in addition to the influence exerted by its peculiar mechanical structure.—Mr. Fisher Hobbs was glad to find from Prof. Way that this subject, of the economical employment of water, was to be pursued by him still further, especially in reference to points connected with agricultural operations. He did not think that animals generally preferred muddy to clear marly water from clean wells, although they might prefer it, after it had been drawn and stood some time, to the same water in its cold fresh state as obtained immediately from the well. The cattle on one of his farms had so great a predilection for the drainage water from sand and gravel, that he was obliged to fence off the mouth of the drain whence the water issued in order to restrain them. He thought farmers ought not to allow the runnings from their farm-yards to get into their ponds. He could fully confirm the views of Mr. Pusey. A curious circumstance had come within his observation in reference to drainage water. He had cut a drain in his land 1 furlong in length and from 8 to 12 feet in depth through sand and gravel, and veins of clay, and which yielded 3 gallons of drainage-water per minute. When the hot weather set in, a most obnoxious odour proceeded from this drain, and there was found, on examination, an accumulation of several cart-loads of a congealed gelatinous-looking substance, of an ochreous colour, and in substance resembling fresh animal liver. On revisiting the place a fortnight ago, the whole mass of corruption had vanished, and only a few insects were to be found in its place.—Mr. Rowlandson made some observations on the soap-test process of Professor Clark. He thought it a very simple and useful test for the hardness of water in all cases excepting when (as in the water of the Dolomitic districts) the bi-carbonate of magnesia was present; whenever the hardness arose from magnesia he believed the soap-test would fail to indicate its degree, or rather, it would give a false indication of its amount; which might mislead, unless other tests were conjoined with the soap-test, for the purpose of guarding against this occurrence. —Professor Way was aware that Professor Clark's test applied only to certain waters; it was useful from its generally applicable and simple mode of employment; at the same time, he agreed with Mr. Rowlandson that, in cases where magnesia was suspected, it would be desirable to employ a collateral test, although the indication of hardness given by the soap-test with magnesian waters would at once, by its unusual amount, show the disturbance occasioned by the presence of some other salt than those of carbonate and sulphate of lime. With regard to the questions affecting the action of water in irrigation, he had only to repeat his diffidence on the subject, although he thought the criterion of hardness by which the Devonshire makers of water-meadows were guided might be fallacious, and that hard water might produce a soft oily feeling to the hand as well as soft water. He had himself formed the opinion that the effects resulting from irrigation were due more to the chemical qualities of the water than to the circumstance of its higher or lower temperature; but he was sensible how ignorant we were on these difficult questions, and he should be most open to conviction, and glad to learn all that he could on the interesting subjects to which he had then had the pleasure of calling the attention of the members.

On the motion of the Earl of Chichester, seconded by the Earl of Lonsdale, the best thanks of the meeting were then voted to Professor Way for his kindness in delivering before the members so interesting a lecture on that occasion.

A Weekly Council was held on Wednesday, the 26th of June; present, the Hon. Robert Henry Clive, M.P., Trustee, in the Chair; Earl of Lonsdale, Earl of Chichester, Lord Loraine, Sir Thos. Dyke Acland, Bart., M.P., Sir John V. B. Johnstone, Bart., M.P., Sir Montague Cholmeley, Bart., Sir Robert Price, Bart., M.P., Sir E. M. Elton, Bart., Mr. T. Raymond Barker, Mr. John R. Barker, Dr. Calvert, Col. Challoner, Mr. Fuller, M.P., Mr. Brandreth Gibbs, Mr. Fisher Hobbs, Mr. D. Lewis, Mr. Miles, M.P., Col. Morris, Mr. C. E. Overman, Mr. Parkins, Mr. Pendarves, M.P., Mr. Thos. Rowlandson, Prof. Sewell, Mr. Shaw (London), Mr. Shelley, Prof. Simonds, Mr. Towneley, Prof. Way, and Mr. Wilson, of Stowlangtoft.

The following new Members were elected:
Gard, Richard Sommers, Rougemont, Exeter
Lidstone, Roger, George-street, Plymouth
Johnson, James, Chatterley Hall Farm, Tunstall, Staffs.
Miles, William, Dix's Field, Exeter
Birmingham, William, Thillerton, Broadclist, Devonshire
Snow, Thomas, Franklyn, Exeter

The names of 13 candidates for election at the next meeting were then read.

Anglo-Merino Wool.—Mr. Rowlandson read to the Council a correspondence he had recently carried on with Mr. Leyland Woods, on the subject of Anglo-Merino Wool for the purposes of dyeing; and submitted to the members a sample of that wool. He stated that it retained all the fineness of the old Southdown with a longer staple, which was susceptible of improvement from carding and fine combing, and was sought after for the manufacture of cachmere and other shawls. Its quality was good, but its colour dirty, an unfavourable circumstance, which prevented the wool from taking that brilliant dye assumed by foreign wools. The great object of his bringing this subject before the Council was, to inquire whether the bad colour of this wool might not be obviated or removed by judicious management of some kind. Unfortunately, the close quality of the Southdown wool did not admit of that perfect washing to which the more open-fleeced wools could be subjected. The sample he exhibited possessed firmness and staple, and would fetch a high price in the market; and it would compete with the finest foreign wools, if by any means it could be properly cleansed for the dyer. An interesting conversation then ensued between the Earl of Chichester, Mr. Shelley, the Hon. Mr. Clive, and Mr. Overman, on the circumstances connected with the growth of this wool, the character and age of the sheep from which it had been obtained, the management of the wool, and its market price compared with other wools.—Mr. Fisher Hobbs agreed with Mr. Rowlandson on the importance of preparing this wool by such detergent means as would increase its quality for the dyer, and its market value as an article for the manufacturer.—Mr. Rowlandson remarked that the fineness of staple of this wool was adapted only for the finer class of goods, which were less in demand; it had every quality for that purpose, excepting purity of colour; and he feared the stain or discolouration, on account of which it thus failed in being perfect, was indelible, and arose from natural causes, not from accidental circumstances.—Mr. Raymond Barker thought that the colour of wool was much influenced by the soil on which the sheep were kept.—Mr. Overman suspected that the application of spirits of tar was the frequent cause of the stains which were the subject of complaint.—Mr. Fisher Hobbs had never found any difficulty in cleansing his wool by washing it twice with soft soap, and once with water. He thought it very desirable that some arrangement should be made by the woolstaplers and flockmasters, by which more inducement might be offered for the production of superior wools.

Turnip-Fly.—Lieut. Brown, R.N., exhibited to the Council his first attempt at adapting his Horticultural Fumigator to agricultural purposes. That little instrument had long been known to horticulturists as a simple, effectual, and portable means, by which volumes of tobacco or other fumes could be thrown in a cool and dense mass on shrubs and flowers, without injury to the most delicate plant; or, by which green-houses, stoves, frames, apiaries, houses, ships, or other enclosed spaces, might be fumigated in the most direct and precise manner. The successful employment of that instrument for those purposes had led Lieut. Brown (who had for many years in earlier life been extensively engaged in practical farming) to attempt its adaptation to field uses, especially to destroy or paralyze the ravages of the Turnip-fly, by fumigating the crop with the empyreumatic smoke, resulting from the slow burning of vegetable field refuse. This instrument was made for him by Messrs. Cottam and Hallen, and exhibited in action in the court-yard of the Society's house to the members. It consisted of a barrow-wheel and shaft-handles, supporting an iron-plate circular chamber, within which revolved (by means of a strap set in motion by such wheel) an axis with radiate fan-plates, at right angles to the plane of revolution of such axis. The chamber had two openings; one at the side, by which the smoke was drawn into it (through an upright cylinder, at the top of which was the combustion box) by the rapid revolution of the fans; and the other in front, by which the smoke was driven out through a pipe or nozzle, moving on a hollow ball-and-socket joint, and directed, like the same part of a garden-engine, on any object at pleasure. Mr. Brown was satisfied with the result of this first attempt, as far as it established, in his opinion, the application of his principle; but he was dissatisfied with it, inasmuch as the mechanical adjustments for generating the fumes, and throwing them out in sufficient quantity, and with the requisite rapidity, were incomplete. He hoped, by the 10th of July, to produce a perfect engine for the inspection of the Council. In the meantime, he remarked, that smoke of any kind was known to have the effect of paralyzing the fly, and arresting its ravages on the Turnip crop, until the young plants could get into rough leaf, and out of danger. The only practical difficulty consisted in the mechanical means of applying it; this, he hoped, would be accomplished when the engine he had the honour to exhibit to the members should be perfected. This barrow-fumigator was wheeled by one man within the drills, at the rate of three miles per hour; it could be set for any width or depth, and employed for any crop.

Cork Meeting.—Mr. Bullen, Secretary to the Royal Agricultural Improvement Society of Ireland, informed the Council, that the country meeting of that Society would this year be held in the city of Cork, in the week succeeding the Exeter Meeting of the Royal Agricultural Society of England; and he invited the attendance of the members and exhibitors who attended the latter meeting, to pass over into Ireland to the Cork Meeting, where a most cordial and grateful reception would be given to them, for such an instance of their sympathy and kind interest in the agriculture of the sister island, placed like that of England under the auspices of a kindred Royal Society.

A Monthly Council was held at the Society's House in Hanover-square, on Wednesday, the 3d of July; present, the Marquis of Downshire, President, in the chair; Lord Camoys, Lord Bridport, Lord Portman, Hon. R. H. Clive, M.P., Sir Matthew White Ridley, Bart., Sir Charles Lemon Bart., M.P., Sir Robert Price, Bart., Colonel Austen, Mr. Raymond Barker, Mr. C. Barnett, Mr. S. Bennett, Mr. Blanshard, Mr. Bramston, M.P., Mr. Brandreth, Mr. Burke, Mr. W. G. Cavendish, M.P., Colonel Challoner, Mr. Garrett, Mr. Brandreth Gibbs, Mr. Fisher Hobbs, Mr. S. Jonas, Mr. Kinder, Mr. Pendarves, M.P., Mr. Pusey, M.P., Prof. Sewell, Mr. Shaw, of London, Mr. Shelley, Prof. Simonds, Mr. W. Simpson, Mr. Stansfield, M.P., Mr. Turner, of Barton, Mr. Jonas Webb, and Prof. Way.

The following new members were elected:—
Morris, Colonel Lewis G. (Vice-President of the New York State Agricultural Society, and Chairman of the Board of Agriculture of the American Institute), Morrisania, near New York
Ffooks, Thomas, Sherborne, Dorset
Hardy, John, jun., 3, Portland-place, London
Snell, Benjamin, Wayton, Devonport
Hurd, Thomas, 2, Blandford-square, London
Roundell, Rev. Henry, Southernhay, Exeter
Bullock, George, East Coker, Somerset
Nunn, James Hardy, Pool-place, Great Yeldham, Essex
Wythis, George, Reigate, Surrey
Amos, Charles Edward, C.E., The Grove, Southwark
Dillett, John, Petticombe, Torrington
Durant, Richard, Sharpham, Devon
Cutler, George Henry, Upton-lodge, Torbay, Devon.

The names of 16 candidates for election at the next meeting were then read.

Finances.—Colonel Challoner, Chairman of the Finance Committee, presented to the Council the Monthly Report on the Accounts and Funds of the Society; from which it appeared, that on the last day of the month of June, then just ended, the current cash-balance in the hands of the bankers was 2435*l*. He explained that this general balance included 660*l*. on the Exeter Subscription Account, and 290*l*. to be invested as life-compositions; leaving a balance of 1485*l*. available for current purposes.—Colonel Challoner then proceeded to inform the Council that the cases of arrears in the county of Middlesex had been gone into, and where proceedings had been taken, the amounts claimed had either been paid into court, or at the office of the Society. In the case of one party, however, who re-

sisted the claim in a court of law, the Society obtained the amount of their demand with full costs. He added, that as soon as the period of the approaching Exeter Meeting was over, the Finance Committee would be prepared to proceed in the same manner with defaulters in other counties. This report was unanimously adopted by the Council.

Lecture-Room.—The report of the House Committee having been read, the consideration of that part of it which had reference to a recommendation by the Committee, that a lecture-room should be erected on the Society's premises, was deferred until the Committee were prepared to submit to the Council a working plan of the room proposed, and an estimate of its cost of erection. The Marquis of Downshire then informed the Council that, as their President at that time, it gave him very great pleasure to testify his respect to the members, and to evince his abiding interest in the welfare of the Society, by making a proposition to the Council which he hoped they would as readily accept, if it should be deemed advantageous to the prosecution of the worthy objects of the Society, as it was most readily and cheerfully offered on his part; namely, to avail themselves, as they should find it convenient, of the principal apartment in his family mansion in Hanover-square, where, by giving a day's notice to his servants, every accommodation would at once be made for any Lecture the Council might at any time decide upon, as calculated to diffuse scientific and practical information on agricultural subjects.—On the motion of Lord Camoys, seconded by Mr. Shelley, this most considerate and handsome offer on the part of the Marquis of Downshire was unanimously accepted by the Council, with an expression of their grateful sense of the kindness which had prompted his lordship to make it to them.

Agricultural Chemistry.—Mr. Pusey, M.P., in submitting to the Council the Report of the Chemical Committee, took that opportunity of expressing his satisfaction at the favourable progress made by Professor Way, in carrying out in his laboratory the various researches connected with important points of agricultural science and practice, recommended by the Committee, and approved by the Council.

Veterinary Inspection. — Mr. Raymond Barker, Chairman of the Veterinary Committee, laid before the Council the Report of that Committee, along with the special reports made to them by Professor Simonds, the Veterinary Inspector of the Society, on the case of cows in Somersetshire, belonging to a tenant of Lord Portman's, and on the outbreak of pleuro-pneumonia among the stock of Mr. Capel Cure, in Essex. These reports were referred to the Journal Committee. Professor Simonds continued to regard pleuro-pneumonia as a purely non-inflammatory disease at its commencement.

Exeter Meeting.—Lord Portman transmitted to the Council the following report from the General Exeter Committee:—

1. The Committee have concluded contracts with Mr. Manning for the execution of the pavilion and show-yards, and for the hire of hurdles.
2. They have concluded a contract with M. Soyer for the supply and furnishing of the pavilion dinner, at the average rate of the contract price at the former country meetings of the Society.
3. They have chosen by lot the stewards of the tables in the pavilion.
4. They have referred the invitations to the high table to a committee, consisting of the president, the past president, and the president-elect.
5. They have made a preliminary arrangement for the toasts and speakers at the pavilion dinner.
6. They have received and published the Secretary's final report, on his communication with the railway companies, on the subject of concessions in favour of the Society's Exibitors at the Exeter Meeting.
7. They have made the usual application to her Majesty's principal Secretary of State for the Home Department for metropolitan police.
8. They have made due arrangements for the various tickets and the official badges required at the Exeter Meeting.
9. They have completed and published the programme of proceedings for the occasion.

This report having been adopted by the Council, a report was received from Mr. Manning, the Society's contractor of works, on the near completion of all the arrangements connected with the erection of the Pavilion and Show-yards.—Mr. Brandreth Gibbs informed the Council that he should proceed to Exeter in a few days from that date, for the purpose of commencing his operations in the Show-yard, and that he should be prepared, as the Honorary Director of the Show, to receive and attend to any instructions the Council might think proper to transmit to him.

Judges.—Lord Portman, Chairman of the Judges' Committee, having transmitted to the Council the list of Judges recommended by them for the Exeter Meeting, in the different departments of Implements and Live Stock, the Council adopted that report, and made the appointment accordingly of the various branches proposed.

Sheep-Shearing.—On the motion of Mr. Shaw of London, seconded by Mr. Jonas, the Council passed the following resolution:—

"That it be an instruction to the judges to see, that according to the terms of the certificate, the sheep exhibited at the country meetings of the Society be fairly and properly shorn; and that the director of the show be requested to take measures that no shearing shall be allowed in the show-yard."

Leicester Sheep.—Mr. Pawlett, of Beeston, addressed a letter to the Council, entering into a detail of the "unfair practices that had been used at some of the shows of the Society, and which he understood would be again attempted at the ensuing Exeter Meeting; a communication he made in the hope that the Council would order special instructions to be given to the judges of Leicester sheep, to examine the different animals shown in those classes, before awarding the prizes, in order to disqualify all those that were not produced agreeably with the printed conditions."

Agricultural Implements. — Colonel Challoner, Chairman of the Implement Committee, presented to the Council the report of that committee, from the various practical details of which, connected with the stewards' department, the following two paragraphs may be selected for publication, on account of the general interest felt on the points to which they refer, namely:

1. The committee have the satisfaction of reporting to the Council, that the improvements made by Mr. Amos, the Consulting Engineer to the Society, in the apparatus for testing the power of machinery, will supersede the necessity of the Society's hiring or purchasing a steam-engine of their own for the trials at their Country Meeting.
2. The committee recommend that the judges, in their awards to implements under the head of "Miscellaneous," bear in mind the requirements of small farmers.

Colonel Challoner assured the Council that Mr. Amos's arrangements were now most perfect. It had been feared that the necessity of the Society's being put to the great expense and inconvenience of having their own steam-engine for their trials of agricultural implements and machinery would prove an imperative one; he, however, had not felt that fear so strongly as others had done; he knew the principle adopted for ascertaining what quantity of power each machine required to do a certain amount of work, to be a sound one; and he had full confidence that the zeal and mechanical science of Mr. Amos would ultimately triumph, as it had done, over every temporary obstacle.—Mr. Turner, of Barton, expressed the satisfaction he felt to find that attention was recommended to the wants of the small farmer, who required for the cultivation of his land only those implements that were simple in their construction and easy to be worked.—Colonel Challoner remarked, that being so well acquainted as he was with the county of Somerset, he well knew how much such implements as those recommended by the committee, and referred to by Mr. Turner, were required by the small holders in the West of England; and he should never rest content with the results obtained by the Society until implements on the best principle, and for every purpose of cultivation under those circumstances, could be made at a moderate expense by any common blacksmith throughout the country.

The President laid before the Council a communication addressed to him by M. Célestin Chilliard, of Paris, on his mode of arresting the progress of the Potato disease. Lord Rossmore conveyed the Council his high sense of the value of the Society's Journal. Mr. Nesbit, of Kennington, presented a copy of his chart of the principal Fossiliferous Deposits in the British Islands, prepared for the use of his pupils. Mr. Layton Cooke presented a copy of his "Referee and Guide to the Valuation of Real Property," dedicated by him to the Society. Mr. Henry Besley presented a copy of his "Hand Book to Exeter, and to the Exeter Meeting." The Council having ordered their usual thanks to the respective authors of these communications and presents, adjourned to the following Wednesday; and notice was given that, on the rising of that meeting, they should adjourn (over the Special Councils to be held at the Guildhall, in Exeter) to their monthly meeting in London, on Wednesday, the 7th of August.

Reviews.

A Word in Season; or, How the Corn-grower may yet grow Rich and his Labourer Happy. Addressed to the Stout British Farmer. Ridgway, Piccadilly. Pp. 16.

We ought before this to have introduced this pamphlet to our readers. It was introduced to us in the following terms by its author:

"Many a desponding farmer has published his balance-sheet, and in nine cases out of ten it is not merely a blank but a blot. Even the sanguine agriculturist, with all his outlay, and with the most sensible and scientific application of the soundest principles of chemistry to his subject, has but little to show at present beyond his fair tilled fields, his comely homestead, and a margin—for profits to come. Is this result of present prices for corn inevitable? I humbly conceive it is not, and I presume, through you, to call the attention of your readers to a plan by which, with Wheat at 40*s.*, the corn-grower's balance-sheet may yet show an abundant remuneration. The plan is given in the accompanying small pamphlet, which, if you feel so disposed, you are liberty to transcribe; containing, as it does, a reply to many questions which I see with great pleasure proposed in your columns. With regard to the accuracy of my statements, I have desired the publisher of the pamphlet, Mr. Ridgway, of Piccadilly, to give my address, if required, in order that they may be tested on the spot."

The plan detailed in this tract resembles that of Jethro Tull, who by wide intervals deeply tilled between his Wheat drills, succeeded in reaping annually a good crop for many successive years off the same land. The following long extract describes the practice on which our author bases the encouragement which he offers to the agricultural reader:

"——— Northamptonshire, November, 1849.

"My Wheat is coming up well; and it is a beautiful sight to see the thin green lines run so evenly and regularly that they seem to blend together in the distance. It is more striking from the broad intervals that separate the narrow lands, and mark out the growing crop into rows of three. Mark these intervals well; because it is upon these I build all my hopes that the corn-grower may yet grow rich and his labourer happy. Look closely, and you will perceive that the three rows of Wheat on each land are a foot apart. Each land, therefore, is two feet wide. Measure, and you will find the interval three feet. Then comes another land of three rows of Wheat; then another interval; and so on all over the acre. I only waited for the coming up of the Wheat in distinct lines, to dig these important intervals. They are just finished, and are the beginning of my labours for the next year's crop of Wheat. And I shall now take you with me, if I can, and show you the whole process of my simple cultivation, from this first digging, till I have cut and threshed and measured the produce. Don't let us leave these diggings, however, till I have shown you how they are done. They are two spits deep; and, after the pan is a little moved, the staple is turned upon it, and the second spit is gently laid uppermost, and in such a form that the frost may be felt right through the whole. Look: you can almost see down to the subsoil. This digging, then, is my first outlay. Half the acre being already in Wheat, I have had only half the acre—bear this in mind—only half the acre to dig and to pay for; and the price of that, at the average rate of 3*l.* the acre, is 1*l.* 10*s.* Well; thus lie these ridged intervals during the winter—higher than the tender Wheat, and so protecting it, and checking the drifting snow. The winter fallow over, I give my spring stirring with the fork, which moves, without damaging, the tender fibres; and I follow up that with the horse hoe, as often as the surface incrustates, and as long as the growing corn will permit. The crop being carried, last of all comes the forking and pulverising, and levelling for seed time. The two forkings and the hoeings *ad libitum*, I value at 20*s.* I pay great attention to what follows—namely, the putting in the seed. For my three rows of Wheat I make channels with a three-wheeled presser, the edges of which are sharper than usual, in order to cut through the land to the depth of 2½ or 3 inches. Boys or men follow, and drop single grains into the channels, about 2 or 3 inches apart; and I keep a sharp look-out that this is done faithfully. The seed thus lying deep on a hard bed, and the land being well drained, I am not afraid of the plants being lifted by the frost; so I cover over the seed, and close up the channels, with the roller.

"Be gracious, Heaven! for now laborious man
Has done his part. Ye fostering breezes, blow!
Ye softening dews, ye tender showers, descend!
And temper all, thou world-reviving sun,
Into the perfect year!"

"The hoe is still kept at work between the rows of the growing Wheat as long as it is safe; and then comes the last scene of all—the sickle and the harvest home. Sum up, then, the outlay for this crop, from first to last.

	£	s.	d.
One double digging	1	10	0
Two single diggings, with fork	1	0	0
Pressing, sowing, hoeing, carrying, threshing, rates and taxes	2	1	0
Two pecks of seed (5*s.*) the bushel	0	2	6
Total	4	13	6

"Such has been the process—such the outlay. The Wheat is now threshed: what is the yield? I have already had Wheat on the same acre of land for three successive years. Of the first year I took no account; but I have accurately measured the produce of the two last years, and the yield has been the same in both cases, namely 4 qrs. and 2 bushels:

	£	s.	d.
Four quarters and two bushels of Wheat, at 40*s.* per quarter	8	10	0
One ton and 12 cwt. of straw (at 2*l.* per ton) ...	3	4	0
Total amount of produce	11	14	0
Deduct outlay	4	13	6
Total amount of profit	£7	0	6

"To myself, as proprietor, then, this acre of Wheat land is worth 7*l.* 0*s.* 6*d.* To a tenant, renting at 40*s.*, or 50*s.*, or 60*s.* it would be worth accordingly. Would a tenant be satisfied with a net profit of 5*l.*, or 4*l.* 10*s.*, or 4*l.* the acre? Would the stout British farmer, who had 100 acres in Wheat, be content with a sheer gain of 400*l.*? Before I leave this summary of outgoings and returns, I must make two remarks. First, it will be seen that I have charged, under one head, the several items of pressing, sowing, &c., down to rates and taxes. I have made as minute a calculation as possible of what is the cost of each item to myself; but, as the amount of these items may vary—and, I believe, does vary in other places—some items being less, and others more than I have calculated, the total amount, on the average, being about the same, I have acted as I have done in this matter in order to avoid useless cavil. Secondly, I use no manure for my Wheat land; and therefore place the straw, as well as the Wheat, to my account of profits. It is beside the question here to speak of the other portions of my farm; but it will be as well just to notice that the same general principles of cultivation are applied throughout; and that by 3 feet intervals and 2 feet ridges, deep ploughing as well as digging, constant pulverisation and abundance of home-made manure, my root crops are enormous, and enable me most willingly, to purchase my own straw at 2*l.* a ton. In a case like this it would be intense folly, approaching to wickedness, to mislead by exaggeration. But I merely state a plain fact when I tell the reader that, with the exception of less than a quarter of Oats for my horses, and a little meal for my pigs—upon the produce of 11¼ acres, nine of which are pasture, I keep six cows and two horses, and fatten for the consumption

of my house as many pigs as I choose. The net profit of these 11¼ acres I reckon at very nearly 100*l.*"

The facts stated seem to claim the test of experiment from the arable farmer—and it is not improbable that he might find a deep soil, by treatment such as is here described, capable of yielding an annual and profitable crop of Wheat for some years, being at the end of that time exchanged for another section of the farm and restored to the ordinary farm management without any material loss of fertility.

Farming Essays (Second Series). By Hewitt Davis, Land Agent. Simpkin, Marshall and Co.

Many of the articles here collected our readers have already seen. They form an excellent continuation of the first series of essays published by Mr. Davis a year or two ago—and will we doubt not extend the reputation of their author, already so high, as an authority on agricultural subjects.

A Series of Tables on Draining, &c. By James Strachan. Oliver and Boyd, Edinburgh: Simpkin and Marshall, London.

Mr. Strachan has already presented the farmer with tables intended to facilitate those calculations in which either his business or his professional transactions involve him. The value to him of the present volume he will be able to estimate from the following statement of its contents:—1. Tables showing the number of roods and of rods of drains in any quantity of land from 1 pole to 100 acres, and from 4 to 35 yards, pp. 9—40. 2. Tables showing the number of tiles, 12, 14, 15, 16, and 18 inches long, required for from ¼ rood or rod, to 20,000 roods or rods, pp. 43—52. 3. Directions for constructing tanks and measuring their contents, p. 55—57.

Notices to Correspondents.

Cake Breaker: *A Scotchman.* There are many efficient cake breakers. See article Bruises, in "Blackie's Cyclopedia." Those in which the pinnacle form of tooth is adopted are the best. Green fodder may be cut up if a little straw at top and bottom be used to let it slide along the feed-box of the cutter.

Haymaking Machines: *C. R.* Our advertising columns give the addresses of makers. Your Turnip-seed will yield a good crop if sown on properly prepared land: its "antecedents" are not likely to affect the result.

Wireworm: *J W.* You should read the Paper, by Mr. Curtis, in Vol. V. of the "English Agricultural Journal," and you will see in what slight measure we are able to contend with this plague. Paring and burning occasionally is a good thing; folding sheep is a good thing; and you might, perhaps, stifle burn instead of paring and burning, which would equally destroy insects, at the same time that it would not dissipate the organic part of the soil so completely. Your course is better than the other for ordinary purposes; you must judge for yourself as to whether, under the circumstances, it may not be advisable occasionally to burn the old lea, before sowing Wheat.

Erratum: For "derive from" in the 10th line of the paragraph about American churn, col. *a*, p. 430, read "desire."

Markets.

COVENT GARDEN, July 13.

Vegetables are abundantly supplied. Strawberries and Hot-house Grapes are both plentiful, and the same may be said of Pine-apples. The supply of Peaches and Nectarines is still well kept up. Ripe Gooseberries fetch from 2s. 6d to 3s. 6d. per half sieve. Walnuts and Chestnuts are abundant; Oranges and Lemons though scarcer are sufficient for the demand. Young Carrots and Turnips may be had at from 3d. to 6d. a bunch. Potatoes fetch from 1d. to 2d. per lb. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Cinerarias, Lily of the Valley, Pinks, Carnations, Rhododendrons, Ranunculuses, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Lemons, per doz., 1s to 2s
Grapes, hothouse, p. lb., 2s to 5s	Oranges, per doz., 9d to 1s 6d
Peaches, per doz., 6s to 18s	— per 100, 5s to 12s
Nectarines, per doz., 6s to 18s	Almonds, per peck, 6s

Joshua Baker.

* From crop 1841, one farmer sold 4500 loads, of 252 lbs. each, from 36 acres, which is better than 14 tons per acre.

SMITHFIELD, Monday, July 8.

The supply of Beasts is but moderate, and the demand is tolerably good; consequently the best qualities are readily disposed of at advanced rates. Our top quotation is exceeded in a few instances for choice Scots. The number of Sheep is larger, and a reduction in price is submitted to on the average. Good Lamb is in demand, at fully late rates. Calves are more in request, and make rather more money. From Holland and Germany there are 560 Beasts, 1780 Sheep, and 205 Calves; from Scotland, 100 Beasts; from Norfolk and Suffolk, 1300; and 700 from the midland counties.

Beasts, 3328; Sheep and Lambs, 32,520; Calves, 245; Pigs, 295.

Friday, July 12.

We have a fair supply of Beasts, and the demand limited, consequently Monday's rates are barely maintained. With Sheep and Lambs we are well supplied, and lower rates are submitted to, especially for Lambs. Calves are again abundant, and make low prices. From Germany and Holland there are 284 Beasts, 770 Sheep, and 266 Calves; from Scotland, 100 Beasts; and 119 Milch Cows from the home counties.

MARK LANE.

Monday, July 8.—The supply of English Wheat to this morning's market was again exceedingly small, and was cleared early at 2s. per qr. advance. Foreign met a fair demand, at an improvement of 1s. to 2s. per qr. upon the prices of this day se'nnight.—Barley is the turn dearer.—Beans and Peas fully support our quotations.—In the value of Oats we observe no alteration.—The top price of Flour is raised to 40s. per sack.—The weather continues unsettled.

Friday, July 12.—The arrivals of English corn this week have been small, those of foreign moderate, with the exception of 14,810 qrs. of Wheat. There was a fair attendance at market this morning, but the disposition to purchase Wheat was checked by the firmness of holders. The sales effected were at a slight enhancement upon Monday's prices.—Barley, Beans, and Peas fully support our quotations.—Oats are a free sale at former prices.—There has been a good sale for foreign Flour during the week, at an advance of 2s. to 3s. per sack.—The prices of floating cargoes of Maize are nominally the same.—The cold and showery weather which prevailed early in the week has been succeeded by a somewhat warmer but gloomy atmosphere. Harvest is expected to be general in about three weeks or a month. Throughout the kingdom Wheat has been in improved demand, at an advance varying from 1s. to 3s. per qr. The accounts received this morning lead us to anticipate a considerable deficit in the ear in some important districts.

Liverpool, Friday, June 5.—Although the markets in the north of Europe were said to be scantily supplied with Wheat, the arrivals of foreign into this port, within the last 10 days, exceed 40,000 qrs. At our market to-day transactions were considerable, and with a free sale for investment all descriptions of English, Irish, and foreign realised fully 1d. per 70 lbs. over the rates of Tuesday last. Flour also met an improved inquiry, and States, Canadian, including French and Irish, maintained previous quotations. Oats and Oatmeal, upon a very limited retail demand, merely sustained late prices. In addition to the rains previously noticed, frequent showers have fallen, which are beneficial to the growing crops.——Tuesday, July 9.—The grain trade during the week has had an improved appearance. There was a healthy demand for Wheat this morning, at an advance of 2d. to 3d. per bushel on the rates of this day week. Grinding Barley improved 2d. per bushel, and grinding Peas 1s. per qr. Oats, Oatmeal, and Beans were held for full prices, and were scarcely so easy to buy. We have to note an advance of from 6d. to 1s. per qr. on Indian Corn. Prices: Wheat, English, red, per 70 lbs., 6s. 0d. to 6s. 6d.; white, 6s. 3d. to 6s. 9d. Barley, Scotch and Irish, per 60 lbs., 2s. 9d. to 3s. Malt, English, per qr., pale, 48s. to 52s. Oats, English and Scotch, per 45 lbs., 2s. 8d. to 2s. 10d. Beans, English, per qr., 27s. to 31s. Peas, do. do., 25s. 6d. to 26s. 6d.

Wanted, a Steam Plough.—The Advertiser has a small Engine, without Boiler, of 8-horse power.—Prices and particulars to be sent to the Editor of this Paper, who will forward them.

Already published, all strongly bound in dark-coloured Cloth.

"The labour and experience of a life devoted to the science of Horticulture."—*Vide Author's Preface.*

With an Appendix, describing a new and economical method of producing uniform Bottom-heat from Hot Water in Tanks, upon the most simple plan, with explanatory Diagrams, and Reference to Buildings now in successful operation; by which means, the "King of all Fruits," the Pine, and other tropical fruits and flowers, may be cultivated at less than half the expense of the old system.

London: Thomas Kelly, Paternoster-row; Simpkin, Marshall and Co.; and sold by all Booksellers.

ORCHIDS AND PITCHER PLANTS.

MR. J. C. STEVENS is instructed to include in his sale on TUESDAY next, a small importation of ORCHIDS from Spanish Main, South America, which has arrived in the best possible state, and consists of magnificent plants of Cattleya, probably Mossiæ and labiata, and some exceedingly fine specimens of Oncidium pupilio, well deserving the attention of growers; also two cases of Nepenthes of several species, just received from the East.—To be viewed on Monday, and Catalogues had.

SPECIMEN HEATHS, AND OTHER GREENHOUSE PLANTS—THE COLLECTION OF MR. W. J. EPPS, OF MAIDSTONE.

MR. J. C. STEVENS is favoured with instructions to sell by Auction, at his Great Room, 38, King-street, Covent-garden, on TUESDAY, July 16, at 12 for 1 o'clock, the above collection of ERICAS, which is admitted to be one of the finest in the kingdom. It numbers 80 specimens, all of which are in the best possible health, dwarf, bushy, and young grown plants, and which have received the highest awards both at the Chiswick and Royal Botanic Exhibitions. All the leading and best varieties will be found included, such as aristata major, ampullacea, splendens, Massoni, Hartnellii, ferruginea, propendens, tricolor retorta, metulæflora, &c. Also magnificent specimens of Ixora coccinea, Allamanda Schottii, Epacris miniata grandiflora, Stephanotis, Azalea, Boronia, &c., many of which, as well as of the Heaths, will be in fine perfection to exhibit through July, August, and September.—May be viewed on Saturday (some of the plants at the Chiswick Exhibition, and the remainder at the auction room), and on Monday, and Catalogues had.

BETWEEN TUNBRIDGE AND TUNBRIDGE WELLS, A SINGULARLY DESIRABLE MANSION, PARK, AND DOMAIN, IN ALL 800 ACRES IN A RING FENCE.

MESSRS. DAVIS AND VIGERS are directed by the Mortgagees, having the consent of the Assignees of Mr. Benj. Smith, deceased, to sell by Auction, at the Mart, on WEDNESDAY, July 17, at 1 o'clock, in two lots, the distinguished FREEHOLD ESTATE, known as the Great Lodge, or Colebrook Park Estate, situate in a remarkably healthy, picturesque, and favourite part of the beautiful county of Kent, beside the high road from Tunbridge to Hastings, four miles from Tunbridge and two from the Wells, and only about two hours distant from London. It comprises a very superior Residence, newly and expensively finished and decorated in the modern Tudor style, affording very handsome and most convenient family accommodation; comprising, on the first floor, six best chambers, seven secondary ditto, two Nurseries and Study; and on the ground floor, Dining Room, Library, two Drawing-rooms, and Conservatory communicating *en suite*, and by a Vestibule with an Inner Hall and Gentleman's-room, School-room, and most complete Domestic Offices. The principal rooms open on to an inclosed Terrace, laid out with Flower beds and an ever-playing Fountain, and adjoining are Gardens and Pleasure-grounds, and a beautiful Lake of five acres, containing trout and other fish. The House stands in a Park of 300 acres, and is approached in three directions by some miles of private roads, having lodges at the entrances. The remainder of the estate consists of profitable Woods and Plantations, and two Farms, with 14 acres of Hop Ground and Homesteads, four Labourers' Cottages, Keeper's Lodge, &c., in all 798 acres, 2 roods, and 19 perches of land. It is all freehold, and free of great tithe and land-tax. The whole is in hand, and in beautiful order, and the sale of the handsome Furniture will immediately follow the sale of the estate. The property may be viewed by orders from the Solicitors and Auctioneers. Particulars and Conditions of Sale will shortly be ready, and may be had at the Rose and Crown Hotel, Tunbridge; the Castle, Tunbridge Wells; of Messrs. Chantler and Crundwell, Land Agents, Southborough; and in London of the Solicitors, Messrs. Druce and Sons, Billiter-square; Messrs. Crowder and Maynard, Coleman-street; at the Mart; and of the Auctioneers, 3, Frederick's-place, Old Jewry, London.

NEAR TO TUNBRIDGE WELLS, KENT—50 Acres of picturesque Land, beside a good road from the Wells, and only 1½ mile from the Railway Station.

MESSRS. DAVIS AND VIGERS are directed by the Mortgagees, having the consent of the Assignees of Mr. Benjamin Smith, deceased, to Sell by Auction, at the Mart, London, on WEDNESDAY, July 17, at 1 o'clock, in one lot, a very eligible PARCEL of LAND, offering great attraction for residentiary buildings, and with a prospect of becoming valuable for a considerable building speculation, comprising 50a. 0r. 33p., of which 43a. 0r. 17p. are woodland, and 7a. 0r. 16p. are arable. The whole is freehold, and nearly free from tithe and land tax. The distance from Tunbridge admits of frequent and easy daily communication by railway with London and the south of England. Particulars and conditions of sale may be had at the Rose and Crown Hotel, Tunbridge; the Castle, Tunbridge-wells; of Messrs. Chantler and Crundwell, Land Agents, Southborough; of Messrs. Druce and Son, Billiter-square; of Messrs. Crowder and Maynard, Coleman-street; of W. Whitmore, Esq., Basinghall-street; at the Mart; and auctioneers' offices, 3, Frederick's-place, Old Jewry, London.

GREAT LODGE, KENT, FOUR MILES FROM TUNBRIDGE AND THREE FROM TUNBRIDGE WELLS.
ELEGANT FURNITURE, BOOKS, PLATE, LINEN, CHINA AND GLASS, AND ARTICLES OF TASTE, GREENHOUSE PLANTS, &c.

MESSRS. DAVIS AND VIGERS have been favoured with instructions from the Assignees of Mr. Benjamin Smith to sell by Auction, on the Premises, on MONDAY, July 22, and five following days, the entire FURNITURE and APPOINTMENTS of the above Mansion, the greater portion of which has been recently supplied by an eminent London upholsterer, designed with much good taste, combined with solidity and superiority in the manufacture, as follows:

On MONDAY, July 22, the Kitchen Utensils and Fittings of Domestic Offices, Furniture of Eight Bed-rooms, and the Nurseries.

On TUESDAY, two principal and three other Bed-rooms, Housekeeper's Room and Stores, Butler's Pantry, &c.

On WEDNESDAY, Entrance Hall, Study, Library (in antique oak), the costly Suites of the Drawing-rooms, Candelabra, Parisian Clocks, and a Pipe of Cider.

On THURSDAY, the Services of China, Glass, Plate, Plated Articles, Furniture of Dining-room, Fittings of Laundry, Stables, three sets of double Carriage Harness, &c.

On FRIDAY, the rare Collection of Exotic and other Plants, 30 Orange Trees, Boat, Iron Hurdles, Garden Tools, &c.

On SATURDAY, the Library of Books and Wardrobe of Linen.

The Sale to commence at 12 o'clock for 1 each day. To be viewed privately by order, on the 17th and 18th, and on the two days antecedent to the sale, on the production of a Catalogue, which may be had at 1*s.* 6*d.* each, to admit a party, at Mr. Nash's Library, Parade, Tunbrige Wells; of Mr. Gay, on the premises; and of the Auctioneers, 3, Frederick's-place, Old Jewry, London.

TO BE LET, at moderate rents, in Carmarthenshire, two genteel Residences—Dyffryn House, with three acres of Grass Land, and Careg Cenen, with from 300 to 500 acres of Arable and Grass Land, if required. Both places are within a drive of Swansea, to which the South Wales Railway is now open. For particulars, with a lithograph of Dyffryn House, apply to T. W. LAWFORD, Tirydail, Llandilo; or Messrs. ROWLAND, HACON, and ROWLAND, 38, Threadneedle-street, London.

FARMING STOCK.
GREAT LODGE FARMS, NEAR TUNBRIDGE, KENT.

MESSRS DAVIS AND VIGERS are favoured with instructions from the Assignees of Mr. Benj. Smith, bankrupt, to sell by Auction, at the Home Farm, as above, on MONDAY, July 29, and following day, at 12 o'clock, the whole of the LIVE AND DEAD STOCK, with the Implements, &c., ample for farming of 800 acres of Land, including 12 Horses, 6 Cows, 2 Calves, 4 Steers, 5 Heifers, 4 Sows, 12 Pigs, young Boar, Poultry, &c., about 400 tons of Meadow Hay in 14 stacks, Wheat, Beans, Peas, Straw, &c., modern Corn-drill, Haymaking Machine, Carts, Waggons, Ploughs, Harrows, and 600 Iron Hurdles, 10,000 Hop Poles, a quantity of Faggots and Cord Wood, and other valuable property.—To be viewed the day before the sale. Catalogues to be had on the Premises; at the Inns, Tunbridge and Tunbridge-wells; and Auctioneers' Offices, 3, Frederick's-place, Old Jewry, London.

PERFECT MODEL FARM TO BE LET, WITH IMMEDIATE POSSESSION.

MR. HURLEY, FARM AGENT and VALUER, is favoured with the Letting of a picturesque FARM, situate in Buckinghamshire, 16 miles from London, near the Great Western Railway, and close to a principal Corn Market, consisting of a first-class Residence, suited for a Gentleman, with Lawns and Carriage Drive to the door, good Homesteads, &c., and 53 acres of rich Land—46 Arable, 7 Lawn and Meadow—in excellent cultivation. A Lease of about 14 years can be had. Rent 110*l*, Tithe free. Also 8½ acres of rich Meadow and Arable Land, detached, with Garden, Orchard, and a Cottage, may be had therewith. Rent for the whole, 128*l*. Stock and Implements at a valuation.—Apply at the Agent's Offices, 62, Nelson-square, Blackfriars, London.

FIRST-RATE FARM TO BE LET, FROM MICHAELMAS NEXT.

MR. HURLEY, FARM, ESTATE, and LAND AGENT, is instructed to Let a capital FARM, with excellent House and Farm Buildings, situate 2½ miles from the Maidenhead Station, Berks, Great Western Railway, consisting of 490 acres—213 Arable, 231 Meadow, 41 Wood, and 5 sundry. The Land is most excellent, and in good cultivation. The present tenant has realised an independency upon the Farm. Being so much Meadow, a moderate capital only would be needed. Most liberal landlord. Rent, 700*l*. per annum; Tithe, about 5*s*. per acre.—For further particulars, apply (enclosing postage stamp) at the Estate Offices, 62, Nelson-square, Blackfriars, London.
Other smaller Farms (same owner) also to be Let.

THE MACCARONI FARM.—To be Let, from Michaelmas 1850, the above excellent Sheep Farm, the property of Lord De Mauley. Comprising a capacious Farm-house and premises in good repair, and in a central position; together with 502A. 1R. 11P. of Arable, and 29A. 2R. 37P. of Meadow Land, in the parish of Eastleach, within a ring-fence: also 17A. 2R. 13P. of Meadow Land, bordering the river Thames, by the town of Leachlade. A good road passes through the centre of the farm, which is distant from Leachlade 3, from Fairford 4, and from Cirencester 9 miles; the latter being a principal market town in the county of Gloucester.—For particulars as to rent, &c., apply to Mr. W. B. JOHNSON, of Pawlett, near Bridgewater, Somerset, and to view the Farm, to Mr. C. COSENS, of Hathcrop, near Fairford.

TO MARKET GARDENERS AND OTHERS.

TO BE LET, two miles from London Bridge, a Market Garden Ground, of about 20 acres, in excellent cultivation, plentifully supplied with water and every convenience for carrying on the business.—For particulars, apply to Mr. SAMUEL BRANDON, Paradise-row, Rotherhithe.

TO BE SOLD, on very advantageous terms, a Retail SEED BUSINESS in a good Market Town, with or without a small Nursery.—Address by letter to S. B., Crosby-hall Coffee-house, Bishopsgate-street, London.

FARM FOR SALE.

TO BE SOLD, in one of the finest parts of Berkshire, a small compact Farm of about 80 acres, with House and Buildings thereon. It is near several railway stations, and within less than two hours' ride of London, per the Great Western Railway.—For further particulars, apply to Messrs. LAWRENCE, Solicitors, Cirencester.

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long, 13 feet wide, 90*l*.; 21 feet long, 13 feet wide, 50*l*.; 12½ feet long, 10 feet wide, 30*l*. A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber boxes, Iron hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d*. per square foot.
CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.
Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

STATUES, VASES, FOUNTAINS, GARDEN ORNAMENTS, Coats of Arms, and Architectural Embellishments in Imperishable Stone, by VAUGHAN AND CO., 60, Stones-end Borough, London. T. J. CROGGON, late of COADE'S, Superintendent.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d*. per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d*. per foot. British Plate Glass, from 1*s*. 2*d*. to 2*s*. per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4*d*. per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s*. to 5*s*. each. Cucumber Tubes, from 12 to 24 inches long, at 1*d*. per inch. Lactometers, 7*s*. 6*d*. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d*. to 3*d*. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.
See the *Gardeners' Chronicle* first Saturday in each month.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.
These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.
Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.
A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	¼ in.	⅜ in.	½ in.	¾ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s*. 5*d*.	0*s*. 6*d*.	0*s*. 8*d*.	0*s* 10*d*.	1*s*. 0*d*.	1*s*. 2*d*.	1*s*. 4*d*.	1*s*. 6*d*.

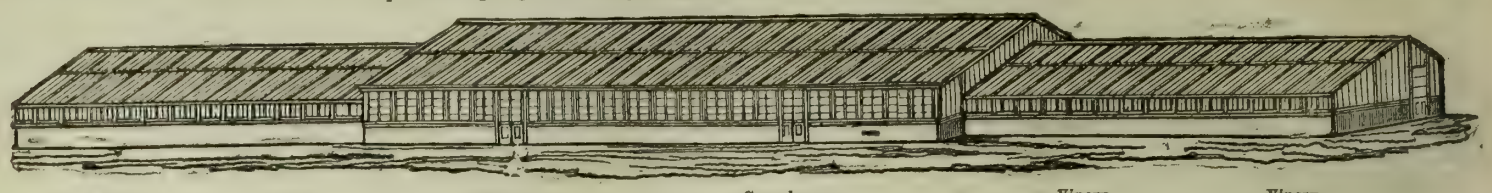
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3	

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.
All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.



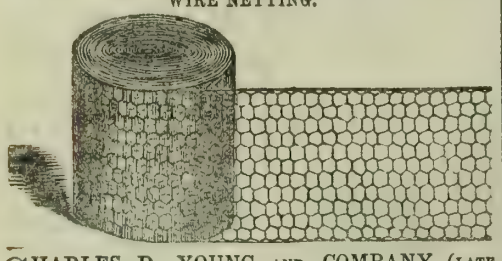
IRON AND WIRE FENCING, AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE PARK), And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of PLAIN AND ORNAMENTAL IRON AND WIRE FENCING, Park Entrance, Carriage and Field Gates, Wickets, &c.; Deer, Sheep, and other Hurdles; Hare and Rabbit-proof Wire Fencing; Iron Bedstead Makers to the Board of Ordnance; And Government Contractors.
The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility, and on the most moderate terms. Drawings made and estimates prepared, if required. The showrooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.



Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

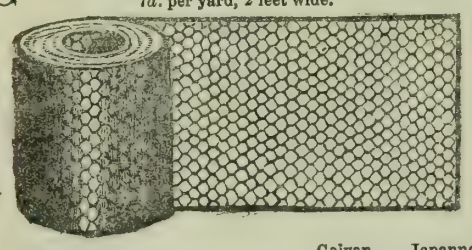
This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3 15	0
Do. of 100 yards, 24 ins. wide	.. ..	5 0	0
Do. of 100 yards, 30 ins. wide	.. ..	6 5	0
Do. of 100 yards, 36 ins. wide	.. ..	7 10	0

If more or less than a web is required, it would be charged at the same rate per yard.



This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2¼ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

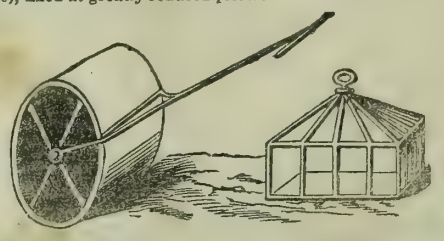
GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch ,, strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1⅝-inch ,, light ,, ...	8 ,,	6 ,,
1⅝-inch ,, strong ,, ...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

BARNARD AND BISHOP beg to inform those friends who are likely to visit Exeter during the forthcoming Royal Agricultural Show, that the Number of their Stand is 69, where samples of their various kinds of NETTING may be seen.



NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. LLOYD, 12, Salisbury-square, London, and receive one copy as a sample.

COTTAM & HALLEN, ENGINEERS, IRON FOUNDERS, &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON.

COTTAM and HALLEN having had experience in the erection of HOTHOUSES and CONSERVATORIES (made of Iron or of Iron and Wood combined), and from many improvements they have made during that time, can with confidence undertake to erect such buildings with economy and dispatch.

HOT WATER APPARATUS for heating the above and other buildings (of which they have constructed upwards of 3000), fixed at greatly reduced prices.

COTTAM and HALLEN have on show, at their repository, No. 2, Winsley-street, Oxford-street, a great variety of the following articles, for GARDENS, &c., at Greatly REDUCED PRICES, viz.:

Garden Rollers,	Hand-glass Frames,
Garden Engines,	Flower Stakes,
Garden Syringes,	Flower-bordering,
Watering Pots,	Flower Stands,
Garden Vases,	Garden Arches,
Mowing Machines,	Garden Chairs.

Every description of Work, both plain and Ornamental, in wrought and cast iron, for Gardens, &c. &c.

HORTICULTURAL TOOLS and AGRICULTURAL IMPLEMENTS of all kinds.

STRONG IRON HURDLES, strained Wire Fencing, &c.

Show Rooms at the MANUFACTORY, 2, Winsley-street, and 76, Oxford-street, three doors West of the Princess's Theatre.

BROWN'S PATENT FUMIGATOR for Horticultural or Agricultural purposes, in various sizes, from Ten Shillings to Ten Pounds.

DR. S. NEWINGTON'S HAND-DRILL HOES AND CULTIVATORS, to the frames of which are fitted Coulters for earthing up Potatoes and drawing out furrows for seeds. The chisel-pointed tines have moveable hoeing shares fitted to them, which can be removed when the tines are only required for stirring. These shares, which are made of any required width, hoe from 2 to 4 inches below the surface, according to the soil; on the shares being removed, the tines stir from 5 to 6 inches deep, a lad being enabled to hoe 2 acres of Turnips, &c., daily, cutting off every weed, and setting out the plants, reducing the price of labour from 4*s.* to 8*d.* an acre, or being able to hoe the crop six times, and much more effectually, for the same money now paid for hand-hoeing. Messrs. DUFAUR and Co. will exhibit, at the Royal Agricultural Show at Exeter, the following implements invented by Dr. NEWINGTON: A Drop Drill for horse power; the same for hand power; an implement to supersede broadcasting seed by hand for horse power; the same by hand power; an implement for broadcasting artificial manures or depositing it in rows by horse power; the same by hand power; a horse Dibble; a hand wheel Dibble; a subsoil Plough; a Scarifier or Cultivator; a paring Plough; a single horse Plough; hand drill Hoe and Cultivators, with various other fittings; a strike Plough.—Apply to Messrs. DUFAUR and Co., 21, Red Lion-square, London, who are the sole manufacturers and vendors of Dr. NEWINGTON'S inventions.

HYDRAULIC ENGINES, WATER RAMS, &c., on Improved Principles; Engines worked by Steam or Hydraulic power, to raise from 1 gallon to 1000 per minute to a height of 500 feet, and from a depth of 900 feet. Douche, Vapour, Hot-air, and all other kinds of Baths. Buildings, Conservatories, &c., heated by Steam, Air, or Water. Boring, Sinking, and Collecting of Water, &c. Towns supplied.

Direct to JOHN LEGG, Cheltenham.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

INDESTRUCTIBLE AND NOISELESS FLOOR CLOTH, for Churches, Public Offices, Damp Floors, &c.—WALTER and GOUGH, Patentees and sole Manufacturers, Patent Kamptulicon Works, Greenwich-road, near London.

HORTICULTULAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

THE LATE HEAVY RAIN having spoiled more than half the Strawberries grown on the old plan, the Advertiser begs to notice that the season for planting upon his system is close at hand, and suggests to those who are desirous of saving their Fruit in a clean and good state in future, that they purchase his STRAWBERRY TILES and have them put down as recommended in his pamphlet, when a crop may be depended upon of the best and cleanest description; but without the gardener can place the Tiles with the plants, inequalities of space will arise from error, which partly neutralises their effect, therefore no time should be lost. A pamphlet, with all particulars, can be had by sending three postage stamps, addressed to Mr. JOHN ROBERTS, 34, Eastcheap, London.

EMIGRATION TO AUSTRALIA.—New Line of Packets from Liverpool:

PETREL, 1200 tons, to sail on the 10th of September.
CONDOR, 1500 ,, ,, 10th of November.

A 1, new Ships, coppered and copper-fastened.—For Freight or Passage apply to the owners, GIBBS, BRIGHT, and Co., 1, North John-street, Liverpool.

STOVE GRATES.—PIERCE'S UNIVERSAL FIRE-LUMP GRATE, formed in one entire piece, requires no fixing, will burn either wood, coals, coke, or peat, producing a bright cheerful fire without waste from ashes or cinders. Price 22*s.* 6*d.* and 25*s.* Also, his Cottage Grates, formed in one mass of the finest fireclay, having strong iron bars and bottom, good hobs, and trivet.—Price 11*s.* 6*d.*—May be seen at PIERCE'S Pyro-Pneumatic Stove Grate Manufactory, 5, Jermyn-street, Regent-street, London.

BEAUTIFUL WHISKERS, HAIR, SKIN, AND TEETH.—Twenty Recipes indispensable to all:—For the best liquid hair dye extant; remedies for freckles, sun-burns, pock-marks, ringworm, and all other disfigurements; superfluous, weak, or grey hair, baldness, &c.; pomade and bandoline, for producing, beautifying, and curling the hair; amandine, for beautifying the hands, lips, and complexion; tooth powder, for purifying the teeth and breath; white enamel, for filling decayed teeth; liquid glue and cement, for broken china, glass, &c.; a certain cure for soft or hard corns, bunions, &c.; and a choice selection of French perfumery, all medically attested, will be sent free, on receipt of 25 postage stamps.—Address, Miss ROSALIE COUPELLE, Ely-place, Holborn-hill, London.

"The hair dye alone is worth 10 times the cost of all."—Miss Hill, Plaistow.

OLD FEATHER BEDS RE-DRESSED, AND PURIFIED BY STEAM WITH PATENT MACHINERY.—This new process of dressing not only removes all impurities, but by expanding the feathers the bulk is greatly increased, and consequently the bed rendered much fuller and softer.—Charge for dressing, 3*d.* per lb. Old and Mothy Mattresses effectually cured and removed, fetched and returned, carriage free, within five miles.—HEAL and SON'S List of Bedding, containing full particulars of weights, sizes, and prices, sent free by post on application to their factory, 196 (opposite the chapel), Tottenham-court-road, London.

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JULY 13, 1850.

SHAKSPEARE AND EARLY DWARF WARWICKSHIRE CABBAGE.

J. BUTCHER informs his friends and the public he is now sending out the above valuable sorts of Cabbage; for earliness and flavour they are first-rate. May be obtained in papers, 1*s.* each, of Mr. FREDERICK WARNER, Seed-merchant, 28, Cornhill, London; and J. BUTCHER, Nurseryman, Stratford-on-Avon.

SUTTON'S EARLY SIX WEEKS TURNIP is the best stubble Turnip, and may be sown any time in August with certainty of success.

A field of these Turnips, grown from Messrs. SUTTON'S *Seed by* E. W. MOORE, *Steward to* Earl RADNOR, *on poor soil at Coleshill, gained* Mr. PUSEY'S 20*l. prize, at the Farringdon Agricultural Show, in December*, 1849.

Messrs. SUTTON have the pleasure of announcing that they have just harvested a fine crop of the above valuable TURNIP SEED, which they are now delivering, price 10*d.* per pound, 5*s.* per gallon, or 36*s.* per bushel.

Carriage free to any Station of the Great Western, South-Western, or South-Eastern Railways.

Address, JOHN SUTTON and SONS, Reading, Berkshire.

CARNATIONS AND PICOTEES.

CHARLES TURNER begs to inform the admirers of the above beautiful flowers, that his extensive collection is now in fine bloom, and will continue to the end of the month. The Annual Exhibition will take place in the Grounds of the Nursery, on Thursday, July 25.

Royal Nursery, Slough, July 20.

TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL AND Co. are now prepared to execute orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, at the following prices:

50	best new sorts	25*s.*
25	ditto	15*s.*
12	ditto	9*s.*

Well established in small pots, or by post free.

NEW DWARF CHINESE OR LILLIPUTIENNE CHRYSANTHEMUMS.

This new and beautiful class are well deserving the attention of cultivators from their exceeding dwarf habit (not attaining more than 1 foot in height). The profusion of flowers with which they are covered, as well as the great variety and distinctness of colour, will render them general favourites. Strong plants for autumn blooming are now ready for sending out at the following prices:

9	fine varieties sent out last year (for the first time) for	9*s.* 0*d.*
13	do. raised by M. Lebois (and sent out for the first time this season), for	30 0

One sent over to the Trade when two are ordered.

The latter are figured in the last December Number of the "Annales de la Societé d'Agriculture et de Botanique de Gand," and are perfect gems, engravings of which may be seen at YOUELL and Co.'s Nursery.

Descriptive Catalogues of the above may be had on application. Printed directions of their successful and easy method of cultivating the Chrysanthemums for exhibition, &c., will be forwarded with all orders.—Royal Nursery, Great Yarmouth.

NEW LATE STRAWBERRY, WILMOT'S "PRINCE ARTHUR."

J. WILMOT, in offering this new variety of STRAWBERRY to the Public, is confident that it combines qualities which no other kind at present in cultivation does possess, being of delicious flavour, and coming in after the principal Strawberry season is over. It possesses the property of firmness of texture, so that it may be transmitted to any part of the kingdom without sustaining injury, as it may be kept for several days after being gathered, when fully ripe, without any indication of decay or loss of flavour.

"Prince Arthur" is one of the largest sized Strawberries, and a most abundant bearer; the foliage is small, and never exceeds 6 inches in height; the fruit is consequently fully exposed to the sun. Its dwarf habit requires it to be planted not more than a foot apart. The fruit is perfectly formed, of a rich scarlet, and colouring equally all over the berry. If planted at the distance recommended it will produce double the weight per acre of any other variety.

Strong plants will be ready for sale in September next, at 5*l.* per 100, on prepaid application only, to JOHN WILMOT, Isleworth, Middlesex; Robert Glendinning, Chiswick Nursery; William T. Atwood, Mortlake, Surrey; George Charlwood, Seedsman, Covent-garden; and Messrs. Hurst and M'Mullen, 6, Leadenhall-street, London.—Isleworth, Middlesex, July 20.

STATUES, VASES, FOUNTAINS, GARDEN ORNAMENTS, Coats of Arms, and Architectural Embellishments in Imperishable Stone, by VAUGHAN AND CO., 60, Stones-end Borough, London. T. J. CROGGON, late of COADE'S, Superintendent.

HOYLE'S SEEDLING PELARGONIUMS FOR 1850.

CHARLES TURNER will send out, early in the Autumn, strong established plants of the following distinct varieties raised by G. W. Hoyle, Esq. Ajax gained the 4*l.* and Ocellatum the 3*l.* prizes at the Great Seedling Pelargonium Show, Surrey Gardens, in June last, being two of the four prizes awarded on that occasion. Early orders will ensure first selection.

AJAX.—A noble dark variety, smooth, and of fine substance, lower petals rosy purple, top petals very dark purple, with even narrow margin of vivid crimson; very free bloomer; has been justly styled "The leading flower of the season." Price 1*l.* 11*s.* 6*d.*

OCELLATUM.—A great novelty, lower petals bright pink, with a distinct and constant spot of deep crimson; top petals deep crimson spot, shaded off with bright rose, white eye, free bloomer, and good grower. Price 1*l.* 11*s.* 6*d.*

MAY QUEEN.—A large, distinct, and pleasing variety. Orange-rose top petals, crimson blotch, shaded off with orange, the five petals have a delicate margin of pale pink; lower petals vivid rose; large well-defined white eye, very free bloomer, will be a great favourite on the home stage. Price 1*l.* 11*s.* 6*d.*

NECTAR CUP.—Rose, top petals rich orange-rose, with narrow pink margin, clear white eye, fine substance, good habit. Price 1*l.* 1*s.*

FLAVIA.—Orange-scarlet, the brightest in this class that has been offered, and makes a fine display on the stage, rather crumpled on the edge, and lower petals too long. Price 1*l.* 1*s.*

GENERALISSIMO.—Large and very attractive; lower petals salmon, with spots of a deeper colour, white centre; top petals very dark, rich, and velvety, shaded with lively orange, occasionally crumpled on the edge. Price 1*l.* 1*s.*

RUBIOLA.—Fine crimson scarlet of beautiful texture, dark spot on the top petals, rather deficient in breadth of petals. Price 1*l.* 1*s.*

CORINNE.—Light purple, very smooth and free bloomer, dark top petals. Price 15*s.*

ISIS.—A neat smooth flower, of good quality, very free bloomer, rose with white eye, and dark blotch on top petals. Price 15*s.*

CARDINAL.—Fine rich orange crimson, black blotch on top petals, very smooth, not a strong grower. Price 15*s.*

HEARTSEASE.—Scarlet rose, large fine shape and substance; but being inconstant, purchasers of the above will have a plant without charge.

Price 8*l.* 10*s.* for the set.

VARIETIES SENT OUT IN 1849.

CHRISTABEL (Hoyle).—Lower petals delicate pink, tinged with orange, rich blotch on top petals. Price 7*s.* 6*d.*

CUYP (Beck).—Claret, dark block on upper petals shaded off to the margin. Price 10*s.* 6*d.*

CONSTANCE (Foster).—Light bottom, with rich dark top petals, narrow margin of light. Price 10*s.* 6*d.*

EMILY (Beck).—Large bold flower, crimson, with dark blotch on upper petals. Price 10*s.* 6*d.*

FIELD MARSHAL (Symonds). — Crimson purple, dark spot on upper petals. Price 7*s.* 6*d.*

GIPSY BRIDE (Foster). — Rosy crimson, top petals dark blotch, with even narrow margin of crimson. Price 10*s.* 6*d.*

LOVELINESS (Beck).—Lilac-rose coloured bottom petals, dark rich top, white eye. Price 10*s.* 6*d.*

MAGNIFICENT (Foquett).—Large rich bright crimson, dark spot on top petals, free bloomer. Price 10*s.* 6*d.*

NANDEE (Hoyle).—Pink, upper petals very dark, white eye. Price 7*s.* 6*d.*

NONSUCH (Hoyle). — Deep lilac rose, upper petals dark blotch, lower petals novel crimson spot and feather. Price 10*s.* 6*d.*

PRINCE OF ORANGE (Hoyle).—Orange scarlet, spot on top petals. Price 10*s.* 6*d.*

ROSALIND (Beck).—Fresh-coloured rose, blotch on upper petals, white eye. Price 10*s.* 6*d.*

Or the 12 for 4*l.*

The following 12 varieties for 3*l.*—Alderman, Crispins, Conspicuum, Governor, Lord Gough, Lord Stanley, Narcissus, Painter, Pet, Pride of the Isles, Roweana, Satisfaction; or 10 of the above, with the choice of Magnificent, Gipsy Bride, or Constance.

Older varieties: 12 of the following for 2 guineas.—Alonzo, Ariel, Armada improved, Blanche, Belle of the Village, Brilliant, Cassandra, Centurion, Crusader, Cupid, Delicatissima, Gulielma, Lalla Rookh, Lamartine, Mont Blanc, Norah, Ondine, Rosamond, Star, Symmetry, Virgin Queen, Victory; or 10 with choice of Conspicuum, Narcissus, Pride of the Isles, or Rowena; or 9 with choice of Magnificent, Gipsy Bride, or Constance.

Also a fine selection of Fancy varieties at 12*s.*, 18*s.*, and 30*s.* per dozen, own selection. Catalogues may be had on application.—Royal Nursery, Slough.

MR. NORMAN respectfully begs to invite inspection of his superb Collection of CARNATIONS and PICOTEES, which are now in full bloom, and will, he thinks, repay the trouble of a visit. Two minutes' walk from the Arsenal Station—Trains every half hour from London-bridge.

Bull Fields, Woolwich, July 20.

VICTORIA REGIA.—A model of this gigantic and beautiful flower, its natural size, may be seen at the Studio of Messrs. MINTON, 36, Soho-square, representing this plant in all its beauteous stages, and copied by the kind permission of her Grace the Duchess Dowager of Northumberland. May be viewed, by cards only, on Tuesday, 23d inst., and following Thursdays, Saturdays, and Tuesdays, until further notice, between the hours of 2 and 6 o'clock.—Cards of admission may be had of Messrs. Colnaghi, Pall-mall; Ebers, Hookham, Mitchell, and Chappel, Bond-st.; and Same's, St. James's-street.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

BECK'S SEEDLING PELARGONIUMS of 1849.

For prepayment only, the first remittance to secure the first selection. Post-office orders are requested to be made payable at Brentford.

ROSA.—A bright rose-coloured flower of great smoothness and good form, a free bloomer, constant, and of excellent habit. Will prove a first-rate variety for all purposes. 30*s.*

MAJOR DOMO.—A very large rose-coloured flower, with dark clouded top petals; some of the blooms here measure 3 inches in circumference; free bloomer, and of strong habit. 21*s.*

SILK MERCER.—A very close compact-growing variety, free bloomer, and very constant; smooth silky flower of first-rate quality, ground colour rose, with deep maroon blotch on the upper petals. 21*s.*

PRINCE ARTHUR.—A medium-sized flower of excellent quality, very constant, and a free bloomer; rosy crimson ground colour, with dark well defined blotch on the upper petals, leaving a bright distinct margin; light centre. 21*s.*

DIANA.—This is very similar to Rosalind, but larger, and is at its best early in the season, whilst the latter variety is not at its best until quite late. 15*s.*

TYRIAN QUEEN.—If the large deep mulberry-coloured top petals of the flower had been matched with as good lower ones, it would have been first-rate; strong robust habit, and a free bloomer; a very distinct and constant variety. 15*s.*

Many other Seedlings might have been selected, such as "Little but Good," and others, but they have exhibited faults which make it necessary to try them another season. Incomparable will not be sent out until 1851. At present it is unequalled.

VARIETIES OF 1848.

CUYP.—A novel claret-coloured flower; soft, silky, cloudy blotch on upper petals, shading off to the margin; very free bloomer and constant. 10*s.* 6*d.*

EMILY.—A very fine large Centurion flower, of first-rate character for the home or exhibition stages, being a very free bloomer; quite constant, and of good habit. 10*s.* 6*d.*

GOVERNOR.—A most profuse bloomer, of a rich glowing purple, stiff in the petals, and well adapted for all purposes. Good habit and foliage. 10*s.* 6*d.*

LOVELINESS.—A striking flower, of excellent quality; a rose-coloured clean distinct crimson spot on the bottom petals gives it a decided and pure white eye, upper petals rich dark spot extending evenly upwards, and abruptly shading off into the edge; habit excellent. 10*s.* 6*d.*

PAINTER.—Novel and striking, from the great amount of colour on the lower as well as on the top petals; very free bloomer, and constant. 10*s.* 6*d.*

PET.—A middle-sized, stiff, smooth flower, of high quality; rich, dense, even-coloured top petals, with a very light and well defined edge, white eye, and pale rose lower petals; moderate bloomer and constant. 10*s.* 6*d.*

ROSALIND.—A large-sized fresh-coloured flower, a glowing crimson upper petal, with dark blotch; a large white centre, and lower petals light rose; free bloomer, constant, and good habit. 10*s.* 6*d.*

Foster's Gipsy Bride and Constance, 10*s.* 6*d.* each.

Foquett's Magnificent, 10*s.* 6*d.*; and Symonds' Field Marshal, 10*s.* 6*d.*

OLDER VARIETIES, AND OTHER RAISERS' FLOWERS

Twelve of the following varieties, including the box and carriage to London, will be sent out in October, for Two Guineas, well rooted in 3-inch pots, and ready for an immediate shift into a larger size:—Blanche, Centurion, Cassandra, Crusader, Delicatissima, Dorcas, Emilia, Gustavus, Gulielma, Lalla Rookh, Lamartine, Mont Blanc, Meleager, Minna, Ondine, Princess, Alonzo, Ruby, Rosamond, Star, and Symmetry.

Any twelve of the above are fit to compete at any exhibition, metropolitan or provincial. J. Dobson has invariably taken the first prizes at the great metropolitan exhibitions with the sorts herein advertised.

N.B.—Catalogues can be had on application.

Worton Cottage, Isleworth, Middlesex.

3 To Mr. Edwards, F.H.S., for Carnations
4 To Mr. Ellis, Woolwich, for the same
5 To Mr. Ward, Woolwich, for the same
6 To Mr. Wilmer, Sunbury, for the same
7 To Mr. Bragg, Slough, for the same
8 To Mr. Newhall, Woolwich, for Picotees
9 To Mr. Ellis, for the same
10 To Mr. Ward, for the same
11 To Mr. Bragg, for the same
12 To Mr. Wooder, Tulse-hill, Brixton, for a collection of Antirrhinums
13 To Mr. Spencer, Gardener to the Marquis of Lansdowne, F.H.S., for Peaches
14 To Mr. Fleming, for Elruge Nectarines
15 To Mr. Whiting, Gardener to H. T. Hope, Esq., for Black Circassian Cherries
16 To Mr. Gainsford, Brentford, for the same
17 To Mr. Kemp, Gardener to Mrs. Grillion, East Acton, for Bigarreau Cherries
18 To Mr. Ingram, Gardener to the Marquis of Salisbury, F.H.S., for British Queen Strawberries
19 To Mr. Beach, Hounslow, for the same
20 To Mr. Ball, Gardener to H. Rogers, Esq., Stagenhoe Park, Welwyn, for the third best-flavoured Melon (Napoleon green-fleshed).
21 To the Rev. Mr. Peck, Houghton Rectory, Huntingdon, for Shaddocks

N.B.—West's St. Peter's Grapes ought to have been shown in No. 2 E, and not in No. 4 E. There were some very fine exhibitions of Muscat and Cannon-hall Grapes, of which no notice could be taken in consequence of their extremely unripe condition.—In the only specimen of Peaches in pots exhibited, the fruit was very unripe.—An exhibition of 25 varieties of Roses, by Mr. Terry, Gardener to Lady Puller, Youngsbury, Herts, was disqualified on account of its containing the same Rose under two different names.—Only one collection of Conifers was shown; partly unnamed, and of little interest.—Achimenes Tugwelliana should not have been exhibited in the class of new plants. Luxembourgia speciosa has been shown in the Garden in former years.

GLASS WATER PIPES.

MESSRS. COATHUPES AND CO., GLASS MANUFACTURERS, Bristol and Nailsea, Somerset, continue to supply GLASS PIPES for the conveyance of water, &c., in lengths of from 3 to 7 feet, and from ½-inch to 4-inch bores; they provide also the necessary joints, which enable them to stand very considerable pressure.

PEACH AND GRAPE GLASSES.—These Glasses, placed over Fruit on the common wall, assist Nature in our cold climate. The Fruit grows to a larger size, and its richness is increased.

JAMES PHILLIPS AND CO. beg to say they have purchased the above Registry of Mr. HALLIMAN, and caution all persons from making or selling the same without their consent.

FERNS.—J. P. and Co. have succeeded in making a very neat style of Shade, with glass bottom (or stand), expressly for the growth of Ferns, which will be found much more ornamental than any previously made for the same description of plant. Prices and every information to be had of JAMES PHILLIPS and Co., 116, Bishopsgate-street Without, London.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

HORTICULTULAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

CROWN, SHEET, AND ROUGH PLATE GLASS FOR HOTHOUSES, CONSERVATORIES, &c.

The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.

100 and 200 feet cases of large Sheet Glass, from 2½d. per foot. Small ditto, 10s. 6d. per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1s. 3d. to 1s. 6d. per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7d. to 9d. per foot. HEATING BY HOT WATER.

EDWARD DENYER, NURSERYMAN, Loughborough-road, Brixton, within three miles of London, informs his kind patrons in general that his unrivalled Collection of ROSES, reaching to nearly 1000 varieties, are now in bloom and free to the inspection of all visitors, Sundays excepted. Orders taken at this time and executed in November next. Price of Standard Roses, 15s. to 20s. per dozen. Fruit Trees, &c., &c.

E. D. informs his friends that he has no Seed Shop in London.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, July 20.

MESSRS. KNIGHT AND PERRY feel themselves called upon to thank their numerous patrons very gratefully for the confidence with which they have recurred to them when in want of Gardeners, and beg respectfully to say that the scrutiny and vigilance they have always employed in selecting good and clever men (to which the almost invariable satisfaction that has so long attended their recommendations is mainly attributable) is, if possible, increased now; and the steps they have taken to arrive correctly at the professional and private character of those they send out as GARDENERS, FORESTERS, BAILIFFS, &c., induce them to undertake unhesitatingly to furnish first-rate men in these capacities whenever called on to do so.

EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON.

"THE FLOWER OF THE DAY" IS LEE'S NEW VARIEGATED SCARLET GERANIUM.—This fine bedding plant is very vigorous, and the variegation perfectly constant. The foliage is bright green, beautifully margined with silver, with a light horse-shoe, and an occasional pink tinge. The trusses are large, of a light scarlet (the most conspicuous colour), and the general effect it produces is elegant beyond description.

"THE FLOWER OF THE DAY" may be seen in bloom at LEE'S Nursery during the present month. On the 1st of August good established plants will be ready for delivery at 10s. 6d. each, with the usual allowance to the trade when three or more are ordered. Orders will be executed strictly in rotation.—Address, J. and C. LEE, Nursery and Seedsmen, Hammersmith, near London.—July 20.

50,000 CAMELLIAS WITH FLOWER BUDS.

JOSEPH BAUMANN, NURSERYMAN, Ghent, Belgium, begs to offer the following CAMELLIAS:

100	Camellias in 100 varieties,	1 foot high	...	...	£7	0 0
100	,, 50 ,,	do.	...	...	6	6 0
100	,, 100 ,,	from 1 to 2 feet high	...	10	0	0
100	,, 50 ,,	do.	do.	...	9	0 0
100	,, 100 ,,	from 2 to 3 feet high	...	12	0	0
100	,, 50 ,,	do.	do.	...	11	0 0
100	,, 100 ,,	from 3 to 4 feet high	...	16	0	0
100	,, 50 ,,	do.	do.	...	15	0 0

J. B.'s Camellias are of the best cultivation. A liberal discount to the Trade; see J. B.'s Catalogue.

STRAWBERRIES AND CELERY.—The season for Planting being close at hand, the Advertiser begs to remind those who are desirous of having clean Fruit, and in the greatest perfection, that no time should be lost in procuring Strawberry Tiles to place down when the plants are set, as without them the gardener cannot place them so exact as he otherwise could; consequently, the same advantages cannot be obtained. The satisfactory testimonials received from persons who tried the Celery Sockets last season warrants the Advertiser in hoping that they will be in use in every garden where a good and clean article is valued. Particulars can be had by inclosing three postage stamps to Mr. JOHN ROBERTS, 34, Eastcheap, London.

The Gardeners' Chronicle.

SATURDAY, JULY 20, 1850.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, July 23—Royal South London.....1 P.M.
WEDNESDAY, — 24—Royal Botanic ..... 3½P.M.
COUNTRY SHOWS.—Wednesday, July 24: Royal Berkshire Horticultural.—Thursday, July 25: Bath Horticultural, and Oxfordshire Horticultural.

FROM the moment when it was announced, upon the authority of the architects consulted by the Royal Commissioners, that the GREAT EXHIBITION in 1851 was to be smothered, at an incalculable expense, beneath a hideous dish-cover of fabulous dimensions, we feared that PRINCE ALBERT'S patriotic and magnificent design was practically at an end. But now that common sense and good taste have stepped in, and, consigning the monster to the Museum of the Institute of British Architects, have finally decided upon a most beautiful and original conception, of which Englishmen may well be proud, we no longer doubt that the great ends of the Exhibition will be accomplished. Mr. PAXTON'S building is planned with a perfect knowledge of what such a structure requires; and we hasten at once to remove from the public mind some of the false notions about it which a few correspondents of the daily press have endeavoured to promulgate.

That the structure is of marvellous beauty is not denied; it is even admitted that it realises the visions of Eastern fable. And yet the designs which have been published of it give no idea of what it will be found to be. But the beauty being admitted, that beauty is said to be accompanied by manifold faults. "The roof is flat," says one; "and therefore rain will come through;" but it happens that the roof is the reverse of flat; men might as well say that the roof of an ELIZABETHAN house is flat because it has flat ceilings. "You cannot ventilate such a place," says another; forgetting, or probably not knowing, that one-third of the area of the whole surface is capable of being opened. "The sun will roast exhibition and exhibitors," says another; as if the good people could be roasted through a canvas screen. "You will be drowned by the condensed vapour of your own breath," cries a third; "hogsheads of human perspiration will rain upon the devoted heads of those who enter the fated building;" forgetting the inconsistency of such an assertion with the pretended heat of the roof, condensation, we need not say, being only able to take place if the roof be cold. "Flat or not, the roof will let the water through," asserts a fourth; and yet if he had only as much patience as is required to look at a plan, and comprehend it, he would see that no building was ever designed in which the admission of water was more skilfully provided against. The last body of croakers maintains that "the building will tumble down—that no such structure can stand heavy gales, or bear heavily loaded floors." The same class of alarmists, doubtless, asserted that the tubes at the Menai would collapse; and, if they had had to judge of King's College, Cambridge, would have equally asserted that its roof would not stand till the scaffolding was down. The answer to these forebodings is, the result. The roof of King's College, Cambridge, has stood for centuries; and Mr. PAXTON'S roof would stand as long, although different in every possible respect.

For ourselves, we believe that the application of the principle which the genius and perseverance of Mr. PAXTON has now applied will have a large application in gardening; and that the mode of constructing hothouses will undergo an entire change in consequence of it. This we shall shortly endeavour to show, as soon as the plans of a most ingenious garden-structure upon the same principle shall have been made ready for publication.

In the meanwhile, now that the exhibition may be regarded as a certain event, we would draw the attention of those who are interested in garden operations to some objects which, in an improved state, might well form subjects of competition. In the first place, flower pots for sitting-rooms and other in-door use are much wanted, provided they can be made of beautiful forms, good materials, and at a cheap rate. Then, again, objects for decorating flower gardens, such as vases, obelisks, terms, &c., made of some very cheap material capable of bearing the winter; at present we have plenty of good patterns in this class, but their price puts them beyond the means of the middle classes. Another material that would prove highly useful would be cheap earthenware edging to flower beds and walks; what we now have is too dear, or too ill made, and from want of dovetails or some such contrivance, the pieces are troublesome to fix and very difficult to keep in true lines unless set in concrete, which is objectionable in the places where such edging is used.

Tools and implements form another class of objects in which ingenious men might make many great improvements. We have already patent scythe blades and patent spades, which are decided advances upon the ruder construction of those implements; but we believe many other tools are capable of great improvement, and we are not sanguine enough to believe that even scythes and spades have reached final perfection.

Good garden labels, and good materials for writing on them, are probably what would be prized above everything else. At present we cannot say that we have anything of the kind upon which much praise can be bestowed. The zinc ink is good, but the grey ground on which it is necessarily traced spoils it. Earthenware labels are brittle, and will not bear ink. Very nice ground plate glass labels are made in the glass works of St. Helens, but nothing has yet been found that is fit to mark them with.

In short there is an endless variety of garden objects to which ingenious men might advantageously turn their attention in anticipation of the great Exhibition of 1851; and we dare say that the public will soon begin to communicate suggestions, and make known wants, in the hope that such hints may be taken up by some of the clever and ingenious persons who abound in all the nations who intend to take part in the Exhibition. To foreigners such hints would be particularly valuable, because they would tell them what the objects are of which English purchasers are most in want.

THE most brilliant season in the annals of English Horticulture was brought to a close last Saturday by the third EXHIBITION IN THE GARDEN OF THE HORTICULTURAL SOCIETY, on which occasion there was such an assemblage of beautiful plants as no man ever saw before in the month of July. The last exhibition in the season has always hitherto been found much inferior to its predecessors; plants get out of condition; the races which decorate May and June fade and perish in July; gardeners have less leisure, and zeal begins to flag. This must have been severely felt elsewhere, if we are to judge from the complaints that have reached us of shabbily filled tables, and poor uninteresting specimens. It was not however so at Chiswick, for which it is evident that gardeners had reserved with care what they wisely withheld from other places. We say wisely, because a judicious man will always prefer to submit his produce to the inspection of those who can best appreciate its merit—and reward it. We suspect it has been discovered that the favourable opinion of the residents in the rich quarters of the West of London is of infinitely more consequence to gardeners than that of the respectable inhabitants of the northern and eastern suburbs.

The skill exhibited in cultivation was in many respects most remarkable, and in some respects highly instructive. We would particularly refer to some Cape Heaths (*E. metulæflora bicolor* and *Parmentieri rosea*), from Mr. EPPS, in which the effect of the unconfined air upon colour was most conspicuous. When compared with other specimens, the tints bore the same relation to each other as those of a sailor, fresh from a cruise, and a Manchester weaver, just released from the factory. Nothing could more conclusively confirm what we have so often insisted upon, that the greatest health attainable in plants is to be secured by the freest exposure to air. Colour is only a sign of health. Ill coloured flowers and fruit never come from plants in perfect condition. The want of ample air was no doubt the cause of the paleness of the fine Turmerics (*Curcuma cordata* and *Roscoeana*), from Syon, in which the intense violet and scarlet colours natural to the flower-leaves were scarcely observable.

A few novelties among Orchids mingled with crowds of well known favourites. Mrs. LAWRENCE produced the curved Angrec (*Angræcum arcuatum*), from the Cape of Good Hope, and a pale variety of the Insleay Odontoglot (*Odontoglossum Insleayi**), from which the brilliant colour of the spots was almost discharged. There was also a new Acinete, very near BARKER'S, from Mr. SKINNER, and a white Moss Cattleya from Mr. IVISON.

Among other races, the Victoria Water Lily, from Syon, in the form of a beautiful flower, and two magnificent leaves, each 5 feet 10 inches in diameter, was pre-eminent. The Java and saffron-coloured Ixoras (*I. javanica* and *crocata*) from Mrs. LAWRENCE were among the most brilliant bushes. A plant of the showy Medinil (*M. speciosa*) from Mr. FARMER'S gardener, was ripening its beautiful fruit, a result which Mr. CARSON has we believe been the first to obtain. The elegant Pleroma, with its broad round flowers of Tyrian purple, was produced by Mr. GREEN, in proof that some at least of the Melastomads will retain their splendid petals long enough to render them objects of much value.

Of the newer plants the most remarkable was the Willow-leaved Ixora (*I. salicifolia*) from Messrs. VEITCH, a charming stove plant with rich orange-coloured flowers. Less new and far inferior in colour, but most remarkable for the fantastic form of its flower, was the arched Leschenaultia (*L. arcuata*) from Lord KILMOREY'S garden. A large plant of the Emperor FRANCIS' Echites (*E. Franciscea*) from Mr. COLYER'S collection showed that no gardening skill can make an ugly plant handsome.

The fruit was abundant, and in many cases very fine; but the unripe state of some of the Grapes enabled inferior specimens to beat them. The most remarkable exhibition among this kind of fruit was a bunch of Black Hamburgh Grapes, *perfectly coloured*, from Mr. WILMOT, of Isleworth, which formed part of a crop now ripe *upon Vines that were loaded with ripe fruit last February!*

The beauty of the grounds of Chiswick-house, thrown open to the meeting by the noble President of the Horticultural Society, and a delicious day, enabled 7970 visitors to pass an afternoon in great enjoyment.

We are authorised to state that the regulations for the exhibitions of next year will be speedily taken into consideration; and to invite, as usual, suggestions for their improvement, where that may be practicable.

WE have before us the Catalogue† of the great sale of which, a week or two since, we announced the approach. The LATE KING OF HOLLAND'S PLANTS will be sold by auction, at the Hague, on Thursday, the 22d of August, and eight following days.

It is evident from this Catalogue, which by the way is a model for the imitation of others, that his Majesty gardened in a truly regal manner. Magnificent specimens of vegetation; plants capable of delighting the eye by their masses of flowers, or the sense of smell by their perfume, seem to have been the great objects of his care. Here we have beautiful Palm trees, noble Cycads and Plantains, crowds of Japanese Lilies, with forests of Oleanders, Camellias, Chinese Azaleas, Indian Rhododendrons, and Orange trees.

Although we must necessarily refer the reader to

* This is no doubt an Odontoglot, and not an Oncid.

† This may be had of BAILLIERE, 219, Regent-street, London.

the Catalogue itself for the particulars of this remarkable sale, we must spare room to mention a few of the lots. Lot 33 is a Black Cane (*Calamus niger*) 4 yards high, described as a magnificent specimen with several stems; 48 to 62 are Palmettos (*Chamærops humilis*), varying in height from 1 to 4 yards, said to be of admirable beauty, and in some cases without rivals; there are also many more lots of the same kind; 124 to 127 are specimens of the Bourbon Latania, from 2 to 3 yards high; 172, *Cycas Rumphii*, a very rare species in great beauty; 201, the Altenstein Zamia, 2½ yards high; 412, *Strelitzia augusta*, 5 yards high; 435, a Cinnamon tree, 5½ yards high; 1104, the bell-shaped Rhododendron (*R. campanulatum*), 2 yards high and 3 yards wide; 1231, &c., plants of Camellias, 3 and 4 yards high and 2 yards wide; 2056, &c., Orange trees; are chiefly small specimens, none of them appear to exceed 9 feet, and the majority are from 3 to 4 feet.

MUSA CAVENDISHII IN THE POLYNESIAN ISLANDS.

More than 10 years ago the late Rev. John Williams paid a short visit to Chatsworth, in order that he might, if possible, ascertain the most successful method of packing and exporting plants and seeds to great distances, and also at what periods or stages of growth it was most advisable to have them removed for that purpose; for as that gentleman was about to be entrusted with a mission to the Polynesian Islands he was exceedingly anxious to take something over with him, which, on its arrival in those parts, might prove permanently beneficial to the inhabitants. His Grace the Duke of Devonshire having most kindly given permission to supply from the gardens at Chatsworth anything which might be deemed suitable for the purpose, Mr. Williams consulted me as to the kinds of plants I would recommend. I suggested that it would doubtless prove one of the greatest blessings to the inhabitants of those far distant and little known lands, if the Chinese Banana (Musa Cavendishii) could be safely transplanted and established there, as from its dwarf growth it might be cultivated to any extent, and in almost any situation where the taller growing kinds could not exist, on account of the violent tornadoes which at various times sweep down nearly every lofty species growing there; also an immense number of plants might be grown on a very limited surface of ground, and consequently the production of healthful and nutritive food would in a few years become abundant, and thus with a very moderate attention, the overplus might by exportation prove beneficial to the inhabitants; and, lastly, encouragement would be given to cultivation, which would in a few years pave he way for the introduction of many other of the useful arts of civilised life.

Subsequently Mr. Williams sent to Chatsworth his son, who remained here for a month making observations and taking such instructions as he thought would prove serviceable to him. On his departure, two cases of plants were prepared to be taken out with him, in accordance with his Grace's wishes; one of these packages was filled entirely with young plants of the Musa Cavendishii, and the other contained several other plants which were thought likely to prove of real utility. More than 10 years have rolled away since this transaction took place, and from that time to the present little has been known or heard of the affair, beyond the arrival of the plants at their destination, and the melancholy close of Mr. Williams's merciful mission.

After the lapse of so long a time, when the circumstance had become partly obliterated from the mind by more recent matters, it was with no small satisfaction that I read in the *Samoan Chronicle* (which has been kindly sent me from those islands), the following interesting account of the spread and great utility of this Musa, originating from the stock then introduced—a statement fully according with my anticipations, and serving to show that the cultivation of this plant has been carried out in a most praiseworthy manner.

The great success which has attended this experiment, promising, as it does, to be of so much ultimate importance, will encourage all persons who may have opportunities of rendering such assistance to do so; it has stimulated me to further exertion in this way, whenever such may appear necessary.

The *Samoan Chronicle* says: "He who introduces but a single plant into a country may be considered a public benefactor. We look with interest on the magnificent Orange and Tamarind trees which still stand at Point Venus, on Tahiti, planted by Bligh; and on the Shaddock tree, which, till lately, stood at Huahine, planted by the hand of Cook. But the most humble native teacher who now conveys to other islands the Orange, the Lime, the Banana, Sweet Potato, Pine, Custard and Papan Apples, &c., is no less worthy of the thanks of our country than the greatest of our navigators. It is interesting to observe, that, when these worthy agents of our Missionary Society bring on board the mission ship their little odds and ends of property to embark on their mission of mercy to other islands, they have almost invariably a box of plants, or a parcel of roots and seeds.

"It must not be thought that the islands of the Pacific are now the solitary abodes they once were. They are visited by hundred of whalers and traders; and, consequently, it is of the greatest benefit in preserving the health of their crews to be able to get fresh supplies of vegetables and fruits. At the same time it confers a benefit on the natives, by giving in exchange for their produce our hardware, cutlery, and cottons. The benefit is even more extended in opening up markets for our home manufacturers.

"In after years it will be interesting to know who first conveyed to the several islands many of the finest tropical productions. Even now, short as the period is, it would be difficult to ascertain who first introduced many of them.

"Of all the foreign plants which have been introduced into Samoa, none have been more extensively propagated and valued than a species of Banana, previously unknown in the South Seas, although in Samoa alone upwards of 50 different species of the Musa are found. From the excellency of its fruit and its great weight, together with the adaptation of its lowness to resist violent gales, it promises to take the precedence of every other variety usually cultivated. Some notice of its history, therefore, is worthy of record.

"When our late lamented missionary, Mr. Williams, returned from England in the 'Camden,' in 1838, his Grace, the Duke of Devonshire, kindly supplied him with some cases of plants, in one of which was one designated 'Chinese Banana' (most probably the Musa Cavendishii, the origin of which is said to be the Isle of France). Mr. Williams not having a settled place of residence for some time after he landed, the cases were left under my care. Little vitality seemed to remain; but anxious to preserve, if possible, some of them, I had them carefully transplanted into my garden. This Chinese Banana was the only one which survived. In about twelve months it produced a bunch weighing nearly 100 lbs. From this single plant have sprung the thousands to be seen everywhere in Samoa; and they are fast spreading in other groups east and west. It is surprising to see in the short space of 10 years a plant so extensively propagated. But when we calculate, by geometrical progression, what a plant, which will average but 6 suckers a year, will eventually produce, the result is amazing.

"The value of the Banana in these seas can scarcely be estimated. What Baron Humboldt says of it in Mexico may be quoted here and applied to Samoa. He doubts whether there is any other plant on the globe which in so small a space of ground can produce so great a mass of nutriment. Eight or nine months after the sucker has been inserted in the earth, the Banana begins to form its clusters, and the fruit may be gathered in less than a year. A spot of 1076 square feet may contain at least from 30 to 40 plants, which in the space of a year, at a very moderate calculation, will yield more than 4410 lbs. avoirdupois of nutritive substance. The produce of the Banana is to that of Wheat as 133 to 1, and to that of Potatoes as 44 to 1." *W. Mills.*

DISEASES OF PLANTS.

(*Continued from p.* 436.)

Genus V.; *one species.* Rhachitis.—There are plants, especially Gramineæ, and, above all, Wheat, which, from the vigorous state of their early growth, gradually turn yellow, the leaves twist and curl, and the knots of the stem acquire an extraordinary size; the Wheat then ceases to grow, and remains often scarcely 18 inches in height, instead of above 40, which it ought to have. This deformity giving it at first sight some resemblance to that which is called rhachitis in animals, I have given the same name to the disease in Cerealia. The seeds are changed into a monstrous excrescence. It differs from ergot in that the latter has not the general deformities of the rhachitis. I have occasionally seen other plants similarly stunted, with excrescences on the stalk, but I cannot say whether or not they belong to the same category as the cerelia afflicted with rhachitis.

Roffredi is of opinion that the ergot does not contain a single one of the little worms which others have pretended to have seen, but only their eggs. He found the diseased grains full of filaments of extreme tenuity, branched and intertwined, upon which he found a number of little globular and oval bodies. On sowing bad seeds with good, several of the plants appeared rhachitic. The bad seeds contain eggs of the little worms, which, he believes, as they are hatched, attach themselves to the roots, crawl up the stems, and then fix themselves in the ear, causing each grain to be converted into a gall. The disturbance of the sap occasioned by the worms in their ascent causes the rhachitis. If these observations of Roffredi were fully confirmed, and that the constant presence and bite of the little worms were proved, the disease should be classed among lacerations. But as the co-existence of these insects with the rhachitis is not generally recognised, and as some deny that there are any in the ergot, I have preferred placing both diseases in the present class. Roffredi has proved that rhachitis as well as ergot is contagious, and the careful separation of the diseased grains from the seed corn, is therefore, in this case, also a necessary precaution.

Genus VI.; *one species.* Asphyxia.—*Asphyxia* in animals is defined to be a continued failure of the animal and vital powers. Something of the kind may be observed, although rarely, in plants caused by the state of the atmosphere. Thus a long continued dry air, independently of the action of heat, will kill plants by depriving them of the nutriment they derive from a humid atmosphere. A plant placed in an atmosphere deprived of carbonic acid gas will die, so also in a vacuum; and the experiments of many physicists show that seeds will not germinate in gas azote, and that adult plants perish in it. We may conclude that a plant suffers in proportion as the air is deprived of oxygen, and languishes. How that happens we do not exactly comprehend. From want of sufficient knowledge of the internal mechanism of plants, we do not know what is precisely the effect produced on them by vitiated air. In general the disease is, however, accidental, and produced artificially, so as not to admit of much calculation. It is however certain, that plants closed up hermetically, although light be given to them, perish if the air be not renewed. The Sensitive Plant, placed in gas azote, loses its sensitive properties, and perishes by dying. All plants placed in nitrous gas languish and die.

Genus VII.; *one species.* Rot.—I designate by this name a disease which I have only seen on the bulbs of the Hyacinth. It commences externally, and generally at the crown of the roots the scales become soft and resolve into a glutinous paste. It gives out a most fœtid odour, though different from that of ulcers. The disease is contagious. Although the symptoms are external, I have reason to believe that they only indicate the last stage of the disease. For I have sometimes observed the outer scale intact, whilst the internal substance has been quite rotten. This malady affects bulbs more when out of the earth than at any other time. I have been quite unable to guess at its origin.

Genus VIII.; *one species.* Contagion.—It is well known that there are some plants which will languish and die from vegetating in the vicinity of others which exhale some matter injurious to them. How this happens, whether it be that the matter exuded penetrates, in the form of a humour, among the smaller fibrous roots, corrodes their sides, or chokes their suckers, remains unknown. The one and the other may both take place. In the meantime we see that Wheat suffers from the vicinity of the Erigeron acre, *L.*, Oats from the Serratula arvensis, *L.*, Flax from the Euphorbia peplus, *L.*, and Carrots from the Inula. If it be said that this is owing to a diversity of growth, one planting having a more vigorous vegetation, robbing the other of its food, I would beg attention to another phenomenon. How comes it that, when certain kinds of trees have perished, leaving but a few fragments remaining, no other trees of the same kind can be replanted successfully, unless the soil be first raised and burnt? Possibly this may be caused by the nature of the soil, which having been hurtful to the former trees, will also be to those which succeed them. Finally, we see that sound fruits placed amongst rotten ones will contract the disease, even if still adhering to the tree on which they grew. The same thing happens to bulbs of Onions, Hyacinths, &c., among which a rotten one placed in contact with a sound one will communicate to it the disease.

VILLA AND SUBURBAN GARDENING.

The object to be kept in view in arranging and planting a small garden is unquestionably variety. Attempting too much in any one particular branch leaves others either neglected or curtailed. It is true that every one has his own peculiar tastes and prejudices, and these necessarily interfere with the proper arrangement and division of the different parts of a garden; but it must be allowed that variety is the soul of gardening, and not less so in small than in large places. The peculiar taste of the proprietor should therefore, in some measure, be rendered subservient to the amount of pleasure which his family and friends are to reap from a proper distribution of subjects. When in flower a garden of Roses alone is admitted to be beautiful. Few will be found to detract from the loveliness of the Rose, but it would indeed be a morbid taste that could see no beauty in the rest of the vegetable kingdom. I apprehend, therefore, that the majority of those who delight in gardens—and who does not?—would prefer a continued succession of bloom in all seasons, so as to keep the eye always delighted, and the mind ever gratified. The business of the villa gardener then must be to consider well every step he takes; and every plant he commits to the soil should have been previously well weighed, and every point relating to its ultimate growth and effect maturely considered. The amateur is too apt to plant without forethought, and many of the objects he has looked forward to admire, are killed or smothered by others of more rapid and luxuriant growth. He should therefore know something of the dimensions plants are likely to attain. His little space requires great economy in the distribution of the subjects he cultivates, and much judgment in the selection of them; and therefore, instead of attempting to produce quantities of one kind of plant, to the exclusion of others, it would be wise and more satisfactory to limit the numbers of any particular kind, and thereby afford space for greater variety. He ought especially to avoid the too abundant introduction of rude growing plants; but, on the other hand, he need not confine himself to too small plants; these would produce a monotonous effect. A knowledge of the size which plants are likely to attain, together with the hints I have thrown out, may enable him to distribute his subjects so as to economise his ground, and, consequently, to produce a greater variety on the same space. *Pharo.*

Home Correspondence.

Purification of Water.—"C. D." has made inquiry relative to the purification of muddy pool water. I

understand by "pool," a village pond. It appears that cattle have access to it. The two points suggested by "C. D." are—can such water be filtered? and what would be the best kind of filter? Undoubtedly such water can be filtered, even through a common earthen filter. It has been done in all parts of the country. The other inquiry is more serious. First of all the pond should be fenced in with posts and rails, and thus prevent cattle and probably carts either going into it or passing through it; then a tank should be made in the deepest part of the pond that would hold about 3000 gallons of filtered water. Near the top of the tank let there be built in the brick-work a slab filtering stone—Ransome and May's patent stone would answer—or any good filtering stone; and then a similar stone at the top of the tank about the same size. The water would thus be made remarkably pure. The filter would want no cleansing; the accumulations on the upper stone might be removed in an hour once in six months; and, while there is water in the pond to filter, there would be a tank of excellent water. As to the pond being on the chalk, that is of no consequence; a tank properly made would do much less injury, as to the chances of leakage, than digging fonndations for the walls of the circular filter as suggested by your correspondent. Layers of quick-lime and clay would effectually plug the water from escaping, either where posts have been driven in or where damage may be done by the construction of a tank. The expense of tank, stones, fence, and pump, would be within 35*l*. The pump on the margin of the pond could be connected with the water in the tank, and a trough placed low down, under the mouth of the pump, for cattle to drink out of. Thus, every end would be accomplished, and the benevolence of "C. D." richly compensated. *A Friend to Pure Water.*

The Potato Disease has made its appearance in this locality. It was first noticed on the 8th inst.; since then it has progressed up the stalk from the set. The tubers are almost covered with small white spots, apparently some fungus, more particularly that portion to which the haulm is attached. *George Summers, Stoke Wake, near Blandford, Dorset.*——The disease has began to show itself in this part of the country (Renfrewshire, N.B.) much about the same time and in the same manner as it did last year, namely, the portion of the young stems nearest the old sets begin to get discoloured with a brown-like rust, which spreads upwards to the surface of the ground, showing that this kind of disease arises from the old set being affected before it is planted. I noticed disease about three weeks ago on the young stems of some Potatoes placed in a Pansy-bed as traps for wireworm; the soil of the bed was fresh loam, with about one-third charred loam, and free from all manures. The Potatoes were to all appearance quite sound when inserted, although they were picked from amongst a quantity of diseased ones. I neglected to examine my traps till they had made growths 2 inches above ground. When pulled up, six out of ten were found to be more or less diseased. Since then I have examined several gardens and fields of Potatoes (which are very numerous in this part of the country this season), and in all cases where the seed has been selected from amongst diseased Potatoes, the evil is showing itself below the ground. Should the present fine dry weather continue, it may not increase much for some time, but the first dull wet weather will, I fear, tell the farmers a mournful tale of their beautiful Potato fields. *A. B., Paisley, July* 16.

Puzzle.—There is a tree which if spelled with every letter erroneously or correctly, the pronunciation offers to view its true name. Required, the same in English. If unanswered in the next Numbers, a definition will appear within a month. *H. S.*

Loudon's Hortus Britannicus.—In your review of the new edition of this book, you mention the alphabetical arrangement of the Supplement as though it had been introduced by me. This was not the case, as it was first adopted in the additional Supplement published in 1832, and the arrangement was followed in the Supplement of 1839, and in the supplementary lists. When, therefore, Messrs. Longman applied to me to amalgamate all the five supplements into one, and to add the new plants, I naturally followed the arrangement of the previous supplements, particularly as I was told that form was generally liked by gardeners. *J. W. Loudon, Bayswater, July* 16.

Names of Roses.—One of your correspondents inquires into the origin of the name of a Rose commonly called in this country "Chénédolé." I fully enter into what I suppose to be his feelings, that, as an admirer of the beautiful varieties of the Rose, he is anxious to learn what he can of the tastes and pursuits of those who, by producing them, have so much added to our enjoyment. The names of the Roses are, in many instances, plainly suggestive of this sort of information. Thus, it is impossible to suppose that the cultivators who produced the Roses named "Duchesse d'Angoulême," and "Duchesse de Praslin," respectively, were not endowed with sentiments and feelings which led them strongly to commiserate the sufferings and the sorrows of those great personages, when they associated the names with objects of their own so delicate, so beautiful, and so fleeting. The Rose whose name is, when properly spelt, "Chênedollé," was most probably the production of a cultivator of Normandy, a country not surpassed by any other in the richest varieties of the Rose. Doubtless this person participated in the general admiration of the great poet of the same district, and was willing to testify his respect by giving the name of the bard to his own most beautiful production; thus enriching the poet's chaplet with a garland peculiarly his own. Charles Pioult Chênedollé was a very distinguished poet of France—he was born at Vire in Normandy, in 1769. He left France on the outbreak of the Revolution, resided for several years in Belgium and Holland, and returned to his own country when Buonaparte removed the interdict from the refugees. His great poem is entitled "Le Genie de l'Homme." He also translated the "Odes of Horace," and left in manuscript an epic poem called "Titus, or Jerusalem Destroyed." In the reign of Louis XVIII. he was decorated with the cross of the Legion of Honour, and was appointed Professor of Belles Lettres in the Lyceum at Caen. He died at his own château at Coisel, near Caen, Dec. 2, 1833. Your readers may refer to the "Biographie Universelle" for further particulars. That work is the source of my information. P.S. I shall be glad to know if any of your correspondents can inform me of the origin and meaning of the names "Phaericus," "Armosa," "Vitellina," "Devigne," "Ohl." *M. C.* [Devigne may be a misprint for Sevigné.]

Cuthill's Black Prince Strawberry.—It may be interesting to know that, notwithstanding spring frosts and easterly winds, I gathered from plants of the Black Prince, grown in the open air, a few fruit on the 1st and 2d of last month, and on the 5th I surprised some visitors by a small dish of them. They grew close to a south-east wall, without tiles; but if they had had the advantage of those contrivances, advertised by Mr. Roberts, I expect they would have been much earlier. It would be very desirable that, in his forthcoming publication, Mr. Cuthill should give directions how to make the later portion of the crop of this (his favourite) Strawberry swell to an average size. *John Abell, Limerick, July* 16.

Summer Pruning the Vine.—Am I to infer from Mr. Lovell's article that he condemns "summer pruning" *in toto*? if so, he may, with as much propriety, condemn any pruning whatever. He has criticised with undue severity the instructions in the Calendar as regards the Peach, and made observations altogether impracticable relative to the Vine. No man, I should imagine, ever stopped a Vine shoot for the sake of a good stock of laterals. I admit that they are produced; but he who grants them an existence long enough to become "spindley," should be classed with the gardener who leaves his wall trees neither summer nor winter pruned, nailed, or tied, until April. That the leaf of a lateral performs its offices differently from other leaves is very questionable; but the fallacy of attempting to grow Vines in fruit-bearing perfection without "stopping," is too obvious to require comment. *W. Toogood, Southampton.*

Instinct of Birds.—A goldfinch had been reared, by the young family of the groom to Sir Augustus Warren, Bart., of Warren's-court, to be exceedingly tame, and was a most beautiful singing bird; the eldest son of the family came to see his father and mother from Macroom, where he keeps an extensive cloth shop, and was so attracted by the beauty of the little songster that he, with great difficulty, prevailed on the young children to part with it. He accordingly took it away late in the evening, the cage being covered with a cloth, and carried him safely to Macroom, where he received every attention, but all in vain; no feeding, no coaxing, nothing could induce him to sing a note; he evidently was pining for his young companions. This went on for some time, the little bird every day getting worse, when, fortunately for all, one day his door was left open, and in a very short time afterwards the young family near Warren's-court were made happy by their little favourite's appearance, perched on the dinner-table, and showing by every testimony in his power the happiness and delight he experienced on seeing his old friends. It was mutual. He is now in perfect health, sings as before, and certainly will not be parted again. Now, Warren's-court (a bird's flight) is six miles from Macroom, the cage was covered up, it was night when he was conveyed away; and was not his coming home wonderful? *J. B. Warren, Warrenstown.*

The Cuckoo.—I beg to inform "W. H. B.," that I have remarked the peculiar note of the cuckoo, mentioned by "Este," for these last three seasons early in May; and this season more than usual. Now I think this is much too early for the young cuckoo to cheer us with his song. *J. L. M., Tonbridge Wells.*

The Building for the Exhibition of 1851.—Would it not be possible to convert this into a "winter garden," instead of removing it, as suggested, and intended by the commissioners? Glass is cheap enough; and I think such a thing would be an acquisition to the "lungs" of London. *J. L. M., Tonbridge Wells.*

Phyteuma orbiculare is now in flower in my garden, making the third season in which it has bloomed since I removed it from a bank on the Sanderstead road, about two miles south of Croydon, in Aug. 1847. The weather was then extremely dry. I raised it as well as I could with a trowel, and by care and moderate watering I kept it alive. I however lost sight of it for the season, but it came up again in 1848. The plant has gained strength ever since. Its close herbage occupies about the space of a dessert plate, from which rise 17 fine heads of bloom, on stems at least as many inches high; three (making 20), have been gathered. Sanderstead Down, and some of the neighbouring banks, abound with tiny specimens of Phyteuma. We have also on Duppa's-hill a tolerable sprinkling of Jasione. *John Towers, Croydon.*

Wasps.—On the 4th of June last, J. Strutt, Esq., of Budge-hill, Belper, offered to give a penny for every wasp which might be caught on or about his grounds, and brought to his steward, from that day to the 14th of the same month. When the day arrived, it was found that the steward had received no less than 1094 wasps. This has proved very effectual, not more than two or three wasps having been seen about the ground for several weeks past. *Q. R., Belper, July* 16.

Bees.—One of your correspondents asks if a deficiency of drones has been observed this season in the stocks of bees? I have suffered from too large a supply. A well-peopled hive threw me a swarm early in June. I put a glass upon the old stock, to prevent a second swarm coming off, but was surprised to find that not a single bee ascended into the glass, although there was a piece of clean white comb in it ready for them. After three weeks had elapsed, I noticed that the glass became damp, and finally water ran down the sides. At this season such a state of things is unusual, and as I further noticed but few bees going in and out, I resolved upon an examination. The hive was weighty, and contained a swarm of last year; therefore I knew that age had nothing to do with the case. I intoxicated the bees with the magic fungus, and great was my surprise to find that the hive was peopled with drones, the average number of workers, as far as I could count them, being one-fourth. The hive contained honey in abundance, the usual allowance of bee-bread; but the brood cells were almost entirely filled with drones. Now this hive could not have lived through the winter, if it even lingered to its commencement. The bees could have neither destroyed the drones nor fed them; the drones, I presume (according to authorities), could not have fed themselves; all would have died, and the mortality of the hive would have been attributed to the death of the queen, or any cause but the right one. I need not say I picked out all the working bees and added them to another hive, and interred the queen and the drones whilst in their inebriated state. If I might venture to advise your correspondent, I would suggest that he should catch some drones from the mouth of one of his hives that shows a plentiful sprinkling, and put them in a glass till the evening; then add them to his swarm, which will receive them readily and cannot thrive without them. *A. L. M., Spinfield.*

Societies.

Horticultural, *July* 13: Garden Exhibition.—If any one portion of this in all respects excellent July exhibition can be said to have attracted more attention than another, it was the fruit, of which there was an extensive and grand display. Pine-apples, though not remarkable for very great weights, were numerous and handsome. Black Grapes were generally well coloured and quite ripe, but as much cannot be said of white Grapes; for notwithstanding the intimation made in the schedule, that "all fruit must be sufficiently ripe for market, and well coloured," &c.; nearly the whole of the Muscats were far from being ripe. Indeed so extremely unripe were some exhibitions of this Grape, that no notice could be taken of them by the judges, although in other respects they were very fine and worthy of a prize. To this censure, however, there were one or two splendid exceptions, whose merits will be pointed out presently. Peaches and Nectarines were well swelled, and, in general, finely coloured; and there were some beautiful dishes of Strawberries and black Cherries. Among Melons the Bromham Hall had the superiority, as far as flavour is concerned. This is the second year in which it has gained the first prize for the best flavoured Melon.

Among Pine-apples, Mr. Jones, gr. to Sir J. J. Guest, Bart., had a Queen finely formed, but perhaps hardly ripe enough, weighing 5 lbs. 9½ oz. Mr. Drummond, gr. to C. H. Leigh, Esq., of Pontypool-park, a Ripley Queen, 5 lbs. 14 oz.; Mr. Higgs, gr. to J. H. Burchard, Esq., of Putney Heath, a Moscow Queen, 4 lbs. 12½ oz.; and Mr. Wilmot, of Isleworth, an old Queen, 3 lbs. 5 oz. These were all beautiful fruits, and were rewarded in the order in which they stand. Other Queens consisted of 12 fruit, weighing respectively 5 lbs. 10 oz., 5 lbs. 8½ oz., 5 lbs. 4 oz., 5 lbs. 0½ oz., 5 lbs., 4 lbs. 13½ oz., 4 lbs. 12½ oz., 4 lbs. 12 oz., 5 lbs. 10½ oz., 4 lbs. 5½ oz., and 4 lbs. 4½ oz., from Mr. Drummond; five fruit, the heaviest 4 lbs. 14 oz., and the lightest 4 lbs. 2½ oz., from Mr. Jones; and a fruit, 2 lbs. 13 oz., from Mr. Henderson, gr. to Sir G. Beaumont, Bart., who had also an Antigua Queen, weighing 3 lbs. 10½ oz. The best Providence, a noble fruit, was furnished by Mr. Spencer, gr. to the Marquis of Lansdowne, at Bowood; it weighed 9 lbs. 13½ oz. The next best was a cockscomb-crowned fruit from Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, weighing 8 lbs. 6 oz.; and Mr. Brewin, gr. to R. Gunter, Esq., of Brompton, had a large crowned fruit, weighing 8 lbs. 8 oz.

Grapes.—Among private growers, the best Black Hamburghs were contributed by Mr. Holmes, gr. to S. Garrard, Esq., of Putney-heath; the second best by Mr. Haywood, gr. to G. R. G. Goodman, Esq., of Roundhay, near Leeds; and the third best by Mr. Henderson, gr. to Sir G. Beaumont, Bart. Among Market Gardeners, Mr. Harrison, of Oatlands Palace, Weybridge, was first; Mr. Davis, of Oak-hill, second; and Mr. Corney, of Edmonton, third. These were all good exhibitions of this kind of Grape, well ripened and coloured. Other Black Hamburghs were furnished by Mr. Taylor, gr. to J. Coster, Esq., of Streatham; Mr. Gerrie, gr. to Sir J.

Cathcart, Bart.; Mr. Barnes, gr. to T. C. Whitmore, Esq.; Mr. Munro, gr. to Mrs. Oddie; Mr. Mitchell, gr. to H. J. Charlton, Esq.; Mr. Smith, gr. to S. Ricardo, Esq.; Mr. Foggo, gr. to the Marquis of Abercorn; Mr. Meyers, of Brentford (badly coloured); Mr. Mitchell, of Brighton; Mr. Chapman, of South Lambeth; and a seedling called Richmond Villa Black Hamburgh, from Mr. Judson, of Brighton. Fair examples of Black Prince were communicated by Mr. Lushy, gr. to J. Hill, Esq.; Mr. Monro, gr. to the Earl of Clarendon; and Mr. M'Walter, gr. to Col. Challoner. Exhibitions of West's St. Peter's came from Mr. Rust, gr. to J. Maclaren, Esq., and Mr. Turnbull, gr. to the Duke of Marlborough; but they were wrongly entered, and were, on that account, disqualified. A variety of Hamburgh called Mill Hill was shown by Mr. Wilmot. By far the best Muscat Grapes exhibited came from Mr. Woodham Death, of Nettleswell, Harlow. These were magnificent bunches, well filled with large berries, perfectly ripe, and well coloured. The next in point of merit were furnished by Mr. Taylor, gr. to J. Coster; and three somewhat small but quite ripe bunches came from Mr. Fleming, gr. to the Duke of Sutherland, at Trentham. Good fruit of the same kind of Grape, but not fully ripened, was produced by Mr. Barnes, gr. to T. C. Whitmore, Esq.; Mr. Henderson, gr. to Sir G. Beaumont, Bart.; Mr. Rust, gr. to J. Maclaren, Esq.; Mr. Thomson, gr. to Mrs. Byng, of Wrotham Park; Mr. Boyd, gr. to Viscount Dillon; Mr. Monro, gr. to the Earl of Clarendon; Mr. W'Walter, gr. to Colonel Challoner; and Mr. Kemp, gr. to Mrs. Grillion. The best white Muscadines were shown by Mr. Williams, gr. to C. B. Warner, Esq. The second best by Mr. Robertson, gr. to Lady Emily Foley, Stoke Edith Park, Ledbury. Mr. Smith, gr. to A. Anderson, Esq., had the third best dish. Good Sweetwaters came from Mr. Chapman, of Vauxhall, and Mr. Wilmot, who had also a variety of Grape called Ackbar-khan. Mr. Henderson, gr. to Sir G. Beaumont, Bart, exhibited beautiful specimens of Grizzly Frontignan; and Mr. Munro, gr. to Mrs. Oddie, and Mr. Gadd, of Betchworth Castle, of White Frontignan. Black Frontignans are rarely seen so black as those which were furnished by Mr. Watson, gr. to Mrs. Tredwell, of Norwood; Syrian by Mr. Munro, gr. to Mrs. Oddie, and Sweetwater by Mr. Riddell, gr. to T. Ashby, Esq. The heaviest single bunch of Grapes consisted of a Syrian, 3 lbs. 10 oz., from Mr. Smith, gr. to S. Ricardo, Esq., of Sunninghill; this, it may be remarked, was no great weight for this kind of Grape, for a bunch of it, grown by Speechley, at Welbeck, in the last century, weighed 19½ lbs. An equal award was made to a beautiful bunch of Black Hamburgh, weighing 3 lbs. 8 oz., from Mr. Fleming, gr. to the Duke of Sutherland at Trentham. Mr. Henderson, gr. to Sir G. Beaumont, had a bunch of Black Hamburgh weighing 3 lbs. 1 oz.; Mr. Thomson, gr. to Mrs. Byng, one of White Muscat, 3 lbs.; Mr. Slowe, gr. to W. R. Baker, Esq., one of Black Hamburgh, 2 lbs. 9½ oz., but not sufficiently well coloured; Mr. Monks, gr. to J. M. Fountain, Esq., one of Syrian (?), 2 lbs. 8 oz.; Mr. Haywood, gr. to G. R. Goodman, Esq., one of Black Hamburgh, 2 lbs. 13 oz.; and finally one of Black Hamburgh was sent by Mr. Wilmot, being part of a second crop obtained from the same Vines since Christmas. Grapes in pots, bearing large bunches, composed of finely swelled and well coloured berries, were exhibited by Mr. Smith, gr. to S. Ricardo, Esq., of Titness Park, Sunning-hill. We observed that they had been grown according to the coiling system; and certainly they were the best exhibition of Vines in pots we have seen for many years.

PEACHES.—Mr. Ingram, gr. to her Majesty at Frogmore, sent excellent specimens of Bellegarde *alias* Violette Hâtive; Mr. Snow, gr. to the Earl de Grey, nearly as good samples of the same variety; and Mr. Spencer, gr. to the Marquis of Lansdowne, Royal George and Noblesse, beautifully swelled and coloured. The latter varieties were also produced by Mr. Drummond, of Pontypool Park. Royal George came from Mr. Davis, gr. to J. Dixon, Esq.; Mr. Munro, gr. to Mrs. Oddie; Mr. Henderson, gr. to Sir G. Beaumont, Bart.; and Mr. Foggo, gr. to the Marquis of Abercorn. Mr. Parker, gr. to J. H. Oughton, Esq, had finely coloured fruit of Bellegarde *alias* Galland; and the same sort was exhibited by Mr. Monro, gr. to the Earl of Clarendon; Mr. Turnbull, gr. to the Duke of Marlborough, sent Early Purple; Mr. Cox, gr. to J. Taylor, Esq., Bellegarde; Mr. M'Walter, gr. to Col. Challoner, Bellegarde; Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, Noblesse; Mr. Slowe, gr. to W. R. Baker, Esq., Bellegarde; and Mr. Davis, of Oak-hill, Noblesse. Of Peaches in pots only one specimen was exhibited, and the crop on that, though fair, was very unripe; in fact the variety, the old Newington, a clingstone, is unworthy of such care. It was sent by Mr. Munro, gr. to Mrs. Oddie.

NECTARINES.—Beautiful examples of Elruge were produced by Mr. Turnbull, gr. to the Duke of Marlborough, at Blenheim; and Mr. Parker, gr. to J. H. Oughton, Esq., had finely swelled and well coloured dishes of Violette Hâtive, Elruge, and Tawney; Mr. Davis, of Oak-hill, sent Elruge, and the same variety was shown by Mr. Fleming, gr. to the Duke of Sutherland. Mr. Henderson, gr. to Sir George Beaumont, Bart., had Violette Hâtive; Mr. Munro, gr. to Mrs. Oddie, Red Roman; Mr. Cox, gr. to J. Taylor, Esq., Pitmaston Orange; and Mr. M'Walter, Elruge.

FIGS.—Brown Turkey were exhibited by Mr. Gerrie, gr. to Sir J. Cathcart, Bart.; and Marseilles by Mr. Foggo, gr. to the Marquis of Abercorn.

MELONS.—The first prize for the best flavoured Melon was awarded to Mr. Barnes, gr. to R. Hanbury, Esq., for a well ripened Bromham-hall; second to Mr. Elliott, gr. to J. B. Boothby, Esq., for another fruit of the same variety; and third to Mr. Balls, gr. to H. Rogers, Esq., for Napoleon green-fleshed. Mr. Gadd, of Betchworth Castle, obtained the first prize in the Market Gardeners' class, for a Beechwood. Among the other kinds shown for fine flavour were the Trentham Hybrid, Sweet Ispahan, Improved Green-fleshed, Duncan's ditto, Drummond's Scarlet, Golden Perfection, Weir's Prolific, Egyptian Green-fleshed, Bailey's ditto, and some others. The heaviest Melon was a green-fleshed Cabul, 9 lbs. 10 oz., from Mr. Davis, gr. to J. Dixon, Esq.; and the next heaviest a Cantilupe, 4 lbs. 5 oz., from Mr. Gadd, of Betchworth Castle, Dorking.

CHERRIES.—Black Tartarians were exhibited by Mr. Snow, gr. to Earl de Grey; and black Circassian by Mr. Whiting, gr. to H. T. Hope, Esq., of the Deepdene. In the Market Gardeners' class the same variety was communicated by Mr. Meyers, of Brentford, and Mr. Gainsford, of the same place. Elton and Bigarreau were shown by Mr. Snow and Mr. Kemp, gr. to Mrs. Grillion, and the latter variety by Messrs. Smith, Whiting, and Meyers. Mr. Busby, gr. to S. Crawley, Esq., had Black Eagle, and Mr. Meyers Mayduke.

STRAWBERRIES.—British Queens, beautifully ripened, were contributed by Mr. Elliott, gr. to J. B. Boothby, Esq, and Mr. Ingram, gr. to the Marquis of Salisbury, at Hatfield. In the Market Gardeners' class, Mr. Lydiard, of Bath, had very fine examples of British Queen, Mammoth, and Eleanor; and British Queen and Albert's Queen, were produced in good condition by Mr. Beach, of Hounslow, who also showed Keens' Seedling and Turner's Pine.—British Queens were exhibited by Mr. Monro, gr. to the Earl of Clarendon; Mr. Rust, gr. to J. Maclaren, Esq.; and Mr. Slowe, gr. to W. R. Baker, Esq.—Mr. Munro, gr. to Mrs. Oddie, had Eleanor and Bicton, the latter a white variety; Mr. Kitley, of Bath, Kitley's Goliah; Mr. Wilmot, a sort called Prince Arthur; Mr. Busby, Comte de Paris, a fine looking kind, but too acid except in very bright summers; and Mr. Valentine, of Wimbledon, Eleanor.

Miscellaneous fruit consisted of Fastolff Raspberries, from Mr. Smith, gr. to S. Ricardo, Esq.; Black Currants (a seedling), from Mr. Lydiard, of Bath; Raspberries (seedling), from the same grower; and Shaddocks, from the Rev. Mr. Peck, of Houghton Rectory, Huntingdon.

Of Tropical fruits, Mr. Ivison, gr. to the Duchess Dowager of Northumberland, at Syon, contributed Nutmeg, Papaw, and Vanilla; the latter in a green state.

There were three collections of 20 STOVE and GREENHOUSE PLANTS: one from Mr. Cole, gr. to H. Colyer, Esq., of Dartford, who was first; another from Mrs. Lawrence, of Ealing Park, second; and the third from Messrs. Frazer, of Lea-bridge. The first group contained three large Allamandas, well cultivated and beautifully flowered; a charmingly blossomed Dipladenia crassinoda; Clerodendron Kæmpferi, bearing a fine spike of scarlet flowers; Crowea saligna; examples of the white and rose-coloured Vincas; beautiful plants of Ixora coccinea and crocata; Aphelexis macrantha purpurea, a splendid specimen still in fine condition, although it has been in bloom nearly all the season; three well cultivated Cape Heaths; a beautifully grown Leschenaultia formosa; Æchmea fulgens, past its best; Cyrtoceras reflexum, Dipladenia splendens, a good plant of the showy Kalosanthes coccinea, and a small Aphelexis. At the back of Mrs. Lawrence's group stood a large and handsome Stephanotis floribunda; and on either side of it a huge Allamanda. Supporting these were Pimelea decussata, Clerodendron paniculatum, with an immense panicle of flowers; the pale yellow Allamanda grandiflora, Ixora coccinea, a capital specimen; a large Phænocoma proliferum, insufficiently flowered; a large bush of the blue flowered Sollya linearis; four varieties of Cape Heath; the yellow blossomed Tristania neriifolia, nearly 5 feet high, and as much through; the same beautiful Ixora javanica noticed on a former occasion, still in good flower; also I. crocata, Franciscea augusta, an Everlasting, the yellow flowered Relhania speciosa, not a very effective exhibition plant; and the sweet smelling Sphenotoma gracilis.—In Messrs. Frazer's group were Franciscea augusta, the white blossomed Rynchospermum jasminoides, Clerodendron fallax, Crowea saligna, Tristania neriifolia, the red Ixora, Stephanotis floribunda, Sollya linearis, a variety of the showy genus Kalosanthes, a nice little Roella ciliata, the red flowered Leschenaultia, three or four Cape Heaths, a white Vinca, and a good plant of the beautiful Dipladenia crassinoda.

The best exhibition of 15 STOVE and GREENHOUSE PLANTS was produced by Mr. Green, gr. to Sir E. Antrobus, Bart. It contained a large Rondeletia speciosa, Allamanda cathartica and grandiflora, an indifferent Epacris miniata, Stephanotis floribunda, beautifully grown and flowered; the chocolate blossomed Echites atropurpurea, Kalosanthes miniata, a lovely Lisianthus Russellianus, Ixora coccinea and crocata; the handsome Pleroma elegans, a comparatively new hardy greenhouse plant, with purple blossoms, nearly as large as those of an Allamanda; a very fine Leschenaultia formosa, Dipladenia crassinoda with highly coloured flowers, and two Cape Heaths.—The next group in point of merit was contributed by Mr. Carson, gr. to W. F. G. Farmer, Esq., of Cheam. It consisted of large plants of Allamanda Schottii, A. cathartica, and Stephanotis floribunda; Scutellaria ventenati, a round bush of Polygala oppositifolia, a tolerably good Æschynanthus Lobbii, Roella ciliata, Dipladenia crassinoda, the showy Rondeletia, Leschenaultia formosa, Pimelea pubescens, the useful Franciscea augusta, a pretty well flowered Lemonia spectabilis, Kalosanthes miniata, and the showy Medinil—the latter both in flower and fruit.—Mr. Taylor, gr. to J. Coster, Esq., of Streatham, had a group in which there were Hoya carnosa, Ixora coccinea, a fine bush of the beautiful Cape Heath metulæflora bicolor, a well flowered Allamanda cathartica, Rondeletia speciosa, Phænocoma proliferum, a small Roella ciliata, Pimelea decussata, the Hoya-like Cyrtoceras reflexum, Aphelexis humilis, a small plant of the Oleander-leaved Tristania, two Cape Heaths, Sphenotoma gracilis, and a well flowered Kalosanthes coccinea.

Seven collections of 10 STOVE and GREENHOUSE PLANTS were produced. The best came from Mr. Croxford, gr. to H. H. Barnes, Esq., of Stamford-hill; it comprised well cultivated examples of Allamanda cathartica, Crowea saligna, Sollya linearis, two varieties of Kalosanthes, Phænocoma proliferum, the showy Clerodendron fallax, an Everlasting, a small Ixora coccinea, and Leschenaultia splendens.—The next group was furnished by Mr. Speed, of Edmonton; it consisted of the white and rosy-flowered Vincas, the comparatively new white-blossomed climbing plant Schubertia graveolens, Allamanda cathartica, the charming Dipladenia crassinoda, Tremandra verticillata, Struthiola ovata, a nice Chironia glutinosa, a beautiful Kalosanthes miniata, and a Cape Heath.—Mr. Watson, gr. to Mrs. Tredwell, of Norwood, sent Ixora coccinea, Stephanotis floribunda, Clerodendron fallax, an Allamanda, two Cape Heaths, a well grown but indifferently bloomed Plumbago Larpentæ; Gloriosa superba, Leschenaultia splendens, and a Begonia.—Mr. Stanly, gr. to H. Berens, Esq., produced plants of Kalosanthes coccinea, Ixora crocata, Phymatanthus tricolor, the very useful Franciscea acuminata, Clerodendron Kæmpferi, Cyrtoceras reflexum, Euphorbia splendens, Leschenaultia formosa, and Gloriosa superba.—Mr. Pamplin, of Lea-bridge-road, exhibited a beautiful Allamanda cathartica, two varieties of Kalosanthes, the rosy flowered Vinca, two Cape Heaths, Cyrtoceras reflexum, two species of Franciscea, and Pimelea hispida.—From Mr. Gerrie, gr. to Sir J. Cathcart, Bart., came a large and fine Stephanotis floribunda, two species of Allamanda, Clerodendron fallax, Sollya linearis, two Cape Heaths, Epacris miniata, and a plant of the rosy flowered Vinca.

Collections of 6 STOVE and GREENHOUSE PLANTS were communicated by Mr. Bruce, gr. to B. Miller, Esq., and Mr. Kinghorn, gr. to the Earl of Kilmorey. The former had the beautiful two-coloured variety of Erica metulæflora; an Everlasting; the showy Rondeletia, Astelma eximium, Stephanotis floribunda, and the scarlet Ixora. Mr. Kinghorn sent Erica metulæflora bicolor, almost without colour; Allamanda cathartica, an Everlasting, Leschenaultia formosa and arcuata, and the beautiful Tremandra verticillata.

HELICHRYSUMS were exhibited by Messrs. Green, Stanly, Cole, and Young. The varieties consisted of Aphelexis sesamoides, s. purpurea, s. superba, s. rosea, humilis, macrantha purpurea, spectabilis, and its large flowered variety.

ORCHIDS.—Of these universal favourites there was a large and fine display. In collections of 20 species, Mr. Mylam, gr. to S. Rucker, Esq., was first, and Mr. Williams, gr. to C. B. Warner, Esq., second. Mr. Mylam sent the red variety of Saccolabium guttatum, with three charming racemes of flowers; Lycaste tetragona, quite a mass of blossoms; Oncidium Lanceanum; Epidendrum verrucosum, having a strong spike of flowers; the delicate white Aganisia pulchella, a small plant of Miltonia spectabilis, the yellow flowered Cattleya citrina, a beautiful example of Phalænopsis grandiflora, the curious green-flowered Cycnoches chlorochilon, Aerides maculosum and quinquevulnera, the latter not sufficiently in flower; Odontoglossum hastilabium, bearing a fine spike of blossoms; a large Sobralia macrantha, the singular looking Coryanthes maculata, the chocolate coloured Paphinia cristata; the Blume Saccolabe, the Bearded Lady's Slipper (Cypripedium barbatum), with some dozen flowers on it; Cœlogyne speciosa; and last, but not least, the beautiful Vanda Batemanni, with a strong spike of flowers, which were, however, not nearly all open.—Mr. Williams produced four species of the charming genus Aerides; Epidendrum varicosum and radiatum, the latter bearing 12 flower spikes; the three-coloured Vanda (V. tricolor); Oncidium pulvinatum, and the large flowered variety of O. papilio; Miltonia spectabilis, the Bearded Lady's Slipper, Brassia Wrayæ, the curious Cycnoches ventricosum, Phalænopsis grandiflora, Barkeria spectabilis, Saccolabium guttatum, Broughtonia sanguinea, Dendrobium densiflorum, and one or two other plants.

Collections of 15 ORCHIDS were shown by Messrs. Rollisson, of Tooting, and Mr. Dobson, gr. to Mr. Beck, of Isleworth. The former had a lovely Cattleya crispa, with nine spikes of flowers; Stanhopea tigrina, finely blossomed; a very fine Miltonia spectabilis, with some three dozen flowers; Stanhopea Wardii, and the charming S. Devoniensis; the white variety of Sobralia liliastrum, Phalænopsis grandiflora, the rare Aerides quinquevulnera, Coryanthes macrantha, the violet variety of Oncidium Lanceanum, Calanthe furcata, with 11 flower spikes; Cattleya Mossiæ, Odontoglossum citrosmum, well coloured; the green tailed Dendrochilum filiforme; and Huntleya violacea, with four flowers

resembling as many violet coloured bivalved shells. Mr. Dobson's plants consisted of the fine Oncidium ampliatum majus, which has been so often exhibited this season, and which is still in good flower; O. luridum and O. papilio, Epidendrum vitellinum, cochleatum, phœniceum and crassifolium, the latter beautifully flowered; a variety of Cattleya Mossiæ, Oncidium Harrisonii, with five flower spikes; Aerides odoratum, the odd-looking Promenæa stapelioides, Zygopetalum rostratum, Galeandra Baueri, the curious Cirrhæa tristis, and an Epidendrum in the way of phœniceum.

Groups of 10 ORCHIDS were furnished by Mr. Blake, gr. to J. H. Schröder, Esq.; Mr. Carson, gr. to W. F. G. Farmer, Esq.; and Mr. Franklin, gr. to Mrs. Lawrence.—Mr. Schröder had a large Aerides odoratum, A. quinquevulnera, the charming Dendrobium chrysanthum, the rather scarce Calanthe Masuca, the large flowered Phalænopsis, a beautifully cultivated twisted Trichopil (T. tortilis), Bauer's Galeandra, Angræcum caudatum, Oncidium Lanceanum, and Vanda tricolor.—Mr. Carson produced a very large Sobralia macrantha, with five flowers; Aerides odoratum, roseum, and quinquevulnera; Zygopetalum rostratum, the Bearded Lady's Slipper (Cypripedium barbatum), Cœlogyne speciosa, with 10 curious brown and buff flowers; the best variety of Odontoglossum grande, Cycnoches Loddigesii, and a plant of Dendrobium chrysanthum.—Mrs. Lawrence's plants contained Brassia Wrayæ, Calanthe veratrifolia, Odontoglossum hastilabium, and another kind like grande, without the brown colour; the yellow blossomed Cattleya citrina, Angræcum caudatum, the beautiful yellow flowered Anguloa Clowesii, with three blossoms; a small Saccolabium Blumei, an Epidendrum, and a white flowered Angræcum.

Collections of 6 ORCHIDS were produced by Messrs. Green, Gerrie, Woolley, and O'Brien.—Mr. Green sent a tall Aerides odoratum, Epidendrum cinnabarinum and crassifolium, Stanhopea saccata; Oncidium Papilio and a beautiful Oncidium Lanceanum. Mr. Gerrie showed a finely bloomed Stanhopea oculata; Oncidium pulvinatum, a mass of yellow flowers; a small, but well coloured Odontoglossum citrosmum; the long-tailed Brassia (B. caudata) with nine flower spikes; Oncidium Wentworthianum and a tall Dendrobium aduncum. Mr. Woolley produced Cattleya Forbesii with six flower spikes; the white-lipped Oncidium (O. leucochilum;) Aerides odoratum; Cymbidium aloefolium, well flowered; Epidendrum cochleatum; and a nice Oncidium pulvinatum. Mr. O'Brien contributed a small Phaius albus; the purplish-lilac Calanthe Masuca; Dendrobium formosum; a small Miltonia spectabilis; Maxillaria Brocklehurstiana; and Oncidium cornigerum. Mr. Kinghorn exhibited as a single specimen a well-flowered plant of Phalænopsis grandiflora.

CAPE HEATHS were numerous, and in capital condition. Collections of 10 were shown by Mr. Smith, gr. to W. Quilter, Esq., of Norwood; Mr. Mylam, gr. to S. Rucker, Esq.; and Mr. Cole, gr. to H. Colyer, Esq. Mr. Smith had large and fine plants of obbata umbellata, a variety of tricolor, metulæflora, Bergiana covered with small round purple blossoms; infundibuliformis, Irbyana, Lee's tricolor, tricolor elegans, Massoni, and the larger variety of retorta.—Mr. Rucker's plants, which were little inferior to the above, consisted of inflata, retorta major, Savileana, Parmentieri rosea, Veitch's variety of obbata, a very large flowered Heath; Cavendishii, infundibuliformis, Irbyana, Vernoni, and eximia.—Mr. Cole sent the larger variety of retorta, Savileana, Shannoni, tricolor, Parmentieri, the red variety of ampullacea, jasminiflora alba, flammea, the charming metulæflora bicolor, and ampullacea elegans.—In the Nurserymen's Class, Mr. Epps, of Maidstone, showed admirable plants of tricolor superba, t. Jacksoni, Parmentieri rosea, Shannoni, the two-coloured variety of metulæflora, inflata alba, the larger flowered retorta, Lee's tricolor, and eximia.—Messrs Rollisson had obbata umbellata, jubata multiflora and superba; ferruginea, a fine specimen; ampullacea tincta, reflexa, the rosy variety of Parmentieri, Aldersoni, mutabilis, and Irbyana.—Messrs. Fairbairn produced Irbyana, infundibuliformis, viridiflora, Cavendishii, the larger variety of retorta, tricolor elegans, eximia, depressa, juliana, and Shannoni.—The plants in 11-inch pots, though small compared with the others, were beautifully grown and flowered. In this class Mr. Smith, gr. to W. Quilter, Esq., showed Easoniana, a variety of princeps, ventricosa perspicua, tricolor Wilsoni, t. Dunbariana, t. superba, and t. impressa; Parmentieri rosea, the odd-looking sanguinolenta, and Savileana major.—Mr. Cole produced Irbyana, Savileana, tricolor rubra, t. Leeana, jasminiflora alba, Shannoni, ampullacea, ferruginea, and Parmentieri rosea.—The first prize in the Nurserymen's Class was awarded to Messrs. Rollisson for neat plants of Lee's tricolor, ampullacea, Candolleana, juliana, Evansiana, jasminiflora, obbata umbellata, miniata, Cavendishii, and ferruginea. 2d to Mr. Epps, for tricolor Dunbariana, t. Wilsoni, obbata, Savileana, gemmifera, ampullacea vittata, the large flowered varieties of retorta and ampullacea, Cavendishii, and perspicua rosea.—Messrs. Fairbairn showed the larger variety of Mason's Heath, gemmifera, ampullacea major, eximia, Mr. Holford's tricolor, t. elegans, t. Dunbariana, Shannoni, the large variety of Savileana, and Jacksoni.—Among the varieties furnished by Messrs. Pamplin and Mr. O'Brien, gr. to G. Read, Esq., were ventricosa superba and hirsuta; juliana, jasminiflora alba, Parmentieri rosea, Irbyana, rubens, Cavendishii, tricolor elegans, the ever-blooming mutabilis, retorta major, Coventryana, depressa, eximia, and Sprengelii.

ROSES (cut) were shown in abundance, and though their freshness and beauty were much impaired by the heat of the day, they formed an attractive portion of the exhibition. Prizes were awarded for 50 varieties to Messrs. Lane, Paul, Francis, Spriggins, and Foster; and for 25 varieties to A. Rowland, Esq., of Lewisham; Mr. Slowe, gr. to W. R. Baker, Esq.; Mr. Tivey, gr. to T. Wigelin, Esq.; and Mr. Ayre, gr. to A. Currie, Esq. An exhibition from Mr. Terry, gr. to Lady Puller, of Youngsbury, Herts, was disqualified, on account of its containing the same Rose under two different names. Among Messrs. Lane's varieties we remarked excellent blooms of the following—*Gallica:* Ohl, shaded lake; Pharericus, large crimson. *Alba:* Madame Audiot, creamy white, blush centre. *Hybrid Provins:* General Jacqueminot, large shaded lake. *Hybrid Bourbon:* Chênedollé, brilliant crimson; Comtesse Molé, delicate rosy pink; Coupe d'Hebe, and Paul Ricant. *Damask:* Madame Zoutman, creamy white. *Hybrid Perpetual:* Armandine, pink; Chateaubriand, large delicate pink; Comte de Montalivet, rosy crimson; Duchesse de Galliera, shaded pink; Duchesse de Praslin, blush, with pink centre; Duchess of Sutherland, Madame Trudeaux, carmine; Sidonie, large pink; and the brilliant Standard of Marengo. Among Bourbons, the most conspicuous was the well-known Rose, Dupetit Thouars. The same nurserymen had also beautiful exhibitions of Géant des Batailles, the most brilliant of all Roses, Queen, and Baronne Prevost; and Messrs. Curtis and Co., of Bristol, sent charming boxes of Devoniensis and Géant des Batailles. The 12 best Roses exhibited by Messrs. Paul were—*Damask:* Madame Hardy. *Alba:* Felicité Parmentier. *Hybrid Perpetual:* Julie de Krudner, Duchess of Sutherland, Baronne Prevost, La Reine, Sidonie, Pius IX., Gen. Negrier, and Duchesse de Montpensier. *Hybrid China:* Gen. Jacqueminot and Lamoriciere.

SINGLE SPECIMENS.—The best consisted of the charming orange-blossomed Rhododendron javanicum, from Messrs. Veitch; Kalosanthes coccinea, from Messrs. Frazer; huge plants of Stephanotis floribunda and of Sollya linearis, and a beautiful Ixora javanica, from Mr. May, gr. to Mrs. Lawrence; a magnificent example of Lisianthus Russéllianus from Mr. Green, gr. to Sir E. Antrobus, Bart.; Erica Parmentieri rosea from Mr. Dennett, gr. to W. Gillet, Esq.; E. ferruginea, from Mr. Epps; Curcuma Roscoeana, cordata, and Pleroma elegans, from Mr. Ivison, gr. to the Duchess Dowager of Northumberland; plants of Kalosanthes from Mr. Cole and Messrs. Frazer; and Stephanotis floribunda from Mr. Bruce.

NEW PLANTS.—Those to which prizes were awarded were Ixora salicifolia, from Messrs. Veitch; an Acineta, from Messrs. Lane; and Cattleya Mossiæ alba, from Mr. Ivison, gr. to the Duchess Dowager of Northumberland. A nice plant of the yellow-flowered Luxembourgia speciosa was produced by Messrs. Rollisson; but on account of its having been shown in the garden in former years it was unnoticed by the judges. Achimenes Tugwelliana, from Mr. Glendinning, was misplaced in this class. Other plants, shown as new, were Echites Franciscea, white with a rosy centre, from Mr. Cole; Thyrsacanthus bracteolatus; a small yellow-flowered plant called Achyranthes, to which it bore the same resemblance that Monmouth does to Macedon; and a variety of Cattleya crispa, from Messrs. Rollisson; a Lycaste, from Mr. Carson; a Cattleya, from Santa Martha; and two leaves, each measuring nearly 6 feet across, and a flower of Victoria Regia, from Mr. Ivison; and Griffonia Liboniana, from Mr. Salter, of Hammersmith.

MISCELLANEOUS SUBJECTS comprised a collection of Verbenas from Mr. Smith, of Hornsey; Petunias from Mr. Gadd, gr. to T. J. Lenox, Esq.; Antirrhinums from Mr. Wooler, of Tulse-hill; and Alpines from Mr. Wood, of Norwood, and Mr. Turner, of Holloway.

HOTHOUSE FERNS.—Collections were shown by Messrs. Williams, Woolley, and O'Brien. The following are among the best that were exhibited: Adiantum cuneatum, trapeziforme, macrophyllum, pubescens, and formosum; Pteris vespertilionis; Blechnum brasiliense, Aspidium augesens, and Polypodium effusum.

ACHIMENES were produced in quantity, and the plants were generally well grown. The first prize for them was awarded to Mr. Dobson; the second to Mr. Knott, gr. to the Rev. Mr. Pritchard; and the third to Mr. Ivison. The sorts were not different from those usually cultivated.

Mr. Glendinning had a small group of Statices, among which we remarked arborea, frutescens, mucronata, sinuata, puberula, and Fortuni.

NEW CONIFERS.—Only one collection was shown, and that was partly unnamed and of little interest.

NEW HARDY EVERGREENS consisted of Ceanothus papillosus, cuneatus, dentatus, rigidus, and integerrimus; Berberis Leschenaultii, Myrica californica, Laurus regalis, the Californian Evergreen Plum (Cerasus ilicifolia), Rhamnus californicus, and an Arbutus like Procera, from Mr. Glendinning.

PELARGONIUMS were much finer than they are usually seen in July. Messrs. Stains' and Parker's plants were in first-rate condition, and covered with large fresh flowers. The Fancies were not so gay as we have seen them earlier in the season. Plants in 11 inch pots. Mr. Parker had Rosetta, Pearl, Emperor, Louisa, Rosy Circle, and Armada. Mr. Stains, Armada, Centurion, Lamartine, Armada superb, Gulielma, and Pearl. Nurserymen: Mr. Gaines sent Meleager, Negress, Chieftain, Lord Warden, Oriflame, and Rosy Circle. Six plants in 8 inch pots: Mr. Stains produced Constance, Brilliant (Topping), Narcissus, Ariel, Conspicuum, and Pearl. Mr. Cock, Centurion, Sundown, Star, Meleager, Ondine, and Sikh. Mr. Robinson, Mars, Cassandra, Senata, Paragon, Ariel, Rowena. Nurserymen: Mr. Beck had Governor, Painter, Cuyp, Vanguard, Loveliness, and Star. Mr. Bragg, Ondine, Conspicuum, Alderman, Azure, Voltigeur, and Countess of Sefton. Mr. Gaines, Aspasia, Star, Mars, Flying Dutchman, Excelsa, and Marchioness of Stafford.

FANCY PELARGONIUMS.—Mr. Stains sent Hero of Surrey, Reine des Français, Magnifica, Queen Superb, Boquet tout fait, and Fairy Queen. Mr. Gaines, Wintonia, Orestes, Fairy Queen, Reine des Français, Alboni, and Hero of Surrey. Mr. Ambrose, Juno, Pilot, Enchantress, Magnet, Standard, and Pride of Surrey.

CAPE PELARGONIUMS.—Mr. Stains showed Tripinnatifidum, Sæpeflorens, Blandfordianum, Ardens, Quinquevulnerum, and Ardens major. Mr. Stanley, Tricolor, Lobatum, Ardens, Blandfordianum, and Elatum Bicolor.

FUCHSIAS.—Some were shown, but we cannot say that they were very creditable specimens of cultivation. They were of all sizes—some very tall, others very short—some trained like parasols, others to single stems, and some had few sticks, while others had almost more sticks than branches. Under such circumstances it will be easily imagined that they did not make a very effective display. The best came from Mrs. Lawrence's garden at Ealing-park; a second group from Mr. Salter, of Hammersmith; and a third from Mr. Gregory, of Cirencester.

CARNATIONS AND PICOTEES.—Blooms of these were tolerably numerous, but they were small and inferior. Messrs. Edwards, Newhall, and Ellis, were the only amateurs, and Messrs. Ward, Norman, Willmer, and Bragg, the nurserymen that exhibited. The following are a few of the best kinds shown. Scarlet Bizarres: True Briton, Admiral Curzon, Regular, Prince Albert. Crimson Bizarres: Edgar, Prince Albert, Count Pauline, Sir J. Reynolds, Georgiana. Purple Flakes: Earl Spencer, Squire Trow, Queen of Purples, Beauty of Woodhouse, Majestic. Scarlet Flakes: Queen Victoria, Pet, Orlando, Dido, Ulysses. Rose Flakes: Lorenzo, Flora's Garland, Margaret Evans, Gen. Moore, Ariel, Prince Arthur. PICOTEES.—Rose and Scarlet Edge: Venus, Mrs. Barnard, Heroine, Rosalind. Purple Edge: Beauty, Duke of Newcastle, Portia, Amethyst, Constance, Enchantress. Red Edge: Mary Ann (Parkinson), Isabella, Miss Burdett Coutts, Emma.

SEEDLING FLORISTS' FLOWERS.—Of Pelargoniums scarcely any were shown, with the exception of a few fancy varieties sent by Mr. Ambrose, the best of which were Eclipse, Monarch, Baudoin, and Crimson King. Carnations: May's Romeo and Antonio, both rose flakes, are large fine flowers, with good white, and well marked; they are also smooth on the edges; Puxley's Mars is a promising scarlet flake. Picotees: Dodwell's Mary, red edge; Alfred, purple; Matthews' Juno, ditto, were shown in good order, being large, with good distinct edges, and much superior to any of the same class in the stands for competition.—Mr. G. Smith sent his Fuchsia Sedonia, a showy kind, having a full-sized purple corolla, with sepals well reflexed; the size and colour of the tube are deficient and bad; there is also a want of substance. Banks' Expansion, noticed before by us, was shown in admirable condition; the purity and stoutness of this flower, combined with the freeness of bloom, makes it very desirable. There were a few Verbenas, some Petunias, with various unimportant seedlings of a miscellaneous kind. Messrs. Lee had their variegated Scarlet Geranium "Flower of the Day," which would please those who are fond of variegated plants.

Reviews.

The Tourists' Flora; a Descriptive Catalogue of the Flowering Plants and Ferns of the British Islands, France, Germany, Switzerland, Italy, and the Italian Islands. By Jos. Wood. 8vo. London, Reeve. Pp. 504.

WE are so often asked what botanical book it is most convenient for a traveller to select as his companion in a continental tour, that we hail with pleasure an English work which we can recommend instead of Koch or Reichenbach. Mr. Wood is a well-known pains-taking botanist, observing facts carefully, and putting them together with good faith and originality; but deficient in the power of generalising, and prone to over-estimate the value of those superficial peculiarities by which some modern botanists think species are to be distinguished. We are, however, bound to say that there is small evidence of this tendency in the work before us, in which we find little to criticise and much to praise.

The author introduces the subject with a discussion concerning the precise meaning to be attached to certain adjectives used in a technical sense, and in doing this he will probably have offered his readers a kind of aid that is by no means unwelcome; and then follows a carefully constructed table of genera, arranged upon the Linnean system, for the use of the wading botanists who dare not venture into deep water. The bulk of the book consists of the genera and species arranged according to the Natural System.

The work forms a handsome octavo volume, is beautifully printed on good paper, and is completed by a very full and careful index.

Review.

We are glad to find that the Supplement to the new edition of *Loudon's Hortus Britannicus* is to be issued separately, as well as in conjunction with the reprint of the old Catalogue. This makes the new work applicable to all of the first edition that remains in the hands of the public, and will, we have no doubt, be welcome news to great numbers of gardeners.

Miscellaneous.

Mr. Epps's Heaths.—Upwards of 70 of Mr. Epps's best specimens were sold by Mr. Stevens, on Tuesday last. The following will give some idea of the kind of prices they fetched:—Parmentieri rosea, 10*l.* 10*s.*; Cavendishii, 8*l.* 10*s.*; aristata major, 7*l.* 10*s.*; metulæflora bicolor, 7*l.*; retorta major, 6*l.*; ferruginea, 6*l.* 10*s.*; Jackson's Tricolor, No. 2, 5*l.*; splendens, 5*l.* 10*s.*; Clowesiana, 4*l.* 10*s.*; Shannoni, 4*l.*; halicacaba, ditto; Templeana, 3*l.* 3*s.*; delecta, 3*l.* 10*s.*; propendens, 4*l.*; fastigiata lutescens, 3*l.* 3*s.*; ventricosa coccinea minor, 4*l.* 10*s.*; perspicua nana, 3*l.* 15*s.*; inflata alba, 3*l.*; ampullacea elegans, 2*l.* 12*s.* 6*d.*; eximia, ditto; Savileana major, 2*l.* 6*s.*; Ewerana, ditto; other lots realised from 15*s.* to 2*l.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Do not allow any of the transient summer beauties to remain in the flower-houses longer than they are ornamental; and those which have been grown as annuals, to serve merely for a season, should be thrown away when they cease to be useful; for, if kept beyond a certain stage, they only engender filth and harbour insects. That portion of the Gloxinias, Achimenes, and other bulbs, requiring a season of rest, which are now becoming shabby in appearance, should be placed in a close frame, where they can be ripened off by gradually diminishing the quantity of water. It is seldom necessary to extend this care to the whole of the stock, as a few of the best pots of each kind will furnish enough to work from next year. Take care that these plants are correctly labelled before their foliage is destroyed; and mention on the label the date when put to rest, that they may be excited in the same rotation next year. By going over the stock in this manner, more room will be gained for those plants which are being grown for autumn and winter. These should enjoy a rather freer admission of air during the day, that they may be gradually inured to a cooler temperature than that in which they have been growing for the last three months. The same course of treatment must be pursued with stove plants in general, especially with those which have completed a growth for next year's flowering; these may be placed on the spare shelves of a greenhouse, from which the plants have been removed. In this situation they must have abundance of air, except when the weather is cold or windy. Greenhouse plants require similar attention in everything except temperature, which should be kept as low as possible, unless for plants which it is desirable to bring quickly into flower. On fine afternoons syringe overhead with a fine rose all plants which are under artificial covering. In fine warm nights it will be of great benefit to remove the glass or other covering, that the plants may be refreshed by the evening dew; and also during warm gentle summer showers. Some of the earliest specimens of the Lilium lancifolium and varieties will soon be coming into flower. Place them in a situation in the conservatory, where the sun's rays will not act too powerfully upon them. Supply them with sufficient water, and occasionally with liquid manure, that their flowers may be prolonged, and enhanced in brilliancy; and also that their foliage may be preserved.

FORCING DEPARTMENT.

PINERIES.—Give every encouragement to those plants which are now showing and swelling, by means of a moist high day temperature and good bottom-heat, and by shading during very warm weather. If the quantity of fruit which has already made its appearance is inadequate to meet your probable requirements during winter, water may for a short time be withheld from a portion of the plants which are fittest for fruiting. On the other hand carefully avoid any check to those which it is desirable to keep on in a growing state. VINERIES.—In the late Vineries the Grapes which are required to hang till the new year should be well thinned, and the shoulders tied out, so as to ensure a free circulation of air amongst the berries, that their skin and footstalks may be better matured, and less liable to decay during winter. The potting of Strawberries for forcing should be proceeded with as soon as the young plants have made sufficient roots to allow of their being transferred to the pots with nice little balls of soil, which will adhere to them if taken carefully up with a curved trowel. We prefer this plan to laying them in small pots, as it saves time and pots, and succeeds perfectly. The soil for forcing Strawberries should be of rather a strong loamy nature, and have some well rotted cow or horse-dung added to it. Take pains to make the drainage very perfect, as it is necessary to give a considerable quantity of water during their growth through the autumn, and when they are being forced next season; and if the drainage is defective, the health of the plants must suffer. Some gardeners do not pot their plants till September, but we prefer doing it as early as we can, placing them at once into the size of pot in which we intend them to fruit, or putting them into 4 or 5-inch pots, and shifting them, in a fortnight or three weeks, into 7-inch pots. A portion of the healthiest plants of those which were forced last season should be immediately shaken out of the old soil, soaked in water, repotted in rather larger pots, and set on beds of coal-ashes in an open situation. During summer the runners must be regularly moved, and the growth of the plants encouraged by occasional waterings of liquid manure. As habit becomes a second nature to plants, these Strawberries will complete their growth much earlier than those raised from the present year's runners, and, if carefully attended to with regard to water, they will be better prepared for an early excitement.

FLOWER GARDEN AND SHRUBBERIES.

Those who can spare time for budding Roses will, of course, be busy with that operation, selecting moist weather for the purpose. Very interesting specimens for the flower garden may be created by budding some of the choicer Perpetuals, Bourbons, and other autumn-flowering varieties, upon the strong young shoots of the climbing species, which have formed such attractive objects during the last few weeks. By allowing a portion of the spurs of the original variety to remain, a pleasing succession of bloom will be obtained from early summer to late autumn. The propagation of hardy plants should now be energetically proceeded with. After the smaller matters, such as Phloxes, Antirrhinums, Pentstemons, &c., are completed, cuttings should be taken of all the choice kinds of Roses which it is desirable to increase; and if this is done immediately they will have time to form fine plants before winter. They will strike pretty freely in a close frame on the north side of a wall, or even in a shady border without a frame. If in frames, pull off the sashes every evening, that they may be refreshed by the night dews. We never yet saw a pleasure ground or flower garden which contained a superabundance of Roses; but we would direct particular attention to the early-flowering climbing Roses, than which nothing can be more beautiful when they are tastefully arranged. In selecting the varieties for extensive cultivation, those should be chosen which, in addition to their beauty, are found most able to endure the severity of the winter unchecked, and which are least liable to be affected with mildew during summer, as varieties differ very much in both these points, and many are found to succeed much better in some localities than in others.

FLORISTS' FLOWERS.

CARNATIONS AND PICOTEES will now claim almost undivided attention; the blooming season in the south will be at its height next week, whilst a week later may be quoted for the midland and northern counties. As the blooms expand, great care must be taken that they open regularly, and that the ties are daily examined; they should be carded, and the petals evenly placed as they unfold themselves. A liberal supply of soft water must be given, so that they may experience no check from drought. Now will be a good time to attend to the fecundation of the seed-vessels; the pointals, or horns (as they are vulgarly called), are the organs to be operated upon; the anthers containing the farina generally lie low down amongst the petals; these, when the farina appears, owing to their bursting, may be extracted with a very delicate pair of tweezers, and carefully applied to the pointals or stigmas. It will soon be ascertained whether this interesting operation has been successfully performed, as, in such a case, the petals collapse. The only thing to be attended to afterwards, is to protect them from excessive rain. RANUNCULUSES should be out of the ground forthwith. PINKS.—The pipings first struck may be planted out. The latter crop will require shading, watering, &c. Gather AURICULA and POLYANTHUS seed, as the capsules turn brown; and take care the plants do not suffer from the hot weather. DAHLIAS.—Mulch and water abundantly, &c.

HARDY FRUIT GARDEN.

Suckers should be carefully removed from fruit trees of every description; it is not sufficient merely to cut them off level with the surface of soil, as such a mode of treatment only causes them to throw up a progeny ten times more numerous. To do the thing properly, the soil should be bared away, the suckers traced back to their origin, and carefully removed with the point of a sharp knife. If any of the stone-fruit trees on the walls are of inferior varieties, they may, if kind and healthy, be budded with other and better sorts, and especially with such as are found better adapted to the peculiarities of soil and situation. The same advice applies to Apples and Pears on walls or otherwise. In all cases strong healthy shoots should be selected upon which to perform the operation. Any young stocks which are sufficiently large for the purpose should be budded immediately, and, if they fail, the stocks can be cut down in spring and grafted.

KITCHEN GARDEN.

As soon as any crop is removed, let the ground be trenched, that an air of neatness may reign over every part of the garden, that insects may be disturbed and destroyed, and that the soil may derive the advantages resulting from the action of the atmosphere. If it does not interfere with the methodical rotation of crops, let the ground be immediately planted or sown; and in such cases the two operations should proceed simultaneously, and thus prevent unnecessary treading upon the ground. Give the Celery crops one or two good waterings with liquid manure. Only those rows or beds which are intended for early use should be earthed up at present. With regard to the main crops, this operation should be postponed until the plants have attained full size, when it may be finished off at once. We find in this a considerable saving of time, and the Celery does not rot in winter. When we were in the habit of earthing the winter crops early in autumn, we frequently lost entire trenches by its rotting during winter; but since we have made it our practice to defer the operation until the end of September or beginning of October, we have lost none, and the quality is as good as we could desire it. We find the same practice equally good with regard to Cardoons.

State of the Weather near London, for the week ending July 18, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 25th 1844—therm. 92 deg.; and the lowest on the 24th, 1838—therm. 40 deg.

Notices to Correspondents.

ARAUCARIA IMBRICATA: *J S.* Turn your seedlings out of the box they are now in, pot them singly in small pots, in yellow fibry loam, and winter them in a cold frame. Keep them rather close for a few days after they have been potted, until they have become a little established in the pots. They may be planted out in the open ground next spring.‡

BOOKS: *Discipula.* There neither is nor can be such a book as you want. The price is insufficient to remunerate a publisher. The cheapest and best book is Baxter's "British Flowering Plants." Your bookseller had better ascertain for you the price of coloured and uncoloured copies.

DELPHINIUMS: *W.* They will succeed in almost any soil; but a rich friable loam, and a situation open to the sun, suit them best. They are improved by adding thoroughly rotten manure freely to the soil in which they grow. Your light soil is possibly too poor for them. The sorts you mention may be taken up and divided in spring just when they begin to grow.‡

GLASS: *C.* The largest squares are the best, provided you secure abundant ventilation to compensate for that which is cut off by the loss of the open laps between small squares. As to price, you had better consult the glazier who supplies you.

LICHENS: *Limerick* asks if there is any wash that would take off small white and brown spots of Lichen, that disfigure chisselled limestone gate piers, so as to restore them to their natural colour. We have no doubt that a solution of corrosive sublimate would do it; but we cannot tell what more it might do.

MILDEW: *T H W.* The only remedy for it is sulphur, applied *the moment the mildew appears.*‡

NAMES OF PLANTS: *M.* Mimulus cardinalis.—*A C.* Epidendrum latilabrum.‡

PEAR TREES: *J K.* We should be inclined to suspect your tree of overflowering; for if you shelter it from cold, and it still drops its blossoms, there must be some deficient supply of food. Suppose you thin your fruit next year as soon as they have cast their petals.

PEAS: *J K.* We believe the best way of preserving green Peas is the following, mentioned in our vol. for 1849, p. 376.

POTATOES: *Limerick.* All the experiments upon stopping the disease, by removal of the stems, are so inconclusive that we know not what to advise. We believe the best way is to cut the stems down carefully, *as soon as the flowers begin to fade*, to cast over the rows three or four inches of earth, and to roll the land well.

ROSES: *Inquirer.* Both the flowers and foliage of the Rose are taken into account in determining the species. The Noisette is a garden hybrid. It is distinguished from others by the large clusters of flowers it produces throughout summer and autumn, and by its long shoots clothed with shining leaves. Nearly all sorts of Roses may be raised, without heat, from cuttings made between August and October. Noisette Fellenberg is a good crimson autumnal Rose, well suited for a wall.‡

ROSE LEAVES: *W M.* They are devoured by caterpillars of some sort. The mischief seems to have been done some weeks since. You must first discover your enemy, and then set about destroying him.

SASH BARS: *A P.* See advertisement, p. 322.‡

TAR: *Diss.* If you use this in your Cucumber boxes, it must be good Stockholm tar, and not coal or gas tar, the smell of which kills delicate plants.

THRIPS: *J J.* It has been stated that thrips may be killed by the use of tobacco-water to which a little sulphur has been added; or by a decoction of Elder leaves; or the infested plants, when wet, may be dusted over with flowers of sulphur, which should be allowed to remain on for three or four days, when it may be washed off. Perhaps the most certain, however, of all remedies is the odour from bruised Laurel leaves.‡

VINES: *J F.* Your Vine leaves appear as if they had imbibed some poisonous matter from the roots. The decay beginning at the bottom of the house, and progressing slowly but gradually upwards, would serve to strengthen this opinion. We can hardly imagine them to have been scorched.‡

SEEDLING FLOWERS.

ACHIMENES: *W H.* Too much dried up when received for us to offer any opinion of its merits.*

CALCEOLARIAS: *M H.* They fully maintain the character given your first lot.*

DOUBLE PANSY: *A Dods.* Pretty, and, being a profuse bloomer, may be worth cultivating.*

FUCHSIAS: *R W.* Not worth growing.*

GLOXINIAS: *T J.* They do not appear to be any improvement on kinds possessing nearly the same colours already in cultivation.*

PANSIES: *M H.* The dark variety is a promising flower, and should be grown again. The yellow-ground flower may be discarded at once, there being now so many very superior flowers in that class.*

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c., &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10 0 0
Clover Manure, do.	11 0 0
Turnip Manure, do.	7 0 0
Superphosphate of Lime	7 0 0
Sulphuric Acid and Coprolites	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.
